Mr. Greenwood, who, in the absence of Mr. H. H. Bartlett, proposed the toast, "The Houses of Parliament," said he sincerely trusted that the toast would never require alteration. One of the houses, he would not say which, as politics were strictly barred, might with much accuracy, be likened to Mr. Carmichael's horse. Each could interpret his words in his own way, and then no one would be disappointed. He thought that this toast was one which should never be omitted from the list.

Mr. G. A. Hardy, M.P., responded to the toast, and observed that the English Parliament was the envy and admiration of the world. It was remarkable for its wonderful purity, and he was assured that the charge of "jobbery" could never be brought against it.

Mr. F. G. Rice (president L.M.B.A.) rose to propose the toast, "Municipal Authorities," and said he regretted that politics entered too much into municipal life. Being themselves a benevolent body, he must try to say something in their favour. He shared with the average man the idea that Councils existed for the purpose of taxing him and his unfortunate fellow-men alone. He knew very little about municipal life, although he himself had at one time been a candidate for municipal honours, but had been defeated. He had, however, lived long enough to receive the congratulations of his friends. It was only 150 years ago that the ancient guilds, whose powers had devolved upon the corporations, could prevent at their own discretion people carrying on a trade without their consent. All this was happily at an end. He hardly knew which was the more difficult—to make tradition or to sustain tradition. Sir Melvill Beachcroft had done both with commendable ability. He wished that Sir Melvill would render even more successful his term of office by scrapping all the little building Acts and making one big comprehensive Act.

Sir Melvill Beachcroft (chairman L.C.C.) responded to the toast, and observed that he was sure they would not desire him to reply for each individual municipal authority, of which there were 103. He confessed that he had heard a great deal to surprise him. The L.C.C., even in these hard times, were expending huge sums upon new buildings, etc. The schools involved annually about half-a-million of money, and asylums accounted for a like sum. Nearly three-quarters of a million of money was being expended upon street improvements, in spite of the heavy slump. Unquestionably the trouble began in 1897, when such unusual activity took place in the building trade. They had never got over the reaction. He had taken note of several tit-bits, which he hoped to utilise during the few remaining months of his chairmanship at Spring Gardens. That humble and unfortunate body of men, lawyers, of which he was a member, themselves had two benevolent institutions for aiding those who fell out of the running.

At this juncture it was announced that the appeal for contributions in aid of the Institution had resulted in a total sum of £860 14s. 6d. Mr. Stephen Collins, M.P., then proposed the toast, "The Vice-Presidents, Committee and Stewards," which was received with much heartiness.

Mr. John T. Bolding replied in a few brief and appropriate remarks, and the company dispersed. During the intervals between some of the speeches, an excellent musical programme was given by Mr. Herbert Schartau, assisted by Miss Edith Serpell, Miss Carrie Herwin, Mr. Henry Turnpenny, and Mr. Harold Montague, the rendering of the unaccompanied quartettes being particularly fine.

Societies' Reports.

Architectural Association Debating Society

The fifth meeting of the session was held on Friday, November 26th, when a debate took place upon "Competitions Open v. Limited." Mr. K. Gammell spoke in favour of open competitions, where it was a question of public buildings to be erected with public money. In such cases he contended it was morally wrong for a public body to select a limited number of architects to compete, and it was only fair to the young and unknown architects to have an opportunity of submitting a design. An open competition was the only way of obtaining the best design. Mr. W. G. Wilson, in opposing Mr. Gammell, and speaking in favour of "limited" competitions, said that public bodies had not only to see that they obtained the best design, but that the architect was capable of carrying it out, and in this respect a competition was useless. Further, that in the case of an open competition, where there were such large numbers of designs submitted, it was, humanly speaking, impossible to say which was really the best; the competition then becomes a gamble. He also said that to contend in open competitions was not the best way for a young architect to build up a practice. Messrs. Hamp, R. Smith, Forster, Jacob, Ross and Bullock took part in the debate. Mr. A. H. Belcher was in the chair, and on a show of hands, he declared the voting to be in favour of "Open" competitions by a majority of one. The next meeting will be a joint meeting with the junior members of the Surveyors' Institution, and will be held at 18, Tufton Street, on Friday, December 17th, when Mr. Raymond Unwin will move, "That the planning of towns and estates should be designed by an architect assisted by a surveyor."

Edinburgh Association of Science and Arts.

Mr. F. A. Macdonald, C.E., Glasgow, read a paper to the members of the Edinburgh Association of Science and Arts in the National Portrait Gallery on "Reinforced Concrete Construction." Among the advantages of reinforced concrete construction were rigidity and absence of vibration, durability, no subsequent outlay for maintenance, and resistance to fire. A general definition of what was meant by reinforced concrete construction might be stated as a combination of concrete

and steel in a monolithic type of design, forming a homogeneous whole, in which the maximum of the inherent qualities of each of the two component materials was combined and fully developed. From the economic standpoint the saving of cost was not inconsiderable, and there was also a saving in deadweight, and consequent economy as regards pillars and foundations. The advantages of reinforced concrete construction had been recognised by the Government's great spending departments, and the lecturer stated that important works were shortly to be commenced in Scotland, where reinforced concrete would be largely used. Recognising the importance of some standardisation of formulæ both as a safeguard and as a guide, the Royal Institute of British Architects had issued a set of regulations, which were very valuable, and gave data which could be intelligently worked on. Mr. Macdonald hoped that still further standardisation both of formulæ and notation for the calculation of reinforced concrete structures would be eventually drawn up and their observance recognised by all designers. The lecturer also gave a full description of a special type of reinforced concrete beam as invented by himself in conjunction with Mr. Charles Baudart.

Gloucestershire Architectural Association.

An interesting lecture under the auspices of the Gloucestershire Architectural Association, was given at Northgate Mansions on Thursday evening by Mr. W. L. Bernard, F.R.I.B.A., of Bristol, upon "The Temples of Baalbec." Since visiting the ruins of Baalbec five years ago, Mr. Bernard delivered a paper before the Bristol Society of Architects, and his fascinating and instructive account of the former grandeur and present condition of these ancient temples—among the most ancient in the world—illustrated as it was by a very fine series of photographs and drawings in the form of lantern slides, was followed with close attention and keen appreciation by a good audience, which comprised members and friends of the Association. As Mr. Bernard pointed out, the history of Baalbec, which is situated in Syria, east of the Anti-Lebanons, is enshrouded in legendary tradition, but the wonders of the ruins speak for themselves, and have peculiar charm for the archæologist. Mr. H. W. Chatters, F.R.I.B.A., of Cheltenham, the president of the Association, heartily welcomed the lecturer, and at the close a vote of thanks was unanimously accorded, on the proposition of Mr. T. S. Ellis, seconded by Mr. W. B. Wood.

Leicestershire Architectural and Archæological Society.

At the bi-monthly meeting of the Leicestershire Architectural and Archæological Society, Major Freer reported that the subcommittee appointed at the last meeting to consider the question of holding a conversazione in January next had met, and, after fully discussing the question, had come to the conclusion that it would be better to postpone the same for the present.—It was resolved, however, on the proposition of Mr. Thos. Bailey, seconded by Major Freer, to refer the question to the hon. secretaries whether it would not be possible to hold the society's annual meeting on the 31st of January at the Grand Hotel, preceded by a lunch or tea, and Mr. S. Perkins Pick, F.R.I.B.A., was invited to give a lecture on "Roman Leicester" on that date, which he kindly consented to do if the arrangements were carried out.—On the proposition of Major Freer, seconded by Mr. S. P. Pick, the Rev. S. T. Winckley, M.A., was elected as excursion hon. secretary.

Leeds School of Art.

Mr. Butler Wilson delivered the second of a series of lectures on "The Arts in England at the Close of the Seventeenth Century," his subject being "Sculpture and Decorative Painting." Mr. Wilson pointed out the great dearth of sculpture pure and simple as compared with carving, which was prolific at this period. He called attention to the lead statue of James II., by Grinling Gibbons, which originally stood behind the Banqueting-house in Whitehall, but was now in front of the new Admiralty buildings in St. James's Park, and also mentioned the equestrian statue of Charles I. by G. Le Sueur, which stands on the south side of Trafalgar Square, between the Strand and Whitehall. The carving of the school of Gibbons was dealt with in great detail by the lecturer, who showed, by means of lantern slides, examples of the work from St. Paul's Cathedral, Hampton Court Palace, and St. James's, Piccadilly. The second part of the lecture was devoted to a consideration of the decorative paintings of the period. The influence of P. P. Rubens on the British school of decorative painting was more particularly illustrated by the ceiling of the Banqueting-house in Whitehall, and of this views were shown for the first time, by permission of His Majesty's Commissioner of Works (Sir Schomberg MacDonnell). Mr. Wilson also gave a number of details of the recent restoration of the ceiling, and added that the nine pictures and frames from the ceiling weighed altogether nine tons. The ceilings in the buildings designed by Inigo Jones were, it was presumed, intended to be completed by the insertion of paintings. With the restoration of the Monarchy this form of art again flourished, and none of the numerous great mansions were considered complete until they were so decorated. Unfortunately, no kind of painting in England had suffered so much from time, neglect, and demolition as had ceiling and wall paintings. The decoration of ceilings by paintings was more universal in Holland during the seventeenth century than in England, and consequently, with the accession of William III. the fashion still further increased in this country. A number of slides were shown depicting the portraits of the beauties of the Court of Charles II. now hanging in the bedroom of William III. in Hampton Court Palace, and Mr. Wilson added that by viewing these portraits one could imagine oneself transported into that mixed society of frail, beautiful, and interesting women, the professional beauties of the time.

Bradford Arts Club.

Mr. R. G. Kirby, the city architect of Bradford, delivered a lecture on November 30 to the Bradford Arts Club, on Garden Cities and Town Planning. He referred to the manner in which towns had been allowed to develop haphazard, traced the garden city movement, and gave an account of what had been done in England and on the Continent. He said that in most English towns opportunities seldom occurred for the creation of large civic centres; but in Bradford there was likely to be such an opportunity in the near future when the much-discussed and long-anticipated improved railway facilities were provided. It was to be hoped that such an opportunity would not to be allowed to pass without some open place being planned on broad lines, effectively to receive and distribute the ever-growing streams of traffic, to provide for parades, and also to show to the best advantage such public buildings as might already abut upon or be erected around it. Such a place should be monumental in character, turfed and planted with trees, in addition to providing suitable roads and ways for vehicles and pedestrians.

In connection with such a scheme it might be found possible to provide facilities for the linking up of the various tramway routes in some central exchange, so as to avoid the great inconvenience now experienced, particularly on wet or stormy nights, in passengers having to change from one car to another in crossing the city. Every citizen of Bradford should hope for a greater commercial expansion, and should have faith in a "Greater Bradford" yet to be; but unless facilities were provided for such an expansion it would be futile to expect such hopes to be realised. If a suitable area of land were acquired on the outskirts of the city—and this, he thought, would be quite feasible—it would be possible to provide sites for new factories, with adequate railway facilities. New industries might be induced to come to the city, and thus to contribute to that expansion and enhanced prosperity which was so earnestly desired by all.

The Institution of Municipal Engineers.

At the meeting of the Council of the Institution, held at 39, Victoria Street, London, S.W., on Saturday, November 27th, 16 applications for admission to membership and 3 for admission to studentship were considered. Eleven applicants were elected to membership and 3 to studentship. The roll of the Institution now stands at 641 members and 92 students, making a total of 733. The President and the two Vice-presidents of the Institution were elected as delegates of the Council of the National Association of Local Government Officers. The letter from the honorary secretary of the Municipal Engineers Imperial Defence Committee was considered, and it was decided to refer the whole matter back for further consideration. A number of letters, expressing approval of the proposed formation of an associate member class, were presented by the secretary, and further consideration of the matter was deferred. It was decided also to defer consideration of the secretary's report. Messrs. C. Owen Baines (S.W. district), T. Francis Hewitt (N.E. district), Bernard Partridge (S.E. district), and Ernest W. Veale (S. district) attended the joint meeting of Council and Honorary Secretaries of the District Committees, and, after considerable discussion, it was resolved that the secretary send to the respective hon. secretaries copy of the notes taken at the meeting, and report further at the next meeting of the Council.

Law Case.

London District Surveyor's Fees.

At Lambeth Police Court on November 30, Mr. Hopkins gave judgment in the test case of Dicksee versus Galbraith Bros., which was reported in our issue for November 24th. The point raised was whether builders erecting schools for the London County Council were liable for the district surveyor's fees. Mr. Hopkins, after reviewing the case, held that they were, and made an order for the payment of the amount claimed, £16 7s. 6d., allowing complainant 20 guineas costs.

Our Plate.

House at Harrow for John Harvey, Esq.

This house is to be treated externally in white rough-cast and red brick, with red sand-faced tiles on roof. The external woodwork is painted white. In plan, the house is simple. It has a square hall with a fireplace. The dining-room is treated with oak beams in the ceiling. There is convenient access from the dining-room to the kitchen. The drawing-room, with French window leading to the garden, has a modelled plaster ceiling. On the first floor there are three bedrooms, servant's bedroom, box-room, linen cupboard, and bathroom, lavatory, etc. The architect is Mr. R. F. Johnston, of Chiswick.

With reference to the construction of the proposed new road to Dartford, the clerk to the Erith Urban Council reported to that body at a recent meeting that the Local Government Board had declined to sanction the proposal of the Dartford Board of Guardians, that the work be carried out by the unemployed of the district. Mr. A. Button thought that the Council should protest against the action of the Local Government Board. Mr. Kibblewhite (vice-chairman) expressed himself in agreement with Mr. Button. A resolution was passed that the Council receive with regret the intimation that the Local Government Board had not seen its way to grant the request of the Dartford Board of Guardians.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Dec. 11.	MINEHEAD. SHELTER, with cloakroom and lavatories, on the Beach, the whole expense of which is not to exceed £3,000. Premium of £20. Plan of site and conditions from L. C. Webber-Incledon, Clerk to U.D. Council, 16, Park Street, Minehead, Somerset.
Dec. 18.	TRAINING COLLEGE FOR TEACHERS, Kirkstall Grange, Far Headingly, Leeds. Architects practising in Leeds are invited to submit competitive designs for the above College. Sir Aston Webb, C.B., R.A., F.R.I.B.A., has been appointed Assessor. Copies of the conditions of competition and instructions, a plan of each floor of the educational blocks and of the hostel blocks, also an estate plan, showing a suggestion for grouping the various buildings, may be obtained from James Graham, Secretary for Education, Education Department, Leeds. Designs to be delivered not later than 12 o'clock noon. Deposit: £2 2s.
Dec. 31.	SOUTHEND-ON-SEA. NEW COUNCIL SCHOOL. Limited to Architects practising in the Borough. Conditions of competition and plan of site on application to J. W. Barrow, Clerk to the Education Committee, Education Offices, Municipal Buildings, Southend-on-Sea.
1910. Jan. 1.	LARNE. TECHNICAL SCHOOL IN VICTORIA STREET. For the Larne Technical Instruction Committee. Total cost, including fixtures and enclosing of ground, not to exceed £3,600, Premium, £21, merged. Successful competitor will receive commission of 5 per cent. for supervision, including plans, specifications, estimates, and *Bills of Quantities*. Particulars of Thomas Clearkkin, Secretary, Technical In-Instruction Committee, Larne.
1910. Jan. 31.	NATIONAL MUSEUM OF WALES. The Council desires to receive competitive designs for the erection of a new National Museum at Cardiff, Three premiums are offered of £200, £150, and £100, for second, third, and fourth. The Council have appointed Sir Aston Webb, R.A., Mr. John J. Burnet A.R.S.A., and Mr. Edwin T. Hall, F.R.I.B.A., as Assessors. Particulars and plans of the site will be supplied to competitors on payment of a fee of £2 2s., returnable if all papers are returned within 14 days. Inquiries to be addressed to Dr. Wm. Evans, Hoyle, Director of the Museums, City Hall, Cardiff.
Feb. 1.	OLDHAM, EXTENSION OF THE TOWN HALL. Restricted to Architects practising or residing in the Borough. Premiums of £50, £30 and £20, for the three designs placed 1st, 2nd and 3rd, and a sum of £5 will be paid to all unsuccessful competitors who send in a complete set of plans in accordance with the instructions. Plan of site, with instructions and suggestions for architects obtainable from E. C. Foote, Borough Surveyor, Town Hall, Oldham. Deposit: 21s.
Mar. 1.	GLAZED BRICKWORK DESIGNS AND ESSAYS. A committee of glazed brick manufacturers invite designs for works to be executed in glazed brickwork, also essays as to the advantages to be derived from the use of this material in accordance with conditions to be obtained from J. Johnston Green, 142, Liverpool Road South, Southport. Premiums of 100 guineas, 50 guineas and 25 guineas awarded to designs and essays jointly. Assessor Mr. Max Clarke, F.R.I.B.A., appointed by the President, R.I.B.A.
No Date.	CRADLEY HEATH. The trustees of the United Methodist Church invite Architects to submit designs on approval for Sunday School with seating accommodation for about 1,000. For particulars, Mr. C. Clee, Cradley Heath, Staffs.

Barnsley secondary school, which has just been opened, and is believed to have cost, in all, £25,200, accommodates about 400 girls, and about 60 younger children in the kindergarten department. Messrs. Buckland and Farmer, of Birmingham, are the architects.

Coming Events.

Wednesday, December 8.

INSTITUTION OF CIVIL ENGINEERS.—Visit of Students to Messrs. Barclay, Perkins and Co.'s Brewery, Park Street, Southwark.

Thursday, December 9.

THE SOCIETY OF ARCHITECTS.—Mr. Raymond Unwin on "Town Planning," at 8 p.m.

Friday, December 10.

ARCHITECTURAL ASSOCIATION.—Mr. F. C. Eden, on "Varallo, Orta, and Varese," 7.30 p.m.

Saturday, December 11.

NORTH OF ENGLAND INSTITUTE OF MINING AND MECHANICAL ENGINEERS.—General meeting in the Wood Memorial Hall, Newcastle, 2 p.m.

INSTITUTION OF MUNICIPAL ENGINEERS.—General meeting at Caxton Hall, Westminster, 11 a.m. Dinner, Gaiety Restaurant, Strand 7 p.m.

Monday, December 13.

R.I.B.A.—Professor A. D. F. Hamlin, on "Architectural Education in America," 8 p.m.

Tuesday, December 14.

NATIONAL FEDERATION OF BUILDING TRADE EMPLOYERS.—Meeting of Administrative and Journal Committees.

ANCIENT ARCHITECTURE LECTURES AT THE BRITISH MUSEUM.—Mr. Banister Fletcher's 11th paper, "Origin and Evolution of the Corinthian Order," 4.30 p.m.

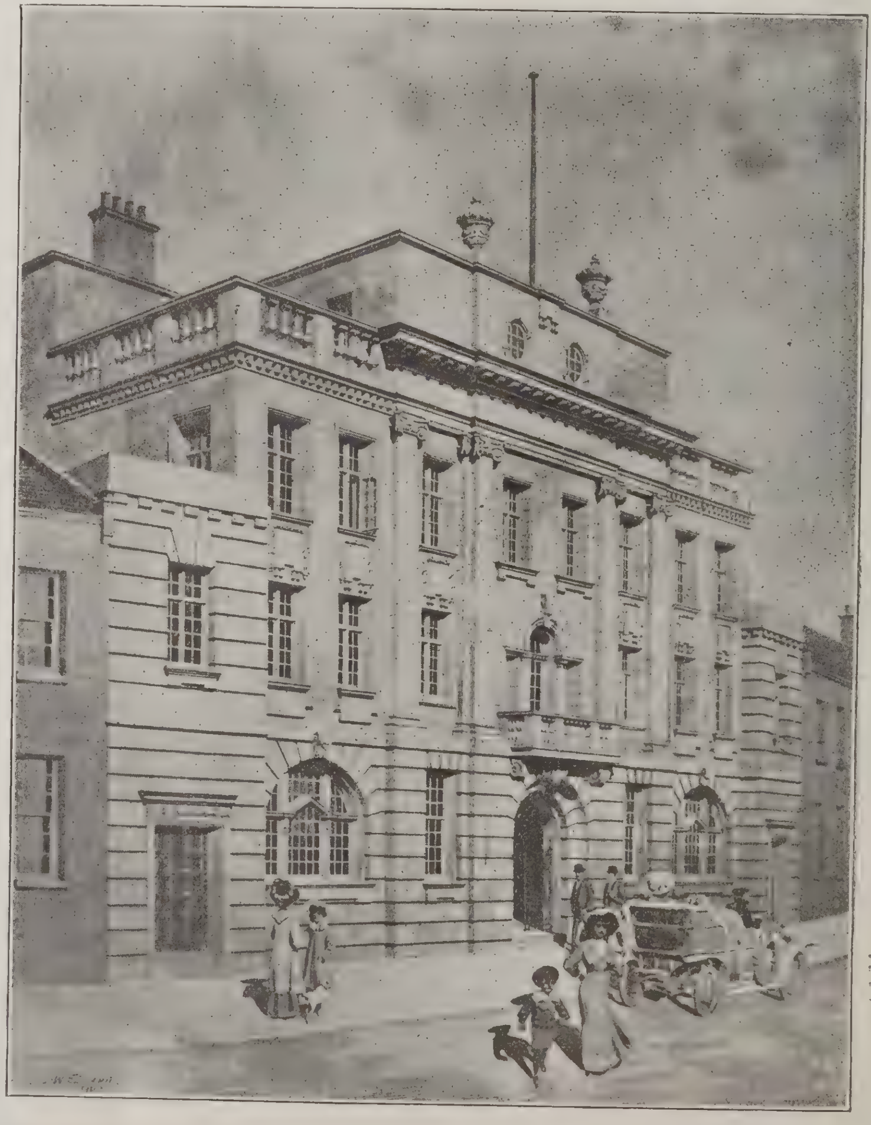
INSTITUTE OF SANITARY ENGINEERS.—Students' Meeting. Mr. Geo. W. Chilvers, M.R.San.I., on "Practical Heating and Hot Water Supply to Buildings," 7 p.m.

Tuesday, December 14.

THE TRADES TRAINING SCHOOL, of 153, Great Titchfield Street, W. Presentation of prizes at the Carpenters' Hall, London Wall, by the Duke of Argyll, K.T., etc. 8 p.m.

BUILDING ACTIVITY IN LEEDS.

Although very few people require the erection of shops or houses in Leeds at the present time, the local building trade has not come entirely to a standstill, and some notable improvements in the streets devoted to commercial, insurance, and banking concerns are in progress, while others are in contemplation. For several weeks "breakers" have been at work on the Old Cloth Hall Hotel and the adjoining aged buildings in Infirmary Street, opposite the northern side of the General Post Office. The erection of a modern building on this site will complete the transformation of the street, which began with the demolition of the big Cloth Hall and the subsequent erection of the Post Office. One or two fine blocks, a writer in the "Yorkshire Daily Observer" remarks, have been put up during the last decade, and when completed the street will be worthy of its near neighbour, Park Row. The latter thoroughfare will be much improved when the new buildings of the Union of London and Smiths Bank, Limited, are completed. These adjoin the recently finished Scottish Union buildings and the two firms very wisely agreed to adopt the same designs and material, so as to avoid the incongruity which spoils the effect of so many contiguous buildings in Leeds. In East Parade, the shops and offices which have been acquired by the Pearl Insurance Company are gradually being emptied, and the work of demolition to make



THE PRUDENTIAL BUILDINGS, ABERDEEN. PAUL WATERHOUSE, M.A., F.R.I.B.A., ARCHITEC room for the fine new offices that are projected is expected to begin shortly. The vacant site in City Square is once more to be adorned or disfigured—according to one's artistic temperament—by a hoarding, but when the proposed powers have been obtained by the Corporation to acquire the adjoining Northern Hotel, and thus double the site, it is to be hoped that the ground will be put to a worthier use. With this site containing a beautiful building, and a new Midland station in harmony, City Square would indeed be a source of justifiable pride to Leeds people.

CEMENT BRICK.

Although cement brick (or concrete brick) construction is still in its experimental stage, enough is known to demonstrate that under favourable conditions it may be a strong competitor of clay brick in both price and appearance.

The extensive use of cement brick by the Plymouth Cordage Co., Plymouth, Mass., has demonstrated several valuable facts. For the construction of their new mill having an aggregate wall length of nearly one-fifth of a mile, almost two and one-half million cement bricks were made upon the ground.

The mixture used in major part of the work was 3 parts sand to 1 part cement. A few bricks were made of 4 parts sand to 1 cement, for lightly loaded walls. The brick used on the outside of the building had a facing (⅛in. thick after compression) of 2 parts fine sand and 1 part cement, with the addition of 2 per cent. waterproofing (by weight) to the cement. Enough water was used to make a mortar of such consistency that it would hold its shape under compression, without flushing water to the surface so as to cause the mortar to stick to the plates. No definite percentage can be given as to the amount of water, as that is governed largely by temperature and atmospheric conditions, but the average amount was 8 per cent.

Care in curing the brick (that is, constant wetting), will overcome to a large degree any minor weakness which is theoretically developed by a "dry mix."

To the uninitiated, the small quantity of water used would seem likely to produce a porous brick having a strong attraction for water, with damp buildings as the result of their use. As a matter of fact, these bricks do not absorb water to any great extent. Bricks 30 days old, carefully dried and then submerged in water for 16 hours, showed the results given in Table No. 1.

Table I.—Absorption of Cement Bricks.

Brick.	Weight. Dry lbs.	oz.	Saturated lbs.	oz.	Absorption oz.
Face	5	8½	5	10	1½
Common inside	5	8	5	11	3
Facing material*......	4	9½	5	10	½
Hard burned body clay brick	4	11	5	7	12

*Brick made entirely of the material used for facing the outside brick.

Table No. II. shows the results of tests made under the direction of the Ordnance Department of the U.S. Army at the Government Arsenal in Watertown, Mass. The figures are averages unless otherwise noted.

Table II.—Tests of Cement Bricks.

Test "A." Face brick; body, 3 parts sand to 1 part cement; facing, 2 parts fine sand to 1 part cement; 2 per cent. waterproofing compound added to cement by weight. Facing ⅛in. thick after compression.

Age, days.	1st crack. lbs.	Ultimate strength. lbs.	Per sq. in. lbs.
56	87,100	87,100	2,730
120	100,900	108,650	3,400
239	128,500	132,650	4,145

Test "B." Common brick; 3 parts sand to 1 part cement.

Age, days.	1st crack, lbs.	Ultimate strength. lbs.	Per sq. in. lbs.
56	69,750	71,200	2,215
92	95,000	99,100	3,080
120	119,700	119,700	3,735
239	129,000	134,100	4,095
275	162,100	164,600	5,160

Test "C." Common brick; 4 parts sand to 1 part cement.

Age, days.	1st crack, lbs.	Ultimate strength, lbs.	Per sq. in. lbs.
56	74,150	76,500	2,390
120	89,050	91,450	2,810
239	119,500	126,400	3,905

Test "D." Common brick; 5 parts sand to 1 part cement.

Age, days.	1st crack, lbs.	Ultimate strength, lbs.	Per sq. in. lbs.
56	72,150	72,150	2,240
120	80,700	86,650	2,675
239	110,000	119,950	3,710

Test "E." Two hard-burned "body" clay bricks.

Age, days.	1st crack, lbs.	Ultimate strength, lbs.	Per sq. in. lbs.
...	101,000	150,000	4,770
...	94,000	162,000	5,470

In the tests, some peculiar phenomena were noticed. The best test on a 3 to 1 brick shows 5,400lbs. per square inch. The best on a hard burned "body" clay brick showed 5,470 lbs. per square inch. The average on the clay brick was 5,120lbs., or slightly less than that for the average cement brick at nine months.

Two bricks made at the same time, from the same stock, show varying results; for instance, two bricks (3 to 1) 275 days old; first crack at 155,200lbs. and ultimate strength 155,200lbs.; first crack at 169,000lbs. and ultimate strength 174,000lbs. Compare that with the clay bricks; first crack at 94,000lbs., and ultimate strength 162,000lbs.; first crack at 101,000lbs., and ultimate strength 150,000lbs. Average results show the first crack to be at 97.4 per cent. of the ultimate strength for 3 to 1 cement brick, 96 per cent. for 4 to 1 brick, and 94.3 per cent. for 5 to 1 cement brick; and 62.5 per cent. for clay brick. The lowest percentage shown in any cement brick was 87.5 per cent.

Six kinds of cement brick were made and used: (1) common brick, output 13,500 to 14,000 per day; (2) face brick, 9,400 to 9.800 per day; (3) 2in. radius brick for inside jambs, 8,400 to 8,800 per day; (4) outside corner brick (face and one end waterproofed), 8,000 to 8,400 per day; (5) headers, with one end faced, for arches and header courses, 9,000 to 9.400 per day; (6) white brick (faced with white cement for interior of the engine room), output the same as for the face brick.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.

***The** Editor is willing to answer enquiries from readers who require information on architectural, constructional, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies, or negligences which may occur.*

***Enquirers** whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.*

***Answers** by post will be sent if the enquiry is accompanied by a postal order for 1s. made payable to Technical Journals, Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.*

***This** fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.*

***The** Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable: and it must be understood that both question and reply will, as a rule, be published in these columns*

Fixing Casement Stay.

SHREWSBURY.—"SHREWSBURY" writes: "On the weathered exterior of a stone sill, the casement stay is secured with an eye screwed into a composition, filling a slot in the stonework. The composition, which is of a reddish-brown colour, requires renewing. Where is it obtainable, and how is it applied?"

The composition may have been red lead, at any rate that is the only substance that occurs to the writer as answering the description. The best way to renew the fastening would probably be to pick out the composition and run the screw in with molten lead.

HENRY ADAMS.

Domestic Hot Water Arrangements.

ASHTON-ON-MERSEY.—F. J. A. writes: "I have recently been troubled with the hot-water circulation at my house. Every time hot water was drawn in bathroom, when it was turned off at all quickly, the exhaust pipe over the cistern started running, causing the cistern to overflow at the tell-tale. Please advise as to remedy. A diagram is enclosed [not reproduced]."

The cause of the overflow is the lack of space or length of pipe in which the momentum of the flowing water can spend itself when the tap is quickly closed. Closing the tap slowly will slightly improve matters; but the best way is to fix a coil of pipe, say, 8ft. long, to the expansion pipe at a level above that of the water in the cistern when full, and attach the ∩ bend to this in the usual way. The coil may be helix, volute, or spiral, but should not be less than 6ft. long. When you disconnect the pipes, you will see that the water in the expansion pipe keeps to the same level as that in the cistern. Another way is to put a large bulb, big enough to get your fist inside, and a foot long, on the expansion pipe above the level of the water in the cistern, and make the ∩ bend of 1¼in. bore; make the ∩ as high as possible. It is the momentum of the flowing water that is the cause of your trouble. The static pressure at the bath tap is due to the difference between the level of the water in the cistern and the level of that in the tap; in your case say 5ft.; and the free flow due to this height should be 18ft. a second, but friction and bends will reduce it to perhaps 5ft. The momentum is the product of mass and velocity, or in homely though not quite so correct words, weight and speed, pounds × feet per second. There is 50ft. of ¾-in. pipe each between cistern and cylinder and cylinder and bath, and all the water in this is moving 19lbs., a considerable weight. If the speed be only 4ft. a second (which will surprise you when you see it run out of a plumb glass tube), the distance between the top of the water in the cistern (which is that in the expansion pipe) and the top of the ∩, perhaps 10in., is too little for the momentum of water in 100ft. of pipe. Your suggestion for a complete circulation is good, but you must remember that when a tap is opened, water flows to it from all directions, as a rule. Momentum has to do with it, and friction and bends also. If the area of the pipe from the junction of cold water and return hot-water be greater than that of the two pipes, you should have success. In any case, the two pipes should meet like a V towards the one pipe. The job requires a brass casting like an injector, though lead pipe can be worked to the shape. If the hot reservoir be higher than the tap, there is always a static pressure to force out the hot water, and if the tap be above the junction of cold with the returning hot, there is static pressure of hot against cold also at the junction; but I do not think you will get satisfaction unless the single pipe be equal in area to the two combined. Your best plan is to remove the 20-gallon cylinder to the bath-room, disconnect kitchen sink from present hot flow, and get a new 5 or 10 gallon cylinder for the kitchen. The present hot pipe from bath to cylinder can be used to connect to new kitchen cylinder, whose bottom should be on a line with the boiler top. This new cylinder needs 3 branches at the bottom, one for cold supply, two for boiler flow and return, and one half-way up the side for hot return from scullery. Fix the old cylinder either plumb or level as space allows in the bath-room, and connect it to the bath and bowl taps. Let these be as direct on to the main pipe as can be, so that hot water can be drawn at once. Fit the expansion coil, 2ft. long, at a higher level than cold cistern. Connect cylinder by new pipe to kitchen sink and to scullery sink, and then to the new kitchen cylinder. A complete hot-water circuit is thus made, hot water can be drawn more quickly, two taps opened at once will both flow full bore, and the momentum caused by opening a tap is spent in quickening the circulation. Not less than 30 gallons is a proper hot-water reservoir for a £30 house in either Palatinate. The ratio of cold reservoir to hot reservoir does not affect the working of the hot-water supply. The cold one should hold as much water as the household needs during the periods when the main is shut off. The ratio of hot reservoir to boiler may be 12 to 1. The ratios of cubic content of fire to those of boiler and of cylinder, make the complete set to ascertain. INGENIOR.

Sewage Works for Small Town.

CREDITON.—"URBAN COUNCILLOR" writes: "Kindly express an opinion as to the possibility of successfully employing a triple settling tank for the partial treatment of the sewage of a not very opulent Devonshire town. The amount of sewage is estimated at 40,000 gals. per diem. For many years the sewage has flowed in an open brook for about a mile direct to a river, and during six months of the year the adjacent landowners are utilising the sewage for irrigating the meadows, and for the remainder of the year the course of the sewage is confined to the aforesaid brook, and in a certain low place where the flow is sluggish, the smell has given annoyance to the owner of an important country house adjacent. It is not possible to increase the fall at this point, and the urban council are desirous of doing what they can to minimise the nuisance. Of course they wish to overcome the difficulty as economically as possible, and it has been suggested that a settling tank of the character described would effectually break up most of the solid matter, and the effluent would be fairly inoffensive. It is further suggested that, as all storm water finds its way into the town sewers, a by-pass with weir and screen should be constructed, so that in times of flood only the usual quantity of sewage should enter the tanks, and the flood tide should join the effluent at the present course in the brook. It is considered that the rush of storm water through the brook would scour it sufficiently to prevent any nuisance. If you will kindly criticise these remarks and help with any suggestions, I shall be grateful."

—The triple settling tank shown in the sketch [not reproduced] is apparently intended to act as a septic tank, but considerable alteration is necessary in the design. The partition walls should be built to water level only, where they would act as weirs, and scumboards should be placed on each side of them about 2ins. away, so as to cause the sewage to enter and leave each division of the tank at a depth of about 18ins. Scumboards should also be similarly placed about 12ins. in front of the main inlet wall and 2ins. from the main outlet wall. The water level should be at least 12ins. below the incoming sewer. A tank constructed in this way would break up most of the solid matter, of which 25 per cent. would remain in the tank, and the remaining 75 per cent. be carried away in a finely divided state suspended in the effluent, which will be a dark coloured, evil-smelling liquid. The only advantage to be derived from the employment of such a tank by itself would be that it would prevent unbroken excreta being discharged into the stream, although it is only half the size, it should be if forming part of a complete purification scheme. Perhaps the nuisance could be minimised by conveying the sewage past the important country house in pipes laid along the bed of the brook. The rush of storm water along the brook would not be materially affected whether it first went through the tanks or through a bypass adjoining them. Storm water scours out the sewers, and washes off foul matter from the surface of the roads, and is practically as objectionable in character as the sewage itself. The Local Government Board would not sanction the raising of a loan to pay for the proposed work, owing to its incompleteness, so that the whole cost would have to be borne by the rates in one year. If the whole of the population of 4,000 drains through this sewer, the daily flow is probably underestimated at 40,000 gals. per day. It would be far more satisfactory, and cheaper in the end, to construct a complete and properly designed scheme. It is impracticable to give details here of a complete scheme, which could be guaranteed to prove satisfactory, as so much depends upon a full and proper appreciation of the particular local conditions, and the skill displayed in the methods adopted to meet them, it being found that a system may give good results in one place and be a comparative failure in another. Generally speaking, it should consist of a screen, detritus tank, storm-water-diverting chamber, sewage tank, stand-by tank for storm water, and aerating beds. Certain broad recommendations are laid down in the fifth report of the Royal Commission on sewage Disposal.

HENRY ADAMS.

Building Infested with Earwigs.

BERWICK.—J. S. C. writes: "I should be much obliged if you could give me information as to how to destroy or prevent the accumulation of earwigs in a building. The building which they infest is a small hotel, built on a stiff glacial clay, which I don't think had been turned over for some time before the building was erected, and it stands quite free from trees or shrubs of any kind. All the usual means of killing the insects have been tried, but still they are there in thousands."

—The most successful method that I have ever known to be employed for mitigating this pest is to hang up pieces of hollow bamboo, or something of that character, in order that the insects may crawl into them—as is their natural habit—then every morning the canes are shaken into buckets of boiling water, and many thousands are thus very quickly destroyed. Dry artichoke canes were used in a case of which I have knowledge, and the result was excellent. F.S.I.

Question of Dilapidations.

WALES.—ARCHITECT writes: "Window frames, sashes, and door frames are decayed. Who is liable for their repair or replacement under the usual terms of a repairing lease?"

—Window frames, sashes, and door frames form a necessary portion of the external fabric of the building, and under the terms of your lease their repair will fall upon the lessor. I much doubt, however, whether he is in any degree liable for any replacement, even if they are thoroughly worn out, because, in the absence of a special covenant to the contrary, a landlord may allow his property to fall down and still be legally justified in demanding his rent. There is no law to compel any owner to repair his premises (except in the case of working-class houses). The internal painting and repair of the windows, etc., etc., of course fall upon the lessee. "Applied Mechanics."

The number of books on the subject of applied mechanics is very considerable, and therefore we think it incumbent upon any author who issues a new book on this subject to see that it contains a good deal more than earlier works, and treats the subject much more clearly and thoroughly. There is much that is useful and commendable in Professor Hancock's book, but it does not completely capture us. The book will be found useful by junior engineering students. No doubt it provides a good course of training, but it does not say much that is new, and, in our opinion, it is not framed upon such good lines as some other books which have been written more for the practical engineer. It is desirable for books on engineering subjects to be so arranged and written as to be easy of consultation by the engineer in practice. Such books are quite suitable for the student, and, indeed, better, because, if the student becomes well acquainted with a book, he will use it afterwards in practice. To consult this work for guidance on any point that may arise is not very easy nor speedy, and the work inclines rather too much to the theoretical aspect. It is very important that books for engineering students should be written with an eye to practice. Theoretical training is all very well, but it often obscures the straight issue. The writers of textbooks should have had considerable practice, and their books should be so compiled as to serve as constant aid-books in practical work afterwards, as well as sure guides to practical as well as theoretical training in the student. Perhaps, however, the chief value of this work will be in the suggestions that it offers to others who may follow, for no doubt much of the matter in it would be commendable if it could be embodied in a form more ready of assimilation by the engineer in practice.

"Applied Mechanics for Engineers." By E. L. Hancock, Assistant Professor of Applied Mechanics, Purdue University. New York: The Macmillan Company. Price 8s. 6d. net.

Mechanics of Materials.

This book, by C. E. Houghton, is obviously a work for elementary students, and we do not quite see its particular advantage over other works on the subject. It provides very little that is new. It might be useful as a class-book, but it is only an introduction to the subject, and that can be obtained from many other books which, at the same time, deal with more advanced problems. We are not much in favour of separate textbooks on the elementary aspects of engineering subjects. We are inclined to the opinion that it is better for a student to have a large and thoroughly serviceable book which will stand him in good stead, not only throughout his college course, but afterwards in practice. Mr. Houghton's book might very well be used, however, in conjunction with other published books, that are somewhat deficient in respect to elementary information. It is very clearly written, and is very commendable so far as it goes.

"The Elements of Mechanics of Materials." By C. E. Houghton, A.B., M.M.E. London: Archibald Constable and Co. Price 7s. 6d. net.

The Design of Arches.

The theory of the design of arches has made considerable progress in recent years, and this is due to the better understanding of the elastic theory, and may be attributed in great part to the publication of excellent and simple treatises by Prof. Howe and other American authors. The determination of stresses in arches is not easy, and in arched bridges of stone or brick the stresses are almost indeterminate. The modern elastic theory is no doubt correct when applied to solid steel ribs having a depth which is comparatively small when compared with the radius of curvature, and when the loading is applied at isolated points through vertical posts which are unbraced in the plane of the rib; in fact, the modulus of elasticity of steel is fairly constant, and the material is capable of resisting pretty equally both tension and compression, which facts render the determination of the stresses easier and more correct. For steel arched ribs, therefore, this theory is about as correct as the ordinary theory for steel beams.

Stresses in Natural Stone.

When, however, we begin to apply the theory to natural stone we find some difficulties. The material is not reliable in tension. This is particularly true of the joints between voussoirs. Furthermore, the modulus of elasticity in direct compression is variable, and not definitely variable, though within certain limits it may be considered without serious error as being constant. It seems to be accepted, therefore, that the elastic theory may be applied so long as the equilibrium polygon lies within the middle third of the arch ring, that is to say, so long as every section or joint is subjected to compressive stresses. The theory is also applicable when the equilibrium polygon lies within the arch ring, provided the compression is not sufficient to crush the material. Though we should suppose a masonry arch would fail when the equilibrium polygon passed without the ring at any joint, yet in practice we find that this does not always happen, the reasons being found in various causes, the chief of which is that the spandrels of masonry arches are usually filled in so that the arch ring is not allowed to open because of the clamping of the ring between the solid spandrel walls and a mass of backing of varying thickness. The spandrel filling, indeed, prevents a change in the shape of the rib to any great extent. Another reason is that in bridges having a considerable depth of side wall above the crown, a large portion, if not all, of the ring under these walls might be removed in many cases without complete failure, the wall forming an arch in itself. For such a variable material as masonry, however, we ought to employ a larger factor of safety, and it is customary with stone bridges to adopt a factor of ten.

Concrete Arched Ribs.

In plain concrete arched ribs the material is as variable in its modulus of elasticity as stone; in concrete arches, however, we have no joints to consider, nor do we have masonry spandrel backing, though we generally have present monolithic spandrel side-walls, and often spandrel tables which clamp the rib. Concrete cannot be depended upon to resist tensile stresses, and it is usual with plain concrete to provide for a factor of safety of ten upon the compressive strength. Numerous concrete arch bridges have been built with three hinges, and this arrangement has proved to be thoroughly satisfactory in practice, and in some cases the pressure curve has passed outside the arch without failure resulting, the spandrel walls acting as before mentioned in the case of stone arches, namely, preventing the arch ring being distorted sufficiently to cause failure.

Reinforced Concrete Arches

Reinforced concrete is, however, a very much superior material to plain concrete; it is much more reliable. Instead, therefore, of there being the desirability of employing a large factor of safety, we can reduce this to about four or five. The modulus of elasticity of reinforced concrete is pretty uniform, the only difficulty we have in reinforced concrete arch design is the determination of the position of the neutral axis. In reinforced concrete arches, the design is often complicated by the varying moment of inertia. The manner in which this is dealt with is now fairly well known, and can be studied from several text books.

The Neutral Axis.

The location of the neutral axis of a reinforced concrete section no doubt shifts under the action of different loads. In the elastic theory it is assumed that the arch axis passes through the neutral axis of each section of the rib, so that we assume the axis to lie at the centre of curvature of the section, and we treat the material by the common theory of flexure. In a reinforced concrete rib there is no absolute reason why we should never subject the arch ring to tension, but it seems to be the usual practice with designers to avoid this, and keep the pressure curve within the arch.

The Pressure Curve.

The pressure curve, or, as it is often called, the linear arch, is comparatively easy of determination with a plain concrete or masonry arch. The equilibrium polygon, which constitutes the pressure curve, is easily drawn. It is obtained by plotting a load line and choosing a pole and drawing vectors thereto, then on an elevational diagram drawing lines parallel with the vector lines from and to their points of junction with the load lines extended. A trial equilibrium polygon will perhaps not have the correct base line. We then require to chose a new pole, so that we can make the polygon pass through given points. If we make it pass through two given points, we fix the base line, but we do not determine the vertical height of the equilibrium polygon above the base line or springing line. When we fix three points, however (namely, the two springings and the centre), we can exactly determine the curve of the equilibrium polygon; and in plain concrete arches, and in some stone arches, the customary practice is to adopt three pivots or hinges so as thus to fix definitely the position of the equilibrium polygon or pressure curve within the arch. In steel work and reinforced concrete, and in some cases of plain concrete arches, we, however, often meet with a different condition: the arch may not have hinges, while at the same time it may, perhaps, be fixed at the springings. In that case we meet with some slight difficulty, for in order to obtain a starting point for the construction of our linear arch, it is necessary to know the amount, direction, and point of application of one joint pressure, and we may not know completely the one joint pressure—indeed, there may be no joint.

The Equilibrium Polygon.

The linear arch, as a term, may be defined as that particular equilibrium polygon which coincides to the pressure line, and the problem is to determine the equilibrium polygon, so that it shall coincide with the pressure line. Considering that in order to determine exactly the equilibrium polygon we must have three conditions specified, such as, for instance, three points through which the polygon must pass, the theory of arches has been a subject of controversy. The theory, however, which has received general acceptance is that of the principle of least resistance, introduced in 1837, by Moseley, an English engineer, whose work was translated into German by Scheffler, through whom the theory was chiefly promulgated. We may explain this theory by a simple example. Supposing we build an arch, as we generally do, upon a wooden centre, we will assume that when this latter is removed it is not removed suddenly, but is gradually lowered so that the arch becomes self-supporting by degrees. In this event the horizontal pressure or thrust at the crown gradually increases until the centre has been completely removed, when it has its least possible resistance. This hypothesis of the least crown thrust consistent with stability is Moseley's principle of least resistance. In constructing an equilibrium polygon, the horizontal base or pole distance is least, with the height of the polygon a maximum; therefore, in order to apply the principle of least resistance, the equilibrium polygon must pass through the highest point of the extrados of the crown and the lowest point of the intrados of the abutments. Such a distribution, however, would be incompatible with stability, and this early theory has given place to a more rigorous one from a mathematical point of view. We now regard it from the modern theory of elasticity, and we apply the principle of least work. The position of the linear arch is determined by Castigliano's theorem, which is that for stable equilibrium the work of deformation must be a minimum.

Winkler's Criterion. Though Hooke's law of elasticity is not strictly true for any material, it applies more or less to all, and we know that in deforming materials work is done, consequently we have to find the point at which the work of deformation is least. It is not necessary for us here to go into the complete mathematical discussion of the equation for the determination or the stability of an arch; it is sufficient for our purpose to refer to Winkler, who showed in 1879 that if for any given arch it were possible to draw an equilibrium polygon which should in every way lie within the middle third of the arch ring, then stability was assured. If we can design an arch so that we make the equilibrium polygon for the given system of loads the centre line of our arch, we secure the maximum efficiency, but we may be limited as to the curve of an arch, and therefore the equilibrium polygon will be different from that of the centre line of the arch. The usual method then is to draw various equilibrium polygons until one is found which keeps within the middle third of the arch, the thickness of the arch ring being altered, if necessary, so as to permit of this. In that way stability is assured. We often, however, see arch ribs employed in steel work—and they are now beginning to be employed in reinforced concrete, in which the construction is more in the nature of a curved beam, and the pressure curve does not lie within the arch. In short, the arched rib of metal and of reinforced concrete is capable of resisting bending moment, and it is this which forms the fundamental difference between the arched rib and an ordinary arch of plain concrete or stone. Arched ribs are usually constructed in three ways: (1) hinged at the abutments and at the crown; (2) hinged at the abutments and continuous throughout; (3) fixed at the abutments and continuous throughout.

The Three Methods. The method of drawing the equilibrium polygon differs for each of these three methods of support. In the first case, as the equilibrium polygon must pass through the three hinges it is completely determined. In the second case, a third condition is necessary to make the problem determinate. In addition to the vertical reaction we need to apply horizontal reactions, which we may call P_h. This will be the same as the pole distance of the force diagram. The calculation for determining P_h is as follows:—

$$P_n = \frac{\int \frac{M_p\, z}{E\, I}\, ds}{\int \frac{z^2}{E\, I}\, ds}$$

M_p = moment of forces on left of any point in the arch axis, Z = the perpendicular distance of P_h from the point in question, E = modulus of elasticity, I = moment of inertia, and dS = distance of two points apart.

E is usually constant throughout the rib, consequently we may ignore this, and the equation reduces to:—

$$P_h = \frac{\int \frac{M_h\, z}{I}\, ds}{\int \frac{Z^2}{I}\, ds}$$

It is usual to make $\frac{ds}{I}$ a constant by splitting the arch ring up into portions of different lengths. The loads may then be assumed to be applied at the centres of each section and vary in amount. This done, it is a simple matter to calculate the horizontal reaction or the pole distance, from which we can strike the vector diagram and draw the equilibrium polygon.

Fixed or Continuous Arch Rib. In a fixed arch or a continuous arched rib, we have a somewhat more difficult case, and reference can be made to the works on the subject of arch design for a detailed consideration and for methods of the solution of such problems. It may be finally added that it is possible to treat beams of irregular shape by analysing them as arches, and, indeed, to treat arches by analysing them as beams; and it may be found advisable in some cases to do this. Whichever way we work round, we should obtain the same results in our analysis. Which is the best procedure to adopt will depend upon the particular circumstances of each case. In general, it is not so easy to determine the stresses by means of the arch theory as by the beam theory, therefore, engineers endeavour as far as possibile to calculate peculiarly shaped beams as beams and not as arches, but we can often see more clearly the correct solution by considering the problem from the arch point of view. In that case, however, we are often compelled to consider various cases of loading, as, for instance, irregular or moving loads. We may find that some peculiar instances in which structures designed by one method have shown extraordinary resistance are explainable by a reference to the arch theory, and it is not quite clear always which method of calculation will give us the best result. We may be sure, however, that the structure, however it is built, will act in the most favourable manner, i.e., that the principle of least work will come into play. This explanation of the peculiar results sometimes obtained in practice shows us that it would be advisable often to look at the problem of design from different points of view, in respect to these structural elements, in short to consider the possibility of a beam acting as an arch and *vice versa*.

POINTS ABOUT SHEAR STRESSES.

There seems to be insufficient attention paid as a rule to the design of beams subject to shear stresses. We often find beam constructed which are very deficient in the number of shear stirrups, and there have been a few instances lately where building have developed considerable cracks due to these shear stresses, and have had to be strengthened and partly reconstructed.

Somewhat strange to find, American engineers sometimes state that shear reinforcements are not necessary in beams. Certainly, a few tests have appeared to sugges that beams without such diagonal reinforcements resist loads as well as those with them but there are many more tests to prove the contrary. Shear members are indeed extremely important. T beams particularly require treatment, and as the ribs of these T beams are often very narrow, not only have we to consider shear stresses within the leg of the T, but also at its point of connection with the slab, both horizontally and vertically. It is well to have plenty of shear members to fix the leg to the table, and also the rods in the slab should be run into the beam to give this security on the vertical planes of attachment, because otherwise the resistance of the table of the T cannot be developed, indeed, the width of the table which can be taken into account in calculating this moment of resistance of a T beam is dependent upon the shear resistance of the planes of connection both horizontally and vertically. If the leg is made very small, then the secondary reinforcement should be correspondingly increased.

The methods of treatment of such shear reinforcements have been discussed in many text-books. The shear reinforcements are provided in several ways, and the methods of calculations for the various kinds are somewhat different. For instance, in some systems the main tensile reinforcements are cranked up as the supports are approached where the bending moment is reduced, so that they can be removed from acting in direct tension. In these cranked main rods a great deal of the shear is picked up; indeed, one may say roughly, half of it is resisted by them because, as a rule, about half the main rods are bent up in this way.

Where shear members are rigidly attached to the main reinforcements, there is no reason to fear slipping, nor is there any particular reason to fear a bond failure due to deficiency in adhesion between concrete and steel.

There is another type of beam reinforcement, in which a number of small bars are used, and these are gradually turned up to provide the shear members. This is only an extension of the method first referred to, but the difference lies more particularly in the fact that the inclined reinforcements in the first method extend from almost ⅓ points of the span to the top of the beam directly over the supports, so that the angle which they make with the horizontal is roughly about 30 degrees, whereas in the second method the rein-

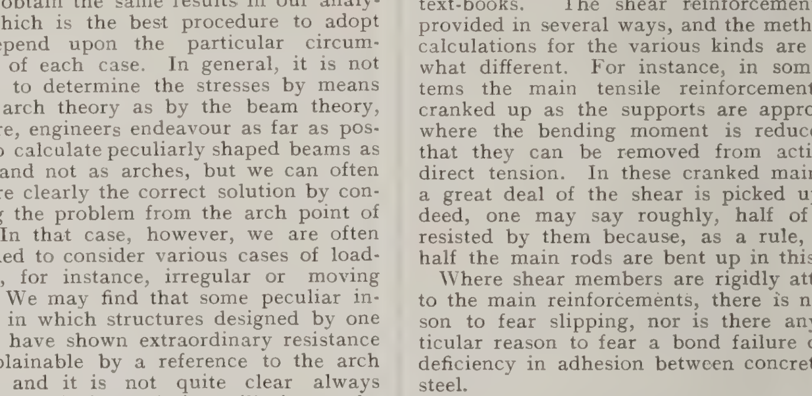

DIAGRAM ILLUSTRATING SHEAR STRESSES.

forcements are bent upwards at about 45 degrees, and do not extend to the supports.

In a third method the special bars have parts thereof sheared and turned up at 45 degrees.

In a fourth method, and, perhaps, the most general method, if not exactly the earliest, the shear members are separate from the main reinforcements, and are linked round or attached thereto. These reinforcements are in some cases placed at angles of 45 degrees, but more generally are placed vertically within the beams. There is some little contention between the advocates of the inclined and vertical stirrup as to which is the best position. As the concrete tends to crack on lines approaching 45 degrees, the most direct action is thought to be to cross these lines at right angles with stirrups, making another angle of 45 degrees with the main bars. Other advocates, however, claim that although this may be the most direct action, the vertical stirrups are more effective in a secondary action, which is that when the concrete is cracked, one part of the beam tends to drop down below the other, and this vertical deformation is prevented by the vertical stirrups suspending, as it were, the main bars back in position. It may, however, be argued that after all the vertical stirrups can be considered as filling the most natural and direct position, because vertical stirrups cross more planes of principal stresses and serve to curve these lines of principal stresses into the normal position, which is to make junctions at 45 degrees with the main reinforcements. The angle of 45 degrees is arrived at by consideration of the fact that the strength of concrete in tension is ignored in our calculations by general acceptance; this is not actually a fact, but if we neglect the tension in theory, our calculations must provide for neglecting it in shear, and the 45 degrees inclination then becomes the correct one.

Though a few persons seem inclined to argue that the vertical stirrup does not slip upon the bar if it is not rigidly attached thereto, the more general consensus of opinion is that in most beams there are points at which the vertical stirrups require rigid attachment to prevent them sliding, the argument being that as the change in the bending moment along the tensile reinforcement is distributed across the beam by means of the concrete, then the means whereby this distribution takes place must be the adhesion between the concrete and the steel, therefore, the rate of change of bending moment is a measure of the adhesion that requires development, and it will be found that most beams, at any rate, of any ordinary span and with any ordinary loading, will require a rigid attachment of shear members somewhere near the supports, as otherwise the adhesion stress will far exceed the limits which authorities suggest as conservative, and would cause a slipping to take place, in which case the shear members would become ineffective.

The subject of shear stresses is, however, an intricate one, and there is room for more detailed study in this connection. For instance, other points that require observance are that the stirrups shall have some mechanical hold in the concrete in order to develop their strength, as otherwise, being of such short length they would often have to pull through the concrete before they could develop the resistance of the section of metal that is given to them.

As regards the question of bond, or adhesion, stresses, these are complicated by questions of shear, and there are several schools of thought in this respect. One, for instance, claims that it is unwise to rely upon any adhesion, and it is advised in order to obtain a mechanical bond, to use one or other of the deformed bars on the market. Other patentees claim that there is no necessity, in many cases, to use such deformed bars, which cost an increased price beyond that of ordinary round or square bars, and contend that even if they are used it does not prevent the concrete shearing between the deformations because, it is argued, the shear resistance of the concrete is, in most regulations, put at less in amount than the adhesion between concrete and steel. Others again point out that if the shear members are rigidly attached to the main bars, not only is mechanical bond provided, but the matter of adhesion is not at all important, and is almost unnecessary, for the strength of beams reinforced with such rigid attachment shear members is fully developed, even if there is no concrete below the main bars, the shear members and the concrete filling serving to provide a kind of lattice girder or truss.

The fact is, of course, that a thoroughly efficient job can be provided with any and all of the different methods; the only question we have to consider is (1) as to whether the systems are properly applied with full knowledge, and (2) which is the most economical in any particular case. It may be, and, at any rate, at present can be almost safely said, that none of the systems is the best and will meet all cases. The best method is to employ a combination of systems, if we may so call it, and the designer should give himself plenty of latitude and not restrict himself to any hard and fast methods.

We append a few simple rules for the calculation of shear stresses in ordinary cases, these rules being those which meet with most usual acceptance:—

Using the standard notation of the Concrete Institute, in which

S = total shearing force across any section.
b = breadth or width of rectanguar beam or of rib of T beam.
d = effective height or depth.
kd = depth to neutral axis.
t = unit tensile stress in steel.
A_T = area of steel in tension.
A_S = area of steel in shear.

If S is the shearing force at any point of a beam, the maximum shearing resistance

$$\frac{S}{b\,d\left(1-\frac{k}{3}\right)}$$

If this exceeds 100lbs. per sq. in., the beam needs reinforcing against shear stresses.

When bars are cranked up, S is reduced by $t\,A_T \operatorname{Sin} \alpha$, where α is the angle of the bars to the horizontal. The maximum shearing resistance then becomes

$$\frac{S - t\,A_T \operatorname{Sin} \alpha}{b\,d\left(1-\frac{k}{3}\right)}$$

If shear members are employed they are usually calculated to resist the whole of the shear stresses. If inclined at an angle β to the horizontal

$$As = \frac{S}{t \operatorname{Sin} \beta}$$

or when some of the tensile rods are cranked up,

$$As = \frac{S - t\,A_T \operatorname{Sin} \alpha}{t. \operatorname{Sin} \beta}$$

When shear members are placed vertically the section of metal is usually kept uniform and the spacing varied. The spacing is determined by plotting the diagram of bending moments, dividing its maximum ordinate into equal parts, so that the distance from the supports to the first shear member does not exceed half the depth from centre of compression to centre of tension, and drawing through each of the points so found a line parallel to the closing line of the diagram; where these lines cut the curve, verticals are drawn and give the positions of the shear members. This method is shown in diagram. The section of the metal is then determined for the vertical nearest the support by finding the bending moment B at that point, considered in all cases as a freely supported beam. Then:—

$$As = \frac{B}{t\,d\left(1-\frac{k}{3}\right)}$$

There is also a shearing or slipping along the horizontal reinforcements to be considered. The shearing stress around the bars $= \frac{S}{O\,a\left(1-\frac{k}{3}\right)}$, where O = total perimeter of bars. If this shearing stress exceed 100lbs. per sq. in., the shear members should be rigidly attached to the longitudinal bars, which should also have their ends split or bent to lock into the concrete.

Views and Reviews.

The Calculus.

The Calculus is a subject which is always difficult to the beginner in mathematics. It is so very important to the student in engineering, however, that many books have been published, designed to give him a working acquaintance with the calculus in the shortest time and with the practical application of mathematical theory. The author of this book acknowledges his indebtedness to Professor Perry, whose book on this subject is well known. This book is very clearly written, and the examples are all of practical application, and to this end a large number of problems have been fully worked out. We can highly recommend this book to students of the subject.

"The Calculus and Its Application." By Robert Gordon Blain, M.E., Assoc.M.Inst.C.E. London: Archibald Constable and Co., 10, Orange Square, W.C. 4s. 6d. net.

A FACTORY IN REINFORCED CONCRETE.

In this issue we reproduce some of the working drawings, together with a photograph of a factory which has been constructed in reinforced concrete at Wealdstone, near Harrow, for the Kodak Company, Limited. The reinforcement throughout consists of Kahn bars supplied by the Trussed Concrete Steel Company, Ltd., of Caxton House, Westminster, who are responsible for the engineering design. The architect was Mr. Simon Victor Hause, works manager, Kodak, Ltd., and the contractors were Messrs. D. G. Somerville and Company. The building is an interesting example of a form of construction which is used considerably in the United States, but is not so well known in this country. It consists of a floor with a level ceiling formed of hollow terra-cotta blocks embedded between ribs or small beams of reinforced concrete, the filling over the blocks forming practically a slab and converting the ribs into T beams. The working drawings show various details of the construction, and well illustrate how the system is applied—in fact, the construction. A level ceiling is often needed, and is particularly desirable in a building of this character, where the ventilation must be good and no dust can be allowed to collect on or drop from the ceilings. These floors are fairly lightly loaded, but the system can be applied to the construction of floors required to sustain a much heavier load. The centering required for such a type of floor construction is not so heavy as for ordinary slabs and beams; the boards need only be placed under the soffit of the reinforced concrete ribs with the hollow blocks resting between, the steel first having been placed in position between the rows of blocks; the filling is then poured in position over all. The centering, therefore, on the whole, is readily and quickly erected, and easily removed.

Mr. A. W. Itter has given 50,000 bricks—carted free of cost—to the new King's College Hospital, now being erected at Denmark Hill.

NEW BUILDING, KODAK WORKS, WEALDSTONE: DETAILS.

THE PRUDENTIAL BUILDINGS, ABERDEEN.

(*See illustration on page 438.*)

It is a matter of common knowledge that the Prudential Assurance Company have a large and rapidly increasing clientele throughout the North of Scotland. To meet the increasing demands of their business, they have secured a site in Crown Street, Aberdeen, opposite the new General Post Office, erected three years ago.

Messrs. Sutherland and George, a well-known firm of architects, practising in Crown Street, a few doors away, have been appointed by the company to assist Mr. Waterhouse, of London, by acting as local superintendents of the work. The new offices will be within three minutes' walk of Union Street, and right in the heart of the Granite City. Hitherto a residential thoroughfare, the advent of the Post Office and now the Prudential Offices, and a new Masonic Temple is rapidly changing the appearance in a startling manner.

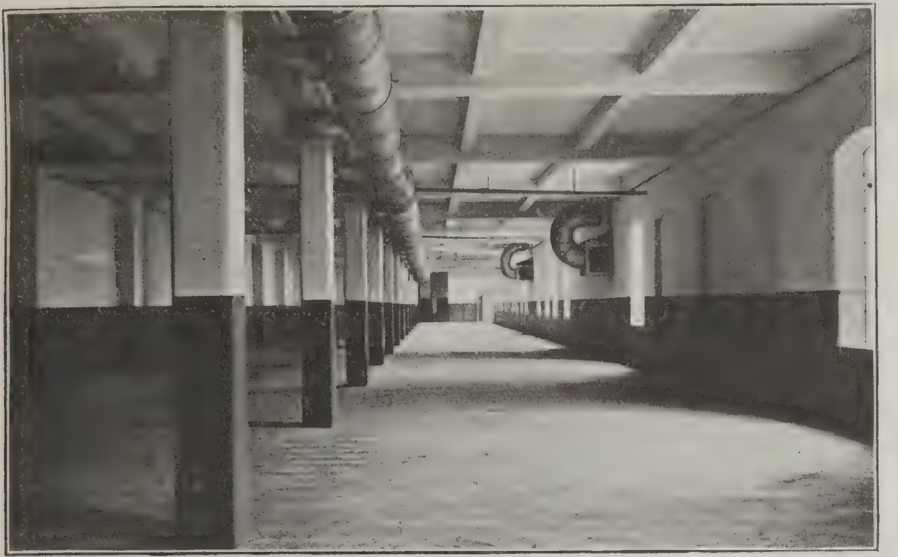
In the proposed new buildings, Mr. Paul Waterhouse, F.R.I.B.A., London, the architect, has realised not only the desirability of using granite in the Granite City—an intention in which the company entirely concur—but also the equally important necessity of treating granite as granite. It is for this reason that he has composed the design in simple lines, and has endeavoured to get the effect of dignity rather by proportion and mass than by intricacy and rich detail. Though a fine one, the site was not without its difficulties for the designer, foremost among which was its obliquity. It is to avoid the inconvenience of this obliquity, and also to obviate the incongruity sometimes produced by a high building rising abruptly among lower houses, that the designer has placed a wing of moderate height at each end of the composition. By this means he has got rid of the unsightly effect which would have resulted from a conspicuously acute angle at the north-west of the building, and has, moreover, reached the height desired in his central block without too sharp a contrast with the surrounding architecture.

A central archway leads both to the entrance of the company's own offices, and also to the staircase which give access to the upper floors. These upper floors are intended to be let as offices. The peculiar fall of the ground and the possession of a second frontage in Windmill Lane have made it possible to arrange an upper and a lower ground floor at the back of the building, containing sets of exceptionally well-lighted offices, so disposed as to be let either in large groups or small.

Another door leads to a large office, with windows on the front, so designed as to be suitable for occupation either by a branch bank or by a professional or business tenant of the class to whom a ground floor approach is of value. This tenancy would have self-contained basement accommodation, serviceable for strong rooms and similar purposes. In another part of the basement are placed smaller strong rooms for the use of the tenants occupying the upper floors. There will be eleven or twelve rooms on each of the principal floors.

The staircase will be warmed and well-lighted, and the hall or corridor by which the staircase is approached from the central archway will be faced by a large window, intended to give a cheerful character to the entrance.

The offices to be used by the company will be finished in a manner similar to that employed in their other more recent buildings. Screens, doors, counters, and furniture are to be made in mahogany and other hard woods—the walls receive a simple treatment, partly in semi-glazed faience and partly in coloured plaster, and the pavement will be mosaic. An effective and serviceable decoration is aimed at without undue elaboration.



NEW BUILDING, KODAK WORKS, WEALDSTONE. GENERAL VIEW OF THE INTERIOR.

OPENING OF BLACKFRIARS SUBWAYS.

The public subways at the north end of Blackfriars Bridge, which have been constructed at a cost of £30,000 to relieve the congestion of passenger traffic, were opened on Monday week by the Lord Mayor (Sir John Stuart Knill), who was accompanied by the Lady Mayoress and their daughter, and by Mr. Sheriff Roll and Mr. Sheriff Slazenger. There were also present Sir Melvill Beachcroft (chairman of the London County Council), Canon Horsley (Mayor of Southwark), the Rev. F. H. Hillersdon (Mayor of Westminster), the Rev. P. Clementi-Smith, and the Chairman (Mr. John Stopher) and members of the Streets Committee of the City Corporation. The Lord Mayor, on his arrival, was received by Mr. Stopher and conducted to a dais in the pavilion erected over one of the entrances to the subways, where he was welcomed on behalf of the Streets Committee. Mr. Stopher pointed out that the subways had originated in the widening of Blackfriars Bridge, and the scheme was due almost entirely to the efforts of one of his colleagues, Mr. Deputy Morton, M.P. When the Corporation promoted their Bill in Parliament for the purpose of widening the bridge, it was realised that in consequence of the width of the roadways, and the enormously increased number of people who would cross the bridge, the subways were of the highest importance. The London County Council also recognised that as they desired to bring their tramways across the river it was essential to relieve the congestion of the streets. They agreed to contribute out of the general rates of London a sum of £30,000 towards the cost of construction. The work began on December 18th last year, and the subways, now completed, had a total length of 480 yards, and were 10ft. wide and 8ft. high. The task had been carried out without any loss of life or injury to any person engaged on the works. The difficulties were complex and considerable. They involved the diversion of the pipe subway of the London County Council, and the removal of the electric light, gas, water, and other mains, and the re-arrangement of 140 telephone and telegraph cables containing 4,000 miles of wire The cost of construction alone had been £10,000, and the balance of £20,000 had been swallowed up in the sums paid to the General Post Office for the removal and readjustment of its apparatus.

Messrs. Perry and Co., the contractors, then delivered up the gold key of the subways to Mr. Basil Mott, the engineer, who in turn handed it to the Chairman and thence to the Lord Mayor. After unlocking the gates, the Lord Mayor made an inspection of the subways. Responding to a vote of thanks, Sir John Knill said that in his opinion the subways were a necessity at that particular point—a dangerous crossing which had become more so lately on account of the enormous motor traffic. He felt sure that the subway would be the means of saving many lives, and would be received with gratitude by the public.

The gold key with which the Lord Mayor opened the new subways is the work of Messrs. Garrard's, the Crown jewellers, of the Haymarket. It is richly chased and pierced, and bears the City Arms and supporters enamelled in colours, while on the reverse is engraved a suitable inscription.

The subway at Brackfriars Bridge, a writer in the "Morning Post" observes, may be regarded as an experiment in order to see how far an underground passage will save the time of the citizens, and safeguard them from the dangers incidental to the congested traffic. In the evidence given before the Royal Commission on London Traffic in 1903 it was stated that about 18,000 vehicles passed over Blackfriars Bridge in the twelve hours from 8 a.m. till 8 p.m., and about 22,500 crossed over the north end at the Thames Embankment. The traffic has considerably increased since then, and now that the bridge has been widened, pedestrians have not only to cross a larger space, but also to avoid the tramcars sweeping round from the bridge on to the Embankment. If a subway fulfils its purpose, it will largely solve the difficulty. Its main section is in the direct line of traffic, and runs from the point at which the bridge and the Embankment meet across to the junction of New Bridge Street and Queen Victoria Street. Half-way along it is cut by a smaller subway communicating on the east with Blackfriars Station and on the west with the Royal Hotel.

The subway at the bottom of Parliament Street, while affording communication between Bridge Street and Great George Street, was built primarily as a means of access to the public lavatories; the whole work cost about £6,000. The subways under the open space in front of the Mansion House are involved in the approaches to the Bank Station of the Central London Railway. Their total length is about 300 yards, and together with the booking hall, they were constructed at a cost of nearly £100,000, as the result of an arrangement between the railway company and the City Corporation. They are maintained by the company, and policed by the City, which has the right to close all entrances on special occasions, except those in front of the Royal Exchange. But it is still a moot point whether the subway has fulfilled its expectations, for of the 60,000 people who use it every day, 40,000 are passengers to or from the railway. One cause of the public's lack of appreciation, it has been suggested, is that the passages are complex, indirect, and bewildering, so that a pedestrian finds it impossible to go in a "bee-line" from (say) Walbrook to Threadneedle Street, or from Prince's Street to Lombard Street, and has to describe at least half a circle underground. It cannot be denied, however, that London, with its narrow streets and enormous traffic, has need of every help that subways can give to relieve the congestion, and to enable people to avoid dangers from motor vehicles. At Trafalgar Square, at Oxford Circus, Holborn Circus, Piccadilly Circus and at the point where Kingsway and Aldwych join a subway would be of immense service in enabling pedestrians to avoid the enormous traffic that sweeps rapidly over those areas. Time also would be saved, for it was proved by evidence given before the Traffic Commission that out of the twelve hours between eight in the morning and eight in the evening, not less than 5h. 5min. was lost by the traffic being blocked in Threadneedle Street, 5h. 1min. in Cornhill, 6h. 5min. in Prince's Street, 3h. 32min. in Wellington Street, and 4h. 6min. in the Strand. In St. James's Street, during the busy time, traffic is arrested for three-quarters of every hour. The holding-up of vehicles means the holding-up of pedestrians, but with the establishment of subways at busy centres, it might be possible for them to go their way undisturbed.

Notes and News.

At a recent meeting of the Incorporated Society for Promoting the Enlargement, Building, and Repairing of Churches and Chapels, it was stated that the Society had helped more than half the total number of parishes in England and Wales with building grants amounting to £1,068,110.

* * *

The postponed Conference on town planning procedure will be held on Tuesday and Wednesday, December 14 and 15, at the Westminster Palace Hotel. The National Housing and Town Planning Council, under the auspices of which the Conference is to be held, propose to place before it as the basis for discussion a series of suggestions as to the most practical lines of town planning procedure adapted to: (a) great centres of population; (b) urban districts. The following gentlemen have been asked to co-operate in the preparation of this series of suggestions: Professor S. D. Adshead, Professor of Town Planning, Liverpool University; Mr. John H. Barlow, Bournville Village Trust; Professor Berlepsch-Valendas, Munich; Mr. Albert E. Cave, London; Professor Eberstadt, Berlin; Professor Fuchs, Tübingen; Professor Patrick Geddes, Edinburgh; Ober-Baurat Geusen, Dusseldorf; Mr. E. M. Gibbs, F.R.I.B.A., Sheffield; Mr. T. C. Horsfall, Manchester; Mr. Percy B. Houfton, architect, Woodlands Colliery Village; Mr. T. H. Mawson, Windermere; Beigeordneter Rehorst, Cologne; Monsieur Augustin Rey, Paris; Mr. B. Seebohm Rowntree, Earswick Village Trust; Mr. Raymond Unwin, Hampstead Garden Suburb; Oberbür germeister Wagner, Ulm; and Mr. Percy Scott Worthington, F.R.I.B.A., Manchester. The suggestions will take the form of a skeleton plan setting forth the best course for a local authority to take in the administration of the new Act. They will be printed and placed before the representatives at the meeting. Before the close of the Conference, arrangements will be made for the formation of a Town Planning Advisory Committee, in accordance with the resolution of the Congress held in August last. The gentlemen named above are being asked to act as members of this Advisory Committee and to give it the benefit of their skilled advice.

It is announced that the Commissioners of Works will introduce a Bill into the next Session of Parliament authorising them to acquire by compulsory purchase, or otherwise, land and buildings adjacent to the west side of the National Gallery. The site is in the occupation of the Earl of Lonsdale. It is bounded on the north by St. Martin's Street, the barracks, and the Horse and Dolphin publichouse.

* * *

The Metropolitan Electric Supply Co., of 16, Stratford Place, W., have opened new showrooms at 15, Porchester Road, Bayswater, for demonstrating to the general public the use of electricity in their homes, not only for lighting but for cooking, ironing, floor cleaning, etc. The decorative scheme has been carried out under the direction of Mr. A. W. Neal (the inventor of the decorative material known as "Coatostone," various tints of which are here put to effective use), of 77, Mortimer Street, W.; the electric lighting by the company's expert.

* * *

The operation of depositing cement under water to form concrete foundations and similar work is always interesting, and this character of work is being done at the present time on a large scale in the construction of the Detroit River tunnel of the Michigan Central Railroad. In depositing the material "tremies" are made use of, operated from a barge carrying the concrete mixing plant. These are riveted steel tubes, slightly longer than the deepest part of the river, and discharge the concrete directly into the forms.

* * *

To exclude water while the first batch is being laid, two or three empty cement bags are stuffed into the top of the tube and the wet concrete is poured in, forcing the bags down and the water ahead of them, and by continually maintaining the tube full of concrete no river water can enter. After the concrete begins to emerge from the lower end, the tube is kept several inches under the surface of the mass, forming a seal. As the concrete builds up in the forms the tremie tubes are raised in the towers supporting them on the barge. A floater rises with the concrete and indicates through a wire to the operator on the scow when the tremie should be raised. The wet concrete distributes itself from the bottom of the tremie tube in a circle about 10 feet in diameter.

* * *

The Metropolitan Water Board, at its monthly meeting, had before it a proposal put forward by the General Purposes Committee for the acquisition of a site in Kingsway for the erection of central offices. At present the Board's headquarters are at Savoy Court, and the premises are not large enough to house the whole of the staff which should, under a proper system of organisation, be concentrated at the head office. There is no accommodation for the meetings of the Board, which are held at the offices of the Metropolitan Asylums Board by permission of that body. The recommendation was that £100,000 should be offered to the London County Council for the freehold of 24,930 square feet of land fronting Kingsway, Sardinia Street and Lincoln's Inn Fields. It appeared from the report of the Committee that the net rent of the present offices in Savoy Court is £4,210 per annum, and that if the Board provided new offices, it would be possible to close altogether the New River Office, and that at Southwark Bridge Road, and further economies might follow. It had been suggested that the Board's land in Rosebery Avenue should be utilised, but the Committee did not thing it sufficiently central. A scheme was also contemplated which would include the closing of the Board's works at that place, and the Committee was advised that better value could be obtained by the sale of the Board's land there if the most valuable portion were not retained for the Board's own purposes. With regard to the proposed site in Kingsway, it was calculated that the scheme would result in immediate economy and an ultimate revenue from the letting of offices of £3,350 per annum, and that the Board would be able to effect large improvements in organisation. After a long discussion, the recommendation was by 22 votes to 15 referred back to the committee with instructions to bring up a report as to the utilisation of the Rosebery Avenue site, or other sites. In the course of the debate Sir Melvill Beachcroft drew attention to the fact that the London County Council would in the near future be vacating the County Hall at Spring Gardens, and the Education Offices on the Embankment, either of which might be available.

THE NEW GENERAL POST OFFICE BUILDINGS.*

By Thomas A. Watson, Assoc.M.Inst.C.E.

The New General Post Office Buildings consist of two blocks, viz., the public office block, 210ft. long by 54ft. wide by 80ft. high, with four floors above the ground floor and two below; and the sorting office block, 312ft. long by 212ft. wide by 75ft. high, with three floors above the ground floor and two below. Between the two blocks is a loading yard, 200ft. long by 60ft. wide, under which the basement and lower ground floors extend.

Both blocks are constructed on the skeleton type, in which all superimposed loads, including external walls, whether of ferro-concrete or stone, are carried at the various floor levels on girders supported on columns. The external walls are constructed in brick and stone, and at the ground floor level vary from about 5ft. thick to 2ft. 6ins. Many are constructed in reinforced concrete, and average only 7ins. thick.

Notwithstanding the great difference in the above thicknesses of wall in favour of the employment of reinforced concrete, it is probable the latter will soon become obsolete, as should the London County Council in the regulations dealing with reinforced concrete structures, and presumably now in course of preparation, extend the same facilities to reinforced concrete skeleton buildings, as given in the New General Powers Act to steel structures (and there is no logical reason why they should not), it will be possible to build external 9-in. and 14-in. walls as panels between columns, and these are much more economical than reinforced concrete walls 7ins. thick. At present, however, the progress of reinforced concrete construction has been seriously handicapped by the passing of the Act previously referred to.

Wall Construction.

The basement of lowest floor of the building is 27ft. below the ground, and is surrounded by a retaining wall of that height, which, however, is not a retaining wall pure and simple, but a vertical floor. The earth pressure is first transmitted to the 8-in. to 7-in. panels between vertical counterforts; these panels being reinforced with 7-16in. diameter horizontal rods, at 4 to 10ins. centres on the inside of wall, and 5-16-in. diameter rods at 8 to 24ins. centres on the outside. Outside these horizontal rods are vertical 5-16-in. diameter rods at 8ins. centres, round which stirrups are placed about every foot in height of the panels. The vertical panel therefore forms a horizontal beam transferring the earth pressure to the vertical counterforts, spaced at average centres of 5ft. 6ins., these in turn transferring the load to horizontal beams. In addition to being a horizontal beam, A is also the slab under the retaining wall, and is constructed as such with links, though its main object is to take the thrust from the counterforts to the bases of the columns next the retaining wall, or to a horizontal beam joining these bases, by means of struts.

The counterforts, 7ins. wide by 14ins. deep, exclusive of thickness of panel, are constructed as vertical beams, with two straight and two bent bars, all 1in. in diameter, stirruped at 5, 6, 7, 8, 9, 10, and 11ins. centres vertically, to take up the shearing stresses.

A beam, 8ins. wide by 16ins. deep, is reinforced with two straight and two bent 1⅛-in. diameter bars, with stirrups, as on the counterforts. In a similar beam the diameter of the bars is less, as the stresses are naturally less. The intermediate beams transfer the earth pressure to the columns next the retaining wall by means of struts, either arched or straight, according to requirements, and this earth pressure may be considered as passing from column to column through the main arched beams to the retaining wall at the other side of the building. The thickness at the base of a brick retaining wall to replace the one built would have to be 10ft.

The external walls of the building above ground floor level where built in reinforced concrete are split up into vertical panels by columns, generally at 35ft. centres. The vertical panels are again split up horizontally at every floor level by beams, which carry them and a small portion of the floor about 6ft. wide. These beams were constructed differently from the usual type of floor beam; their depth was from 18ins. below the floor level to the level of the sill of the window above, a depth which varied at the different floors. They were reinforced with two straight 1½-in. to 2-in. diameter bars at the bottom, and two at the top, connected by means of 7-16-in. to 9-16-in. diameter vertical bars, two to every six inches bent round the horizontal bars at bottom and at top, in the form of a double shepherd's crook (a name by which they were known on the works).

Horizontal 5-16-in. diameter bars were placed at vertical distances of 6ins., parallel to the larger rods, to reinforce the concrete against temperature stresses. Window cleaning galleries were cantilevered out from these beams. The panels between the beams and windows were reinforced with vertical and horizontal 7-16-in. and 5-16-in. diameter rods, at approximate centres of 6ins., the ends of vertical ones passing well into the beams above and below them.

From the preceding description it will be noticed that a wall is more a beam than a wall; in fact, seeing that the same construction is followed between every floor, the external wall might well be regarded as one continuous girder from end to end of the building, with the windows to form open webs.

Floor Construction.

The ground floors were designed to carry 1cwt. per square foot superload, and the first, second, third, and fourth, ¾cwt. in addition to their own weight.

Stanchions were placed as far apart as possible compatible with economy, to give large unobstructed areas, and generally speaking, were 35ft. centres one way, and 34ft. centres the other, though in the centre bay, running east and west, the 35ft. was increased to 45ft., and running north and south the 34ft. was increased to 40ft.

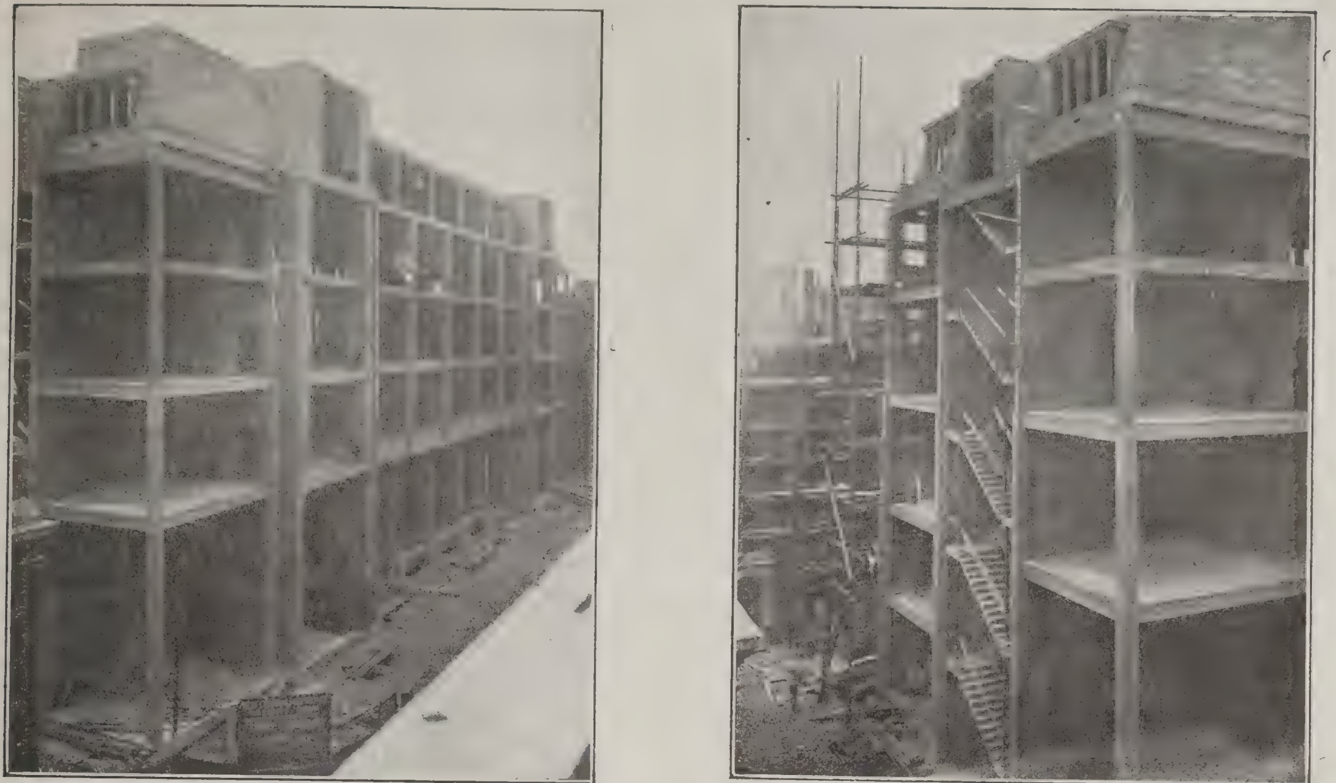
The main arched beams, 35ft. span centre to centre of columns, are 2ft. 6½ins. deep in the centre, 5ft. 3½ins. at the haunches, and 10ins. wide, these depths including the 3½ins. thickness of floor. The reinforcement of these beams consists of two 1⅝-in. diameter bars at top and four 1¾-in. diameter bars at the bottom at the centre of the span. The two lowest 1¾-in. diameter bars follow the curve of the beam to the haunches, then pass horizontally through the columns, and follow the curve of the adjacent beam, projecting into the latter a distance of 2ft.

The two upper bottom bars are horizontal for one-third of the span, and then bend up at a slope of about 15 degs. to the horizontal, till they come to within about 3ins. of the floor level, and are then horizontal for the remainder of their length, passing through the column into the adjacent beam about 2ft., as also do the two top bars, which are straight throughout.

In the haunches a series of horizontal 9-16-in. diameter bars are placed, lapped where passing through the columns some 2ft.

---

*Paper read before the Junior Institution of Engineers.



THE NEW GENERAL POST OFFICE BUILDING, LONDON.

General View of Structural Work from the Front. End Elevation of Public Office Building.

the outer ends bent round as a shepherd's crook and anchored to a ⅞-in. diameter bar embedded across the beam below the main reinforcing bars.

From the ⅞-in. diameter cross bars just mentioned, other shepherd crooks run to the top of the beam, acting as stirrups, and helping effectually to fix the ends of the main beams. Stirrups out of 1½-in. by ⅛-in. hoop steel are also placed round the main bottom bars at right angles to them, extending to the top of the beam, and spaced 8ins. apart at the haunches to 18ins. apart in the centre of the span. Top stirrups hung from top 1⅝-in. diameter bars are also used, and similarly spaced to the lower ones.

These arched beams receive their load from secondary girders, 8ins. wide, 16ins. deep, below floor, or 19½ins. deep overall, at 5ft. 10ins. centres, reinforced with two straight and two curved 1⅛-in. diameter bars, with stirrups out of 1¼in. by ⅛in. hoop steel, at 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, and 16-in. centres, starting from supports to the centre of the beam.

The floors of 5ft. 10ins. span centres are reinforced with 5-16-in. diameter straight and bent bars alternately, at 10-in. centres, continuous over three secondary beams, and overlapping contiguous bars by 12ins. All the straight bars have stirrups out of ⅞-in. by 19-in. B.W.G. hoop steel, at 5ins. and 13ins. from each support, four in each bay. Near the top surface of flooring slab straight 5-16-in. diameter rods are laid at right angles to the reinforcing rods, at 12-in. centres.

This method of construction for the floors, with modifications such as extra straight bars in top flanges of secondary beams, and inverted stirrups, etc., was followed throughout the whole main building, both for floors and roof. The main beams in roof were, however, not arched, but had flat soffit.

The Columns.

The columns carrying the main beams of the typical bay taken, are 28ins. square in the basement, with six 2¼-in. diameter bars and six 2-in. diameter bars, all linked together with 17 links out of 3-16-in. diameter wire every 4ins. in their height. They are 24ins. square from lower ground to ground floor, reinforced with twelve 2-in. diameter bars, with links as above every 5ins. in the height; 20ins. square from ground to first floor, a height of 20ft. 6ins., with twelve 1⅞-in. diameter bars, linked as above; from first to second floor they are 18ins. square, with ten 1⅞-in. diameter bars, with twelve links every 5ins. in their height; from second to third floor, 16ins. square, with eight 1⅝-in. diameter bars, and ten links every 5ins. in their height; from third floor to the roof they are 14ins. square, with four 1⅜-in. diameter bars and four links every 5ins.

Where upper bars stood on lower bars, steam barrel socket pieces, 6ins. long, were provided as sleeves.

These columns were carried on a slab 13ft. 6ins. square, 3ft. 6ins. deep, reinforced with a lower layer of nineteen ⅞-in. diameter bars at 8ins. centres, 1½ins. from the bottom of the slab, and nineteen ⅞-in. diameter at 8ins. centres, immediately above the preceding, and at right angles to them, with twenty-eight stirrups out of 1¼-in. by 1-16-in. hoop steel, 1ft. 9ins. high and 104 1ft. 3ins. high, distributed amongst the nineteen bottom bars. Similar layers of ½-in. and ⅜-in. diameter rods were placed at 10ins., 24ins., and 32ins. above the preceding layers.

The above description is typical of by far the larger proportion of columns and slabs and floor, but of course many special cases were met with, to describe which would occupy more time than is allowed the author. A few special features, however, deserve mention.

Floors, etc., on Cantilevers.

To preserve an unbroken space at the end of the sorting office block, next to the loading yards, so that the loading and unloading of vans might not be impeded by the presence of columns, it was necessary to carry the external wall 52ft. in height and 12ft. 6ins. width of three floors and roof at that end, on cantilevers.

The main arched beams of the building run parallel to this wall, so that the secondary beams were made to cantilever over the first line of arched beams, a distance of 12ft. 6ins., and were tailed down to the second line of arched beams, 21ft. 6ins. back from the first line.

These cantilevers were spaced at 5ft. 10ins. centres, were 11ins. wide by 22ins. deep below floor, and were reinforced with four 1⅞in. diameter bars at top and four 1⅝in. diameter bars in bottom. The two topmost bars extended the whole length of the beam, and their inner ends were bent round the top bars in second line of arched beams referred to above, and thus anchored. Their outer ends passed under the top bars in the fascia beam under the wall. The other two top bars extended from the outer end of cantilever to a point approximately half-way between the first and second line of arched beams, the portion inside the first line of arched beams being bent down till the inner end was slightly below the centre line of the beam.

The four bottom bars extended from the beam under the external wall to the second line of arched beams, and their inner ends were bent round at right angles vertically upwards a length of about 12ins. to form an anchorage or tie in the arched beam. The outer ends were linked to upper bars by means of two ½in. diameter double shepherd's crooks. Stirrups of course were provided of exceptional strength, and were spaced more closely in order to take up the enormous shearing stresses occurring on these beams. The fascia beam joining the ends of cantilevers, and carrying the wall over, was 12ins. wide by 24ins. deep under the floor, and was reinforced with two 1⅛in. diameter rods in the bottom and two 1⅛in. diameter rods in the top, both the top and bottom rods resting on the top and bottom steel bars in the cantilevers.

An Interesting Footbridge.

Another interesting feature is the footbridge connecting the public office block to the sorting office block, at the second floor level, with a span of 50ft. 6ins. in clear. This bridge is of course supported at the sorting office end on the cantilevered secondary beams, bearing on two of these in the second floor and suspended from two in the third floor; all these four secondary beams being suitably strengthened to carry the additional load.

The footbridge is 6ft. 6ins. in width inside, with walls 5ins. thick, and 9ft. 6ins. from the floor level to the underside of roof over. The walls each have thirteen windows in them, and the same principle is followed in their construction as in the external walls of the buildings; that part of wall below sill level of windows being a beam 5ins. wide, reinforced with two 1⅞in. diameter rods at bottom and two at the top, linked together with double shepherd's crooks, $\frac{7}{16}$ in. and ½in. diameter every 6ins. in length.

These beams at the public office end rest directly on the wall, which at this part is constructed 12ins. thick. The lower bars pass through the wall and extend into a bracket below the second floor, about 2ft., being thus amply anchored, whilst the upper bars have their ends bent round at right angles for a length of 2ft., the ends being on the inner side of the inner horizontal bars in the wall of the public office block. When the centering was struck from under this bridge the sag was imperceptible, and when tested with 50 per cent overload over the whole area the deflection did not exceed 1-12,000th of the span.

Chimney of Special Construction.

The chimney may be mentioned as another feature where special construction was necessitated, being exceedingly heavily reinforced. Its height is 130ft.; the internal dimensions at the bottom are 5ft. 2ins. by 4ft. 8ins., at top 4ft. by 3ft. 6ins.; the opening in one side for flue is 7ft. 7½ins. high, the whole width of flue.

The wall at bottom is 8in. thick for a height of 50ft., at which point the internal dimensions of the shaft are reduced to 4ft. by 3ft. 6ins., and a special belt is formed to carry the upper length. The walls of the shaft are 9ins. thick at this point, gradually decreasing to 6ins. at the top. The 8in. walls at the bottom are reinforced with twelve 1⅜in. diameter vertical bars, six on each side of the flue opening, and with forty-six 1in. diameter vertical bars (twenty-two internal and twenty-four external ones). Above the flue opening the 1⅜in. diameter bars were dispensed with, but the number of external bars was increased to forty-six of 1in. diameter and internal bars to forty-two $\frac{15}{16}$ in. diameter. These were carried up to a height of about 50ft., where the altered size of shaft occurred and the number of external bars became thirty-eight of $\frac{15}{16}$ in. diameter and internal thirty $\frac{15}{16}$ in. diameter. These extended for 24ft., when the external bars were decreased in diameter to ⅞in., and the internal to ¾in. This number of external bars was maintained to the top of the chimney, but the diameter of the bars was gradually decreased to ¾in.

The internal bars were omitted altogether in the top 20ft. of shaft, and halved in number for the 20ft. below that. Stirrups were placed on every third pair of internal and external bars, at vertical intervals of about 12ins. all the way up the chimney. Immediately inside both the internal and external bars horizontal bars at 8in. centres of $\frac{7}{16}$ in. diameter, were placed bent round at right angles at the corners and overlapping each other about 9ins.

The interior of the chimney was lined for the first 50ft. in height with fire brick, and foot-irons were provided and embedded in the concrete as the work proceeded.

Tunnels.

Two tunnels under King Edward Street, connecting the basement of the new building to that of the building on the opposite side of the road, were constructed. The larger tunnel is 7ft. 6ins. wide by 8ft. high, with segmental top; the smaller, 5ft. wide and 6ft. 6ins. high; both are about 60ft. long. The construction of both tunnels was alike, and consisted in the larger one of a bottom, walls and roof, all 9ins. thick.

The bottom was constructed as an inverted floor, with alternate straight and curved bars every 6ins., ¾in. in diameter, the ends of same being bent round square and up into walls 12ins.

The walls were reinforced with ¾in. diameter internal bars every 6ins., and ½in. diameter external bars every 6ins, in pairs; ⅜in. diameter horizontal bars were placed outside both the external and internal bars, and touching them every 8ins. in height; the internal vertical bars being stirruped at intervals of about a foot.

The segmental top was reinforced with cross-bars bent to the shape of segment in lower and top surface. The upper ones $\frac{11}{16}$ in. diameter, every 12ins., the lower $\frac{13}{16}$ in. diameter also every 12ins., the latter being stirruped; ⅜in. longitudinal bars were also added, resting on lower and upper bars at 8in. centres.

Staircases.

The staircases are all very similar in construction, but the most noticeable is the south one (in the public office block), which will now be briefly described.

The main flight of stairs consists of 13 steps with a landing at the bottom 4ft. 7½ins. long, and at top 4ft. 4½ins. long. This flight, including the landings, is constructed as a slab, 4ins. thick, 4ft. 6ins. wide, with two bends in it, of a span between walls of 19ft. 1½ins. on the horizontal. This slab, in addition to carrying itself, the steps, and superload on same, carries one end of each of the upper and lower flights of stairs, the strings of these latter being suspended to the steel reinforcement in the slab, and receiving additional support from cantilever bars embedded in walls. The reinforcement consists of nine ⅝in. diameter bars, five straight, and four curved, all bent to shape of stairs and landings. The straight bars have twelve stirrups each, passing up into the nose of every step. The curved bars have no stirrups, but are bent up so that they follow the top surface of landings, about ½in. below same. Both straight and curved bars have a 5in. bearing in walls; ⅜in. diameter horizontal bars are placed immediately above the straight bars at 12in. centres, merely as a tie to the concrete.

Difficulties in Construction.

In carrying out the work many difficulties were met with, not the least of which was the construction of the retaining walls, which, though only 8ins. thick in the thinnest part, required a trench 58ft. wide in places in order that it might be properly constructed.

This was due to the monolithic nature of reinforced concrete and to the fact that the main beams were continuous from side to side of the building. The width of the trench was therefore settled by the length of these bars to be at least 54ft. wide, and by increasing this to 58ft., it was possible to finish the bases to the second row of columns parallel to the retaining wall, and consequently this width was adopted, so that when the retaining wall was finished the first and second rows of columns were concreted up to the ground floor level. The bay of flooring between these two rows of columns

THE NEW GENERAL POST OFFICE BUILDING, LONDON. GENERAL VIEW FROM THE BACK.

at lower ground floor level was also concreted.

Special arrangements had to be made to house the bars of the main beam in the second bay in the columns in the second row after these columns had been constructed to ground floor level. A pocket 5ft. 6ins. deep, and half the width of column one way and 12ins. wide on face of column, was left, and the bars in main beam (2) were bent at right angles for a distance of 5ft., and this 5ft. passed vertically up the column inside the links, which latter were at these pockets made on the column bars themselves after the beam bars were fixed.

The timbering of the trench which extended round three sides of the site was done in the usual way, a row of piles being driven down the centre of trench and ground excavated in 3ft. layers, poling boards, walings and struts to piles being fixed every 3ft. in height. When the bottom of the trench was reached the bars for the slabs under the retaining wall and columns were first put in, and for the struts from this slab to column base and both slabs and struts and column base concreted, the centering for counterforts was fixed, back shuttering 3ft. high for retaining wall was fixed, the bars in counterforts stood up in place, and also the vertical bars in the thin panels of retaining wall, the top ends of which were all fastened to a horizontal batten to keep them from bending over and to maintain them at the right distance apart.

The wall was then concreted 3ft. high in 6in. or 7in. stages, according to the width of the centering boards used. The back shuttering was then removed, and the space between the back of the retaining wall and the earth filled with ordinary brick or ballast Portland cement concrete 8 to 1.

The next line of struts, walings and poling boards was then removed, the back shuttering inserted behind the reinforcing bars, and the process described above repeated.

The columns were carried up simultaneously, and as the struts above were removed, fresh struts from the newly concreted retaining walls to the piles were fixed, to take the earth pressure while the concrete was green. When the lower ground floor level was reached, the lower centering boards were removed and used in the upper half of the retaining wall. It may be stated here that all centering timber was 2ins. thick, the necessity for absolutely rigidity being a governing factor. The centering for the basement was all wrought to give the concrete a smooth face, to which a coat of limewash gave the finishing touch.

In constructing the centering for the floors, poles were used as props under the main and secondary beams, and as they had to be left practically till the topmost floors had been constructed, arrangements were devised and adopted in order to release the centering under the flooring slabs, and at the side of the beams without touching the beam bottoms.

For the walls, timber profiles of 4ins. by 3ins. scantling were first fixed, and shuttering for one side of wall placed in position up to the next floor level, and the centering on other side fixed as the wall was concreted. The 4 by 3 profiles were bolted together with ¾in. or ⅝in. diameter bolts, and distance pieces were placed between them at intervals as necessary.

For the ventilating ducts and cable ducts various methods of centering were tried, but the most efficacious were cores made of ¾in. timber in 6ft. lengths, which were collapsed and drawn up every 6ft. in height of wall or column, so that generally speaking, where these vertical ducts occurred the utmost height that could be concreted in a day was 6ft.

The flues for the chimneys were lined with 9in. diameter fireclay tubes, which were inserted as the walls in which the chimneys occurred were built.

Composition and Mixing of Concrete.

The concrete was specified to be, for all work below ground floor level:—1 yard of ¾ ballast, ½ yard sand, and 7cwt. cement; above the ground floor, 6cwts. of cement. The extra 1cwt. of cement for work below the ground floor was chiefly on account of the retaining walls, which with this extra 1 cwt. were made watertight, the necessity for a vertical damp course outside being thus avoided. All concrete was machine-mixed, batch mixers being employed. Thames ballast was used for the aggregate throughout the work, and a special screening and crushing plant was installed to separate the sand from the ballast and to break the larger stones down to the ¾in. size specified.

The steel had to conform to the British Standard specification, and was all bent, caulked, twisted, etc., on the site, about 3,000 tons being used in the work.

Testing the Work.

During the course of the work, test columns were constructed 9ins. square, 6ft. long, with four 1in. diameter rods. These were tested at Messrs. Kirkaldy's 105 days after being made. Curves were also plotted. The results are interesting, but much more might be done in this direction.

Examination of the specimens after destruction went to show that some of the bars being longer than others, the stress came on them unequally, the longer ones being bent much more than the shorter ones.

Of course this may have occurred after destruction had taken place, but in the author's opinion it would be well in future tests for the load to be applied to the concrete only and transmitted from the concrete to the steel bars, as is actually the case in buildings.

The buildings were designed by Sir Henry Tanner, I.S.O.; the ferro-concrete design has been worked out on the Hennebique system. Messrs. Holloway Bros. (London), Ltd., were the contractors.

Federation News.

BURTON-ON-TRENT ASSOCIATION.

Secretary: A. W. Chamberlain.

A general meeting of the Burton-on-Trent Association was held on November 23rd, Alderman Lowe, J.P., in the chair.

After considerable discussion of the resolution passed at the half-yearly meeting of the National Federation at Portsmouth, it was resolved that the secretary write to each member of this association on the subject of priced schedules, calling attention to Rule 10, section M, of the association's rules, which reads as follows: "That, without the consent of the Emergency Committee, on no consideration should priced schedules be sent in along with tenders by members of this assosiation, except under separate cover, the same to be returned unopened if not accepted."

It was resolved that this association collect from its members £20 during the year 1910, towards the National Reserve Fund.

After discussing the terms of the agreement with the N.A.O.P., representatives to serve on a joint committee with representatives of the plasterers were nominated, and the secretary was instructed to arrange the first meeting.

It was pointed out by the secretary in reference to Rule 2, qualification of members, that two of the master plasterers belonging to this association are still members of the N.A.O.P., and that in addition to being a trade society the N.A.O.P. is a friendly society, and it was resolved that the following be added to Rule 2: "Except in the case of master plasterers."

A discussion arose in respect to the recent advertisement in local papers for certain works required by the Education Committee to be done during the Christmas holidays, payment for which is not to be made until three months after completion. It was also mentioned that the Education Committee had recently given works to manufacturing firms away from Burton, and it was resolved that in both instances letters of protest should be sent to the chairman of the Education Committee.

It was resolved to hold the annual meeting and dinner on Saturday, January 29th, 1910, and to invite Colonel Barnsley, of Birmingham, who will be the President of the Midland Centre, to attend.

At a meeting of the Burton-on-Trent Buildin Trades Local Conciliation Board, held at the Station Hotel on Tuesday, November 23rd, Alderman Lowe, J.P., in the chair, the Board carefully read the recent additions made to the rules which were passed at the annual meeting of the National Board, held in London on May 25th, 1909.

The employers' secretary was instructed to furnish the operative secretary with a copy of the alteration and additions to the rules as proposed by several trade unions.

PORTSMOUTH ASSOCIATION.

Secretary: F. B. Roskell.

The quarterly general meeting of the Portsmouth Master Builders and Building Trades Association was held at the Sussex Hotel on November 16th (Mr. G. J. Davis, president, in the chair), when a large and representative gathering assembled.

At the commencement of the meeting, the members all standing, passed a vote of condolence with the family of the late Sir John Baker, M.P. for Portsmouth, and late hon. member of this association.

Correspondence was then read, which had been dealt with by the committee since the last general meeting.

With regard to the question of quantities being returned to the unsuccessful contractor, the secretary was instructed to write to the local authorities requesting that in future bills of quantities may be returned as soon as possible after the contract had been placed as in several instances they had been withheld for some months.

The members' attention was then drawn to the recent formation of a Speculative Builders' Society in this town, and after a lengthy discussion on this subject, it was unanimously agreed that the one association should be the best protection for the trade, and that good results could not be expected from a second organisation. The secretary was therefore directed to write to the Speculative Builders' Society asking them to appoint a deputation to meet the Master Builders' Association with a view to discussing the desirability of their joining up with this association and pointing out the mutual benefit which would ensue from amalgamation.

Organisation and means of improving the welfare of the association was then brought forward, when several useful suggestions were made and noted for the consideration of the committee.

It was also decided, with regard to the forthcoming Christmas holidays, that a circular should be sent to each of the members recommending that works be closed from the Friday night to the following Wednesday morning.

Mr. Salter then drew the attention of the members to the report of an important decision, which appeared in the issue for November 3rd of the "Builders' Journal," relating to the appeal, W. Kennedy, Ltd.; and Mayor and Corporation of Barrow-in-Furness turning on the question, "What is an Arbitration Clause?" which he considered was one of great interest to all builders. Continuing, he hoped all builders present would strongly support the "Builders' Journal," which was the official organ of the National Federation of Building Trade Employers.

The meeting then closed with a hearty vote of thanks to the president.

LEEDS ASSOCIATION.

Secretary: J. Davidson.

The annual meeting of the Leeds Association was held at the Grand Central Hotel, Leeds, on Tuesday, November 16th. Mr. W. Irwin occupied the chair, and was supported by several members.

The minutes of last annual meeting were read and approved. As the annual report and cash statement had been printed and circulated among the members, Mr. Irwin moved its adoption. In doing so, he referred to the agitation of the employees of the Corporation to obtain concessions as regards walking time, car fares, etc., beyond those recognised in the standard conditions. The Corporation had been reminded that the standard conditions were almost uniformly accepted in other parts of the country, and that many advantages accrue to local authorities from following this procedure.

The Highways Department of the Corporation, after hearing the view of representatives of the association, had reverted to the charges for highway repairs being based on measurement instead of time.

The adoption of the report and cash statement was seconded by Mr. P. Rhodes, and unanimously approved.

Mr. W. T. Ledgard, in proposing that Mr. Irwin be elected as president for the ensuing year, referred in appreciative terms to the valuable services which he had rendered during the past two years, and stated that it was the unanimous wish of the members that Mr. Irwin should accept office for another year. The motion was seconded by Mr. J. H. Tomlinson, and carried with acclamation. Mr. O. Mawson was re-elected vice-president.

On the motion of the President, seconded by Mr. Appleyard, a cordial vote of thanks was tendered to Messrs. E. Umpleby and G. W. Nettleton for their services as honorary auditors. Messrs. G. W. Nettleton and G. W. Wilson were appointed auditors for the coming year. The following gentlemen were appointed to represent the association on the Yorkshire Federation: Messrs. W. Irwin, O. Mawson, J. H. Tomlinson, G. W. Nettleton, F. Mountain, and S. Worsnop. The trade committees and Local Conciliation Board were also appointed.

The President reported that arrangements had been made with the Yorkshire Federation, and the secretary, for the Leeds Association to share in the tenancy and benefit of larger offices which had been taken in West Bar Chambers, Boar Lane, Leeds. The offices would afford ample accommodation for the ordinary meetings of the association, and would give it a definite and official habitation.

On the motion of Mr. P. J. Pickard, seconded by Mr. P. Rhodes, the action of the president and committee was confirmed, and the terms of the tenancy and arrangements for furnishing were referred to the president and Messrs. W. T. Ledgard and J. H. Tomlinson.

The sub-contract form submitted by the Yorkshire Federation was carefully considered, and, on the motion of Mr. F. Mountain, seconded by Mr. J. Dobson, the draft was generally approved.

At the conclusion of the business, the president entertained the members to tea.

PRESTON ASSOCIATION.

Secretary: John Tomlison.

The sixteenth annual dinner of the Preston Building Trades Employers' Association was held on November 10th, in the Boardroom at the association offices, Mount Street, Preston, when the president, Mr. R. H. Catterall, was in the chair, and was supported by Messrs. S. Salthouse and J. Croft, the vice-presidents, T. B. Barnett and W. Croasdale, ex-presidents, W. Cooke, junr., hon. treasurer, the assistant secretary, and about fifty members and friends.

After the usual loyal toasts, the President referred with regret to the absence of the members of one firm through a recent family bereavement, and asked for a vote of condolence and sympathy with Mr. John Cartmell in the loss of his wife. He also read a letter from Mr. John Tomlison, the secretary, apologising for non-attendance through illness, and stating that this was the first annual dinner he had missed for the last sixteen years.

Mr. T. B. Garnett proposed the toast of "The Lancashire, Cheshire, and North Wales Federation," and said he thought the Federation was doing very useful and necessary work in bringing the local associations into closer union, and thus improving their power for good. He personally had not had much practical experience of Federation work, but Mr. Cooke, who would respond to the toast, would be able to tell them more on that subject. He considered it a great honour to Preston that for the second time they had a Preston man president of the Federation, and he heartily congratulated Mr. Cooke on having attained that position.

Mr. Cooke, on rising to respond, met with a hearty reception; he thanked the members present for their kind appreciation, and said he also felt the honour of his position very much, and was glad he was a Preston man. Preston played a very important part in Federation work, perhaps more than many of their members imagined. It was looked up to by other local associations with very great respect, as being an example of first-class organisation second to none in the country. He then proceeded to give a very detailed account of the Federation and its works, its composition, membership, and the recent cases it had dealt with, concluding his remarks with an appreciative reference to the National Council and the Employers' Parliamentary Council, which observations were received with applause.

Mr. Walter Hoyle, in a short speech, proposed the toast of "The Preston Building Trades Employers' Association," and Mr. W. Croft (Messrs. T. Croft and Sons, Ltd.), in responding, said that theirs was an organisation they could not very well do without. The firm he represented had been members now for so many years, that, looking back to their first connection with it, seemed like ancient history. They had received many benefits from closer association with their fellow-employers, and he ventured to think that there were few if any members who did not feel with him that it would be a calamity indeed if ever anything should occur to break up their society. The old-time antagonistic feeling with regard to the operatives was passing away, and it was becoming a pleasure to meet them and discuss in a conciliatory manner all they had to urge for the betterment of their condition or the trade.

Mr. Shorrock, in proposing the toast of "The President and Officers," said they all knew the President and recognised that he had necessarily gone through a lot of hard work before he had attained the highest position in their society. He was a man of sterling worth, and strong opinions, which he did not fear to express. Mr. Shorrock also paid a high tribute to the other officers, the hon. treasurer and the secretary, whom he regretted not to see there that evening.

Mr. Catterall, in reply, thanked the members for their kind reception of the toast, but was of opinion that more thanks should be given to the Committee, as that body did the best and most important work—work that was very often difficult, and required a great deal of thought and tact to carry out successfully. Passing to other matters, he referred to what he considered the unsatisfactory condition of the trade at the present time, both locally and nationally. Were, he asked, members satisfied to conduct their business under present conditions and difficulties? He was of opinion they were not, and that something would have to be done very soon to try to improve matters.

Mr. S. Salthouse, the senior vice-president, and Mr. F. Starkie, the hon. solicitor, having also responded, a musical programme was then proceeded with, and a most enjoyable evening was spent in social intercourse.

NOTTINGHAM ASSOCIATION.

Secretary: W. J. Barton, F.C.I.S.

At the last annual meeting of the Nottingham Association, Mr. H. R. Thompson (of Messrs. F. M. Thompson and Sons, Ltd.) read a very interesting and instructive paper on the inter-trading rule, after which the Executive Committee were directed to give the subject their further consideration. In accordance with this wish, the Executive invited Mr. A. G. White (the National secretary) to come and give the members some further information on the advantages and working of the rule. Mr. White very kindly consented, and gave a most instructive and illuminating paper on the rule and the many advantages to be obtained, both locally and nationally, by widening the scope of associations. A resolution was passed at the meeting deciding to adopt the rule at an early date. The Executive Committee then took up the whole question of the association's rules, and after full consideration of the question, decided to recommend to the members that the title of the association should be altered, and that an entirely new set of rules should be adopted, and accordingly set to work to draft the same. The title suggested was "The Nottingham and District Association of Building Trades Employers." The model set of rules, as recommended by the Conference of secretaries, was taken as a basis for the new rules, and the proposals of the committee have just been submitted to a general meeting of the Association, each member having been supplied with a copy of the proposed rules with his notice of the meeting.

The meeting was well attended, and after some criticism on one or two points, and explanations given on other points, the whole of the rules as proposed by the committee were accepted and adopted, with one addition only.

It may be of interest to other associations to indicate the points on which the rules now, as adopted, differ from the model set.

Constitution.—We provide that associate and honorary members shall not be entitled to attend or vote at any business meeting of the association, except on the invitation of the administrative committee.

Election of members.—We provide that the proposer of any applicant who is not elected, shall have power of appeal to the next general meeting.

Management.—(a) We provide that the Council shall meet as required, instead of fixing definite times for meetings. (b) Cheques may be signed by the President, or a Vice-president and the Treasurer.

Funds.—(a) Ordinary members may have the option of having the amount of their subscription assessed at 8 guineas per annum in lieu of making a wage return. (b) The minimum annual subscription for ordinary members shall be 15s.

After this clause we have inserted the following note:—The official journal of the Federation will be supplied by the Association, each week free of cost, to all ordinary members whose subscription is paid for the current year.

The secretary fully appreciates the benefit he has received from attending the Conferences of Secretaries, and the assistance given him by various secretaries, and will be pleased to reciprocate by forwarding a copy of the rules as soon as received from the Press, or by giving any information to associations who may be contemplating a change in their rules.

BRADFORD ASSOCIATION.

Secretary: J. Davidson.

A general meeting of the Bradford Association was held at the Builders' Exchange, Bradford, on Tuesday, November 23rd. Mr. T. E. Taylor occupied the chair, and was supported by several members.

The clauses of the Bradford Corporation Bill were read and discussed, and it was resolved to defer consideration until the next meeting.

The proceedings of the Yorkshire Federation were read, and special attention was drawn to several matters of interest.

The question of officers and committees for the ensuing year was considered, and several nominations were made.

It was arranged to hold the annual meeting on Tuesday, December 21st.

L. & C. HARDTMUTH'S
KOH-I-NOOR PENCIL

is the most economical Pencil made. It lasts six times as long as an ordinary pencil. But it is the velvety smoothness of the lead that is the great charm of the Koh-I-Noor. There is no other pencil that nearly approaches its quality The lead of the Koh-I-Noor is specially prepared by a perfected process which gives it a firmness yet delicacy of touch that cannot be imitated. The Koh-I-Noor is made in seventeen degrees to suit all pencil purposes.

Koh-I-Noor Pencils are **4d.** each, and **3s. 6d.** per dozen, everywhere. Of Stationers, Artists' Colourmen, Photographic Dealers, &c. Booklet free from

L. & C. HARDTMUTH,
12, Golden Lane, London, E.C.

KOH-I-NOOR
TRACING CLOTH

Is a stout and substantial cloth possessing every advantage for the drawing room. Its surface is smooth and clear, free from blotches. Does not tear or break. Is transparent enough for the finest work. Erasures may be freely made without causing the ink to run. Is excellent for giving impressions by process

THE GREATEST SATISFACTION IN USING THIS SPECIALITY IS FOUND IN ALL DRAWING OFFICES.

Of Stationers, Artists' Colourmen, Photographic Dealers, &c.

Coloured Buildings.

Mr. Halsey Ricardo wants "to see the streets of our crowded towns bright and splendid with colour," and in furtherance of this desire he gladly responded to an invitation to open a discussion by the Architectural Association Debating Society—a most useful institution, whose proceedings deserve much more attention than they have yet received—on the proposition "That external colour decoration is necessary to the completion of town architecture." Mr. Ricardo's support of this proposition was no merely perfunctory effort. He has long been an earnest advocate of the principle involved; and on this occasion he supported the thesis with heart-whole sincerity and with almost poetical fervour. He claims, without much risk of contradiction, that the craving for colour is innate and instinctive. The demand for it is imperative. And yet, as he says, "for half the year our city is the colour of a dirty cobweb, and the only refreshment the eye gets is in the glimpses of the sky overhead, the shop windows, and the hoardings," the latter significantly marking the hunger for colour. The only question is: By what external treatment can our buildings be made to gratify the certainly growing demand for colour? Mr. Ricardo thinks that, if permanence of material is to be a prime condition, glazed surfaces—glazed terra-cotta, glazed bricks, tiles, and glass mosaic—supply the answer. The contemptuous disdain of "crockery-ware" frontages has then to be reckoned with. Mr. Ricardo apparently feels confident that this objection will disappear when these materials are employed with greater taste and propriety; and the contention that these surfaces glare unpleasantly loses much of its force in a sombre climate like ours. The alternative is paint, and plenty of it. "Paint," says Mr. Ricardo, "especially water paint, is what one ought to indulge in profusely." He admires, only less enthusiastically than did Mr. Max Judge, in his excellent descriptive article contributed to this journal, the colouring of the Athenæum Club, but regrets that in this instance the Decorative Committee did not show greater daring. The plea is for greater audacity, for positive blazonry. Colour in delicate and subtle suggestion is omnipresent. A plain brick wall in the sunlight has more tints than the painter could find on his palette, but most of them are perhaps only visible to the most sensitive eye, and then only upon rare opportunities. The danger is that the broad masses of colour which would bring joy to the man in the street might mean æsthetic agony to the artistic soul. The proposition, however, was carried after a somewhat listless—or, as one may say, colourless—discussion, in which several of the speakers extolled the amenities of whitewash; while one gentleman threw out the very practical suggestion that reinforced concrete, possessing no natural beauty of surface, offered a good field for colour. A point that seems to have been overlooked—or was it thought to be too obvious to need emphasis?—is that the new Town Planning Act may give that very necessary control of colour which has been hitherto lacking. Riotous anarchy of colour in our streets is appalling to contemplate; whereas, some well-devised general scheme of external colour decoration would probably disarm most of the adverse critics.

Inspiration and Imitation.

One advantage of "movable" conferences, such as those held by the National Federation of Building Trades Employers, is that they afford the means of instructive comparisons between the notable buildings of the various towns visited. The half-yearly meeting at Portsmouth last summer, for instance, when the Federation delegates met in the magnificent town hall, lent much additional interest to one's view of the grand town hall at Leeds, in which city the conference of secretaries was held in October. The one building is strongly reminiscent of the other. This resemblance was duly noted in a lecture delivered last week by Mr. Butler Wilson before the Leeds and Yorkshire Architectural Society on "The Life and Work of Cuthbert Brodrick." That the similarity is by no means accidental may be inferred from the fact that the architect of the Portsmouth building, Mr. William Hill, F.R.I.B.A., was a Leeds man, while the contractors, Messrs. Armitage and Hodgson, were also of Leeds. The Leeds influence on Portsmouth is therefore natural. Rather curiously, the Leeds tower, as Mr. Butler Wilson reminds us, was an after-thought. We can hardly agree with him that "it is only by a stretch of the imagination reminiscent of Wren's city churches and the western towers of St. Paul's." On the contrary, the resemblance immediately impresses the Londoner, and it seems hardly more possible to suppose that Brodrick was not inspired by Wren than that Hill was not indebted to Brodrick; and we do not see that in either case the fact detracts from the merit of the design. So far as a merely mental comparison of the three buildings can serve us, we should say that the resemblance is merely general, and of the character of a strong family likeness; which, as Mr. Butler Wilson remarked, extends to the towers of at least two other town halls, those of Bolton and Morley. Neither Brodrick nor Hill was guilty of plagiarism. They simply adopted the soundly sensible and scholarly course of following or adapting models of established excellence; which was exactly what Wren and Inigo Jones, and Brunelleschi, and all the great masters, always took care to do; but they did it with splendid discretion. Between inspiration and imitation there is a world of difference.

The Education Question.

There was no whit of exaggeration in the statement made the other day by Mr. J. L. Ball, Director of the School of Architecture, at the Municipal School of Art, Birmingham, to the effect that all who are interested in architecture as a fine art have long felt grave anxiety about the education of architects in this country. Mr. Ball was no doubt only too accurate, also, in his statement that the old relation of master and pupil, admirable in theory, and successful enough under favourable circumstances, has in the main broken down under the changed conditions of modern life. He was on less firm ground, however, when—unless he has been misreported—he said that "it was proposed to substitute for the old premiated pupilage—at its best a somewhat casual and haphazard arrangement—a systematic course of training in an architectural school." If for "substitute for" we may be permitted to read "supplement," we shall probably be nearer a consensus. Perhaps that is what Mr. Ball means; for he goes on to state that after two years of training at the school the student would enter an architect's office, still devoting part of his time to working in the school, and it is only reasonable to suppose that the architect would require him to be articled and would demand a premium. The old system, we take it, is not to be eradicated, but is to be profoundly modified. Before this reform can become general, there is very much to be done. Local facilities for the kind of training required are very inadequate. There are outlying districts whence it is impracticable to send the student to London, or Liverpool, or Birmingham, or Edinburgh, for his school training in architecture. Then, even where distance is no barrier, and expense is not a prohibitive consideration, there is the obstacle that at present the master cannot be compelled to send his pupil to school. Various architectural associations are doing splendidly enlightened and courageous work in promoting the claims of architecture to consideration by universities and schools; but co-ordination, and perhaps some form of compulsion—whether moral or legal—seems to us to be a crying necessity of the case, if we are to avoid cross-purposes, a lamentable waste of effort, and chaotic differentiation of results. Anxiety as to the education of the architect will not be allayed until the status of the architect is more strictly defined and more firmly established. If the Royal Institute can obtain the powers it is seeking from Parliament, plenary authority over the education of the architect may be expected to follow as a matter of course, and the Institute will be able to exercise as much educational control as that which is entrusted, for example, to the incorporated lawyers or the Council of Legal Education. Until then we must rub along as best we can. We must not stand still, however, awaiting events that may never happen; and hence we are glad to welcome and encourage such plucky endeavours to grapple with the subject as those which are being made at Birmingham and elsewhere. Nevertheless, the education of the architect is a subject of national, rather than of local, concern and importance. We might go even farther and say that it should assume an international character, but that were to risk leaping a chasm that may soon be safely bridged.

The Imperial View.

The annual dinner of the Tyne and Blyth District Building Trades Federation, held last week in Newcastle, was remarkably fortunate in its principal speakers, who dealt trenchantly with several matters of momentous interest to the building industry. Councillor J. T. Armstrong, of South Shields, in demonstrating the usefulness of the Federation, cited the following clause from the "conditions" which a certain municipal authority sought to impose upon the contractors: "In the event of anything evidently necessary to the due and complete performance of the works being omitted to be shown in the drawings, or being omitted to be described in the bill of quantities and specification through oversight or error or otherwise, the contractor is, notwithstanding, to execute in the most perfect and complete manner all such works as if they had been severally shown and described, without any extra claim or charge, according to the direction of the architect and to his satisfaction." That, he said, was the sort of thing the Federation was trying to put down. He did not elaborate an argument; the bare quotation was sufficient, and was, as Mr. J. W. White observed, "a nice quiet way of administering the castigation that such a condition deserved." This speaker addressed himself more particularly to the great burdens that have been recently imposed on employers by legislative interference. He was dissatisfied with the administration of the Workmen's Compensation Act. The way in which claims are being dealt with by county court judges is significantly indicated by the fact that insurance rates are still going up, and he threw out the valuable suggestion that such cases ought to be tried by medical referees. The President (Mr. W. T. Weir, of Howdon-on-Tyne) also foreshadowed an important item of constructive policy. Complaining that while the majority of builders were contributing very largely to establish and maintain the Federation, there were some who were deriving all the benefits for which the members of the Federation are working and paying, but who would, nevertheless, neither stir a finger nor pay a penny, he added that apparently the same observation applied to the architects and the quantity surveyors. "Those professions," he said, "had established associations for mutual protection, yet there were men who kept outside, and whenever they got the chance undercut and took work at any price. He hoped that the time was not far distant when the builders, and the architects, and the quantity surveyors, would so co-operate with each other that it would be impossible for that sort of thing to happen." Certainly we see nothing Utopian in the prospect. Such a defensive alliance is well within the bounds of possibility. It is only necessary to devise some mutually satisfactory means of linking up the various organisations into a larger federation. Such an imperial policy, such a consolidation of building interests, is being constantly and consistently advocated in these pages, because we realise very clearly that architects, quantity surveyors, and contractors, having very many interests in common, ought therefore to sink all minor differences, and combine for mutual advantage. It is for this reason that we deprecate as unwise and untoward any exaggeration of merely sectional grievances or antipathies, or any course of action that has a tendency to destroy the better understanding which is rapidly becoming established as between the professional and the practical elements of the great industry which it is our earnest endeavour to serve, not sectionally, but as a whole. Adopting a homely and hackneyed but expressive phrase, we may say that we conceive the professional man and the man of business to be in the same boat, and we want to see them pulling together.

Posthumous Honours.

Seldom indeed is the memory of a great architect accorded national honours. Usually he rests in an unregarded grave. This, for the greater part of a century, was the unmerited fate of Pierre C. L'Enfant, who, as readers of this journal need not be informed, was the Father of American architecture. Some months ago the "Western Architect" called attention to the fact that the remains of L'Enfant were contained in a grass-covered deserted grave in a farmhouse yard in Maryland. Now, in the words of our contemporary, "with the honours of war [let it not be forgotten that L'Enfant held the rank of Major] his remains are conveyed to the capitol of the nation, and the Vice-President of the United States that he served, and the ambassador of his native country, tell the vast assembly gathered to do honour to his memory of the life and work of L'Enfant, and he is buried at Arlington with the highest honours the nation accords to its military dead." We must confess to serious misgivings on two points—whether it would not have been, on the whole, more seemly to leave the poor ashes undisturbed after a century of neglect; and whether the extraordinarily belated honour was not accorded to the soldier rather than to the architect. But, anyhow, let it pass for a pious act, promptly enough performed when once the national conscience was awakened, and all the more graceful and generous from the circumstance that L'Enfant was of foreign birth.

Our "Edition de Luxe."

Our publishers announce that the demand for the "Builders' Journal Edition de Luxe," which is an extra number, dated December 31st, and to be issued at one shilling net, has, up to date, exceeded all anticipations. Guided by the experience of last year, when many regular subscribers expressed their keen disappointment at being unable to obtain the special issue, we have this year arranged for a greatly increased supply. The private orders, however, are already so numerous as to give rise to the expectation, amounting almost to certainty, that those subscribers who make late application will not be able to secure copies. Unfortunately, the supply cannot be regulated to correspond with the demand, because the earlier sheets of the work are already printed. As we earnestly desire that regular subscribers, who undoubtedly have the first claim to consideration in this matter, may not again be balked of their desire to possess this splendid special issue, we again urge them, in order to gratify their own desire and our very natural wish to accommodate them, to send at once for the copies they require. The wish to possess this fine special issue is easily understood. It contains not only a large and important section dealing with the very remarkable development of American architecture, with fine illustrations of the most important buildings in the United States, portraits of notable American architects, and pithy accounts of their careers and achievements, but, further, it gives a series of splendid illustrations of the most important current work of some of the leading British architects of to-day. Again, it deals succinctly with the progress that has been made during the year in the rapidly expanding field of reinforced concrete work, a subject on which this journal may claim to be the best informed of all trade papers. The building events of the year, and the chief transactions of representative professional and industrial organisations, are also chronicled, while the proceedings in Parliament affecting the profession and industry of building will be tersely summarised. Altogether the Edition de Luxe will be found to surpass in interest and in value anything of the kind that has ever been issued from the press. In mere bulk it would be an unrivalled monument to publishing enterprise of the kind; but its intrinsic merits, and its permanent interest render it a really covetable possession, which will be stored and treasured by all who are so fortunate as to secure it. We feel a certain measure of responsibility towards our regular subscribers in the matter of supply; and it is because we are anxious to avoid disappointing them that we again urge them to book their orders without delay.

We are informed that, owing to the great demand for the patent Manchester grate, stove, and ventilators, Messrs. E. H. Shorland and Brother, of Manchester, have been compelled to largely extend their works, and they have accordingly removed to new premises, viz., the Manchester Stove Works, Failsworth, Manchester. The change in address has necessitated alterations in their telegraphic address and telephone number, which now are respectively: Shorland, Failsworth and No. 319, Failsworth, Manchester.

MORE LESSONS FROM MESSINA.

The Stability of Arched Construction.

By A. G. H. Thatcher.

A careful examination of many of the wrecked buildings forced at least one definite conclusion. It is most difficult to give any suggestion for the rebuilding which could be put forward as a rule. There are too many indefinite elements to be considered. One of the first noted was that the rigidity of the structure had to be much discounted on account of the heterogeneous materials of which they are built. Stone and bricks are often mingled in one wall with an occasional addition of tiles and lime concrete. The want of a proper bond in such cases can be imagined, and the shock to these buildings left them a complete wreck. They probably date from the rebuilding after the earthquake of 1783. The mistake should be carefully guarded against on this occasion, although the way in which material is being sorted over and saved suggests the idea that a repetition may occur.

The houses having basements, and consequently deep foundations, were on the whole found to stand better than those on the surface. This confirms a theory which has been put forward that the earth motion is considerably less at a depth of 10ft., even if it does not entirely disappear, than on the surface. Such an argument favours the construction of deep foundations for at least all substantial buildings, providing that the walls at the ground level are of sufficient thickness to withstand the earth pressure under movement. With isolated buildings, an open foundation could often be arranged by excavating areas round the outer walls, and this procedure would appear to be particularly valuable on soft ground, which carries the earth motion most strongly.

With regard to roofs, much will depend upon the construction of the walls. Whether the earth motion is vertical or horizontal, it must be obvious that the collar or tie beams in a trussed roof are subject to considerably more stress than usual, and these members may therefore be considered as especially liable to failure. If such does occur, the resultant thrust, if not sufficient to overturn a supporting wall, will certainly give aid to any other force tending to act in the same direction. If the bond between the walls is sufficient to withstand this, nevertheless the upper storeys may suffer. Also, if the building has overhanging eaves, the roof covering, say, of tiles or slates, may be shot into the streets; certainly a danger to be avoided. Low pitched or flat roofs are pointed to as meeting the difficulty, with low parapet walls and without overhanging cornices.

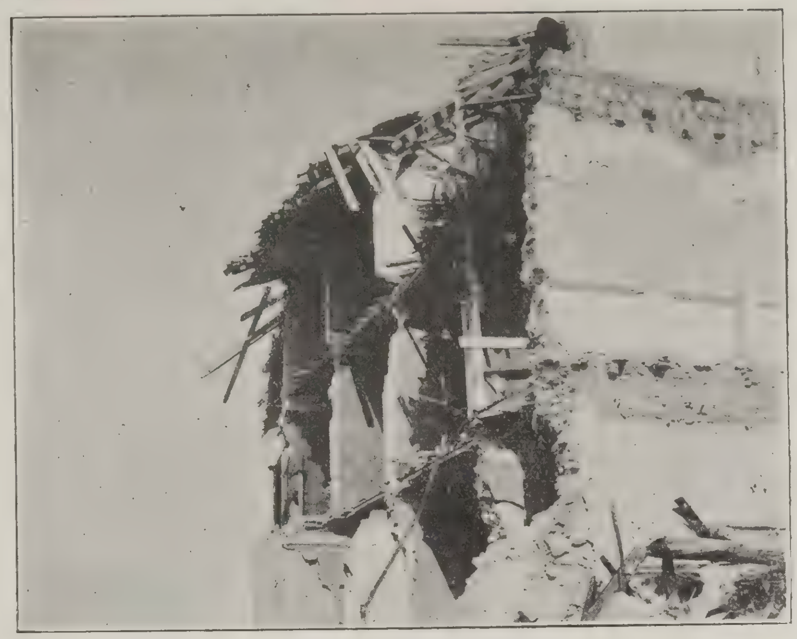

Fig. 2.—Steel Girder Floors at Messina.

The best system of flooring will need some study. Fig. 1 is an illustration of some buildings which have floors built on a method common throughout Italy. Those having a knowledge of the Italian hotels will remember the tiled or mosaic floors with ceilings curved into the walls without cornices. These represent the outward and visible signs of the floors shown on the diagram. The ceilings are practically flat in their centres and curve sharply into the walls. They are or should be built of tiles on edge, with the spandrils filled in with cement concrete and laid with any suitable material to form floors.

In many instances this type of floor was noticed to stand well, even after, as in the photo shown, the external wall had fallen out. Given an immovable abutment, which would depend upon the rigidity of the wall, it is difficult to see how such a floor would fail, sound material and workmanship being granted. Steel joists, well supported or fixed at each end, would probably answer (Fig. 2) in like manner, but should carry a fireproof floor in case of an outbreak. Timber floors for this reason should be tabooed.

It will be seen that the stability of both floors and roofs depends largely upon the walls supporting them. With many of the larger buildings having external walls of considerable strength, these were found to stand, although the interior was gutted. The conclusion is suggested from this that the external walls moved sufficiently to dislodge the bearings of the carrying members of the carcase. It is improbable that the shock caused these to fracture before dislodgement; it is more likely that the reverse took place. From this it should be gathered as imperative that the bond in the building should be sufficient to prevent any inclosing or outward movement of the walls. A reinforced concrete structure would appear to be indicated as most likely to meet the requirements. Steel construction has been used for similar purposes, but would be liable to shed its skin under shock. With a monolithic erection this danger would be obviated. For small buildings, well bonded bricks with steel tie rods and braces should be sufficient. In any case height should be avoided, the buildings to be as squatty as possible. Reference has been made to the danger of openings in the external walls being immediately above each other. This idea can be carried still further. With external walls well tied and bonded, the inner walls might at first sight be considered safe. They probably could be if they continued in one line from exterior to exterior, as in the case of party walls, but where this is not so an inward stress acting upon them from an outer wall might cause disaster. Such walls should be as light as possible, and have no share in the structural stresses of the whole. They should be mere partitions. Another structural defect was noticed—one which probably accounts for many front walls falling out where the rest of the building stood, although badly shaken. It is common in Italy for the rooms in the front of the house to have intercommunication without the necessity of using the corridor or passage. The doorways are generally placed close to the external walls (see Fig. 3), and are, of course, often carried up from floor to floor, immediately above each other. It must be evident that in such cases the bond which should exist between the outer and inner walls is seriously interfered with and broken into small sections. If these doorways are necessary, they should be kept well back towards the centre of the building (Fig. 4), or special means taken to increase the tie above the door heads. This defect can be seen to exist in both Figs. 1 and 2. In the top right-hand corner of Fig. 1 the door itself is seen in position.

It is difficult to decide in favour of a particular method of forming window and door openings. In many cases the skew-back arch seemed to have stood the shock successfully, but agreement may at once be made with Professor Milne as to the danger of an angle being left with arched construction.

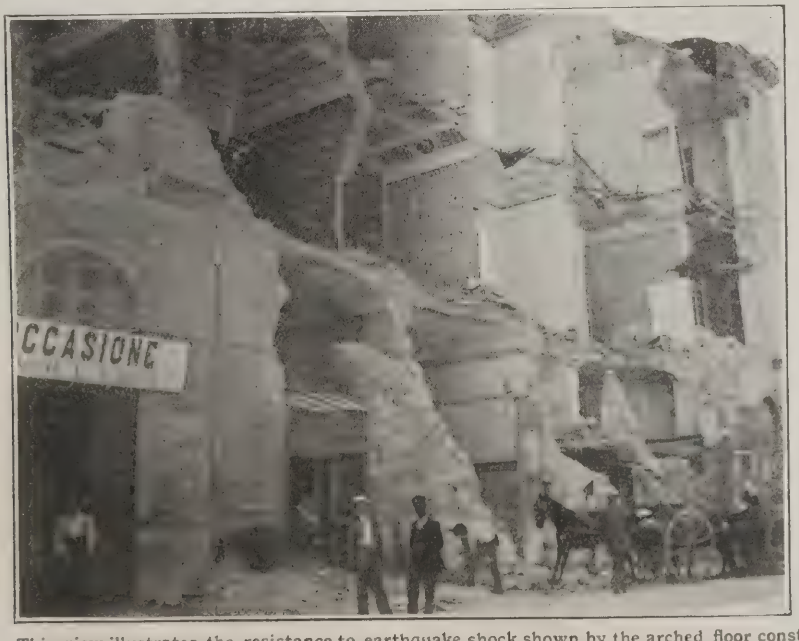

Fig. 1.—This view illustrates the resistance to earthquake shock shown by the arched floor construction common throughout Italy.

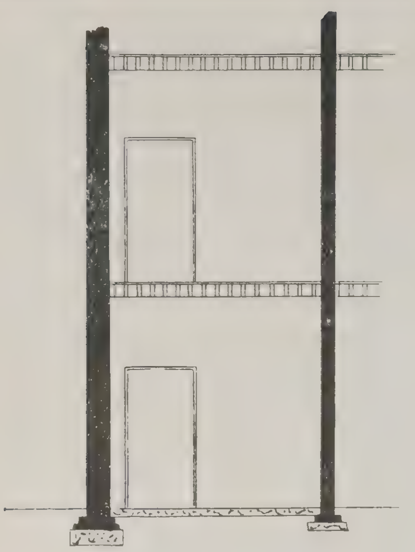

Fig. 3.

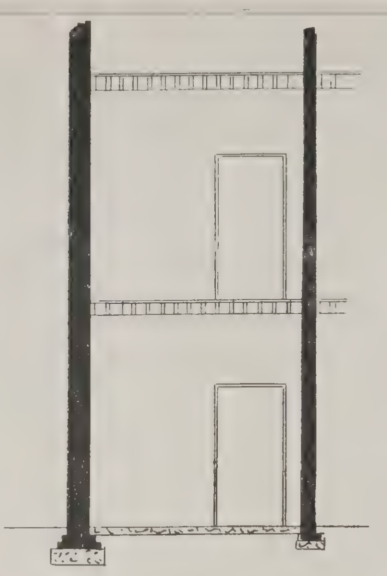

Fig. 4.

Fig. 3 indicates a common form of defect in construction at Messina, the doorways in internal walls being placed close to the outer wall. Owing to the poor tie with the outer walls the latter peeled off the buildings.

Fig. 4 shows how by planning the doorways differently a better bond would be effected between the outer and cross walls.

Particular attention was paid to semi-circular arches over openings. An extraordinary ruin is shown in Fig. 5. Two arches are shown, and the abutments of two others, all in fairly good condition, the superstructure being entirely demolished. It is doubtful if any other form of construction would have remained so stable. They must have been well tested, as being at angles to each other, the earth wave must have affected each differently. Fig. 6 shows some arches at the Post Office. In this case some are at right angles to those shown, the springing of which from the piers can be seen entirely collapsed. Others are to be seen in good order, although the superstructure over the main opening has fallen. So far as could be gathered, it would be fairly safe to use the skew-back in narrow openings with a semi-circular head for those wider.

With reference to iron structures, note was made of several light roofs in the quay side. One, some 60 or 70ft. in length and 40ft. in width, was supported on one side by a wall and the other by columns. It stood well, the flexibility of the structure no doubt proving to its advantage. Several others, similarly constructed, were not in such good order. The wall, however, in these cases had given way causing destruction. How far flexibility as opposed to rigidity can be depended upon for safety, it is difficult to say. Slight structures, such as the statue of Neptune, on the quay side, remained undamaged, but the fountain opposite the Prefecture (Fig. 7) had the upper portion shaken off. This latter photo shows one corner of the Cathedral.

The interior of the Cathedral shows forcibly the damage that can be done by a falling roof.

Heavy buildings, such as the walls of the fort (Cittadella), suffered damage, but chiefly by subsidence. Their slight batter no doubt added to the strength, and this point might be worth further consideration in the erection of large and weighty structures. Buttresses might also be useful at times, and might take the appearance so frequently shown in what are known as Voisey designs.

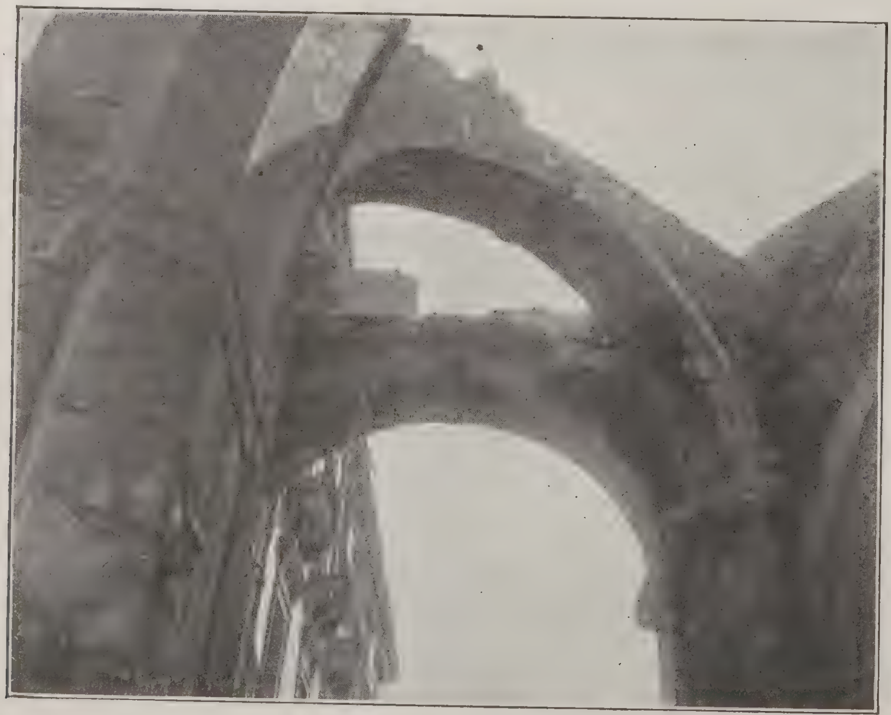

Fig. 5.—A striking view showing the great stability of arched construction.

A system of particularly light construction was seen in the rebuilding of some portions of the railway station. The framework was of wood covered with expanded metal and plastered. In cases where danger from fire was at a minimum such treatment should answer well.

These notes hardly require a summary. They would not be wholly applicable to any one building. A commission appointed by the Italian Government has closely examined the whole of the ruins, and no doubt their report will add to the comparatively slight knowledge obtainable on this subject.

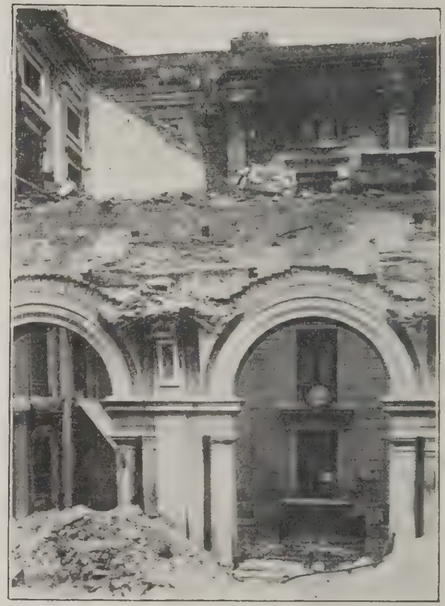

Fig. 6.—Arches at the Post Office.

Our Plate.

This week we show interior views of four of Wren's City Churches—St. Bride's, Fleet Street, St. Swithin's, Cannon Street, St. Mildred's, Bread Street, and St. Mary Abchurch, Abchurch Lane. Not merely for beauty of detail do Wren's City Churches make their appeal to architects, but in the very skilful planning by which awkward sites were contrived to afford dignified and symmetrical interiors.

Mr. Henry Bayly Garling, Fellow of the Royal Institute of British Architects, died on December 4th, at his residence, 25, Clifton Crescent, Folkestone. Born in London in 1822, Mr. Garling was educated at King's College, London. He adopted his father's profession of architect, and whilst a student of the Royal Academy in 1842, he gained the silver medal for measured drawings, and in the following year the gold medal for a design for a Royal Academy of Music. In 1874 he gained the gold medal of the Royal Institute of British Architects for an essay upon sculpture and sculptured ornament. In 1848 he became a Fellow of the Institute, and began to practise, and in 1857 he won in competition the first premium of £800 for the best design for the new War Office, a design which he was never called upon to execute. Lord Palmerston later endeavoured to secure his employment upon the new Foreign Office, but the work was ultimately entrusted to Sir Gilbert Scott. In 1866 he was chosen one of 11 competitors for the new Law Courts, the final choice resting upon Mr. G. E. Street, who carried out the work. Mr. Garling retired from active practice in 1879, and took up his residence at Folkestone, devoting much of his time to landscape painting. He was a great traveller and a great reader, and retained his great intellectual gifts to the close of a long and useful life of nearly 88 years.

MR. RAYMOND UNWIN ON TOWN PLANNING.*

For the last generation or two, in this country at any rate, the architect has centred his thought upon the individual building which he was commissioned to design, and his total inability to influence the surroundings has led him to a large extent to ignore them. The Town Planning movement, culminating, as it has just done, in the passing of an Act conferring powers upon municipal bodies to lay out the plans of their towns in advance, and to make at any rate a beginning of treating their towns as large units to be considered as a whole with some foresight, calls upon our profession especially to remember that the whole is greater than the part. We must begin to think in streets, in districts, and in whole cities, and henceforth to regard our buildings not so much as isolated efforts, but as units in a larger whole. Town Planning, though in this country almost an unknown art to-day, has been practised in all ages and in many parts of the world; and town plans, when examined, will be found to show an almost infinite degree of variety and individuality.

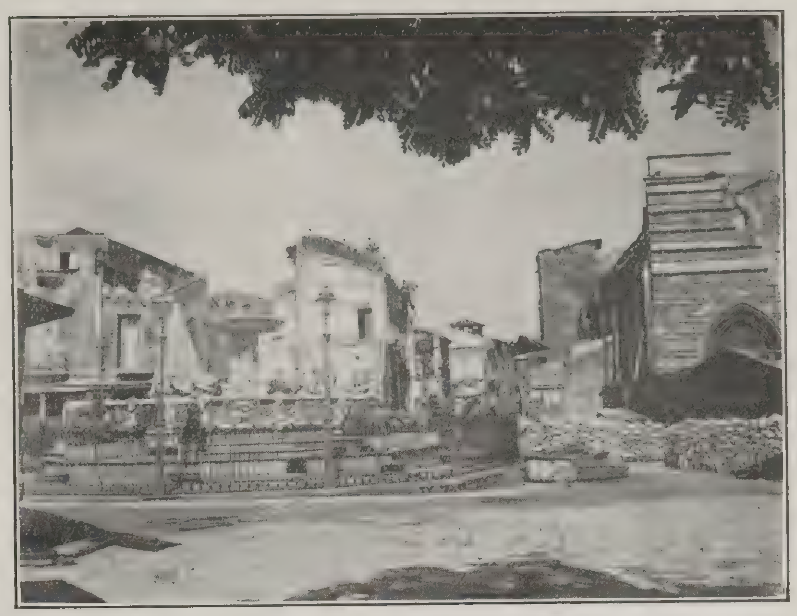

Fig. 7.—Messina Ruins of the Cathedral (on the right), of the Prefecture (on the left), and of the fountain in the City Square (in the foreground).

The Modern Period.

What one may perhaps call the modern period of Town Planning has already passed through several phases of development in other countries, noticeably in Germany, where during the last fifty years there have been developed different styles, characteristic of different periods, showing a growth analogous to the different styles and periods we are familiar with in architecture. As an example of the earlier style as applied to an entirely new town, the plan of Dalny shows evidence of a study of some of the exercises in ideal Town Planning, such as those of Vasari il Giovane and Scamozzi, at the end of the sixteenth century, or of Roland Levirloys at the end of the eighteenth century, with the irregular geometrical plans characteristic alike of Haussmann's work in Paris, and of the German work in the middle of the nineteenth century. This plan is of special interest, as showing the care that was taken in surveying the ground before the plan was made; not only do we find careful contour levels, but also wind and weather diagrams, the prevailing winds and the aspects having both been taken into account in determining the direction of the main roads.

Extension Planning.

In the plan of Cologne, we see town planning applied to the more common case of the extension of an existing town. This plan illustrates also the change in the character of German town planning. In the centre may be seen the irregular street lines, characteristic of mediæval towns, with a few more modern roads resulting from improvement schemes. In the zone immediately outside this area, which was set at liberty by the extension of the fortification lines during the last century, we see the geometrical type of planning, very like much of that which can be found on the plan of Paris. Cologne has again outgrown its line of fortifications, and, moreover, the change in the character of warfare has rendered them obsolete, and the town is now developing suburbs all round. These are being planned by the municipality far ahead of the development, but the geometrical pattern work has been displaced by more flowing lines, showing a marked reaction from the rigidity of the former manner. This may fairly be taken to indicate the intermediate German style and period of German town-planning work. It is very interesting to compare the old plan of Paris with the modern plan, and to see the extent to which Haussmann's geometrical planning has displaced the mediæval irregular street lines of which Paris once entirely consisted.

The Irregular Style.

The influence of Camillo Sitte in Germany, Austria, and the central European countries generally, has resulted in a further development of the curvilinear and irregular style. He advocated a careful study of mediæval town plans, and put forward the theory that these plans were the result of conscious design on the part of a people thoroughly imbued with artistic instinct and tradition; and

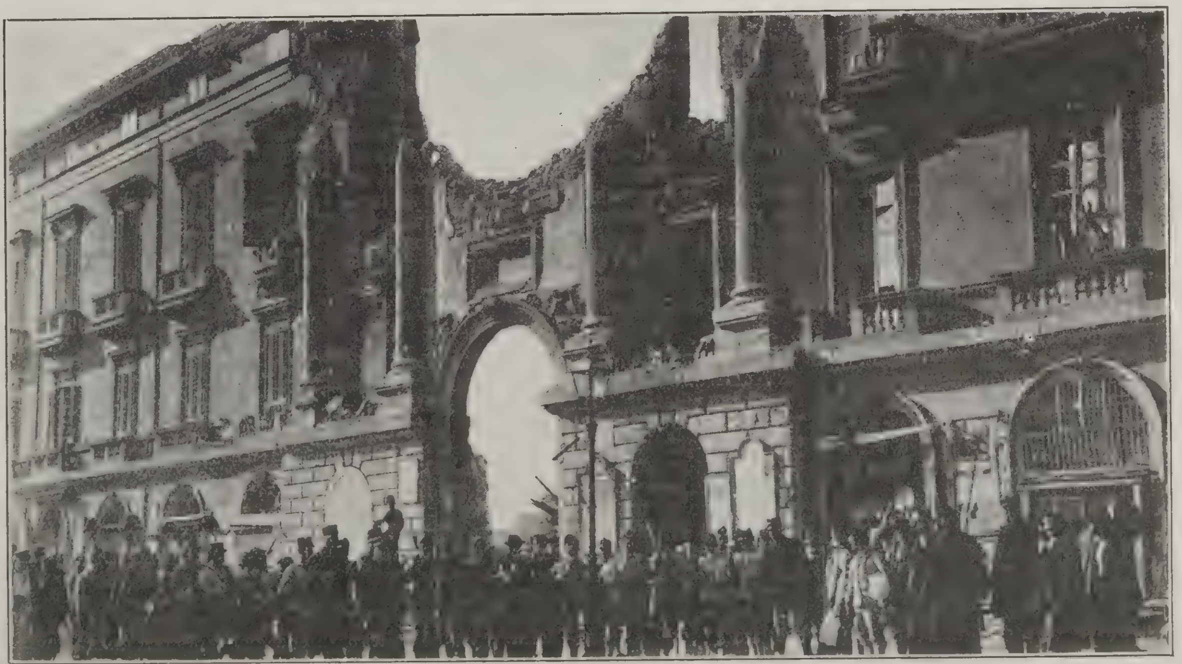

Fig. 8.—Messina: In the ruined buildings on the quay-side an effect the exact opposite to that shown in Figs. 1 and 2 is to be noted. Here the substantial facade wall has stood for the most part, and the poorly constructed building behind has collapsed.

---

* Abstract of a paper read by Mr. Raymond Unwin, M.S.A., before the Society of Architects on December 9th.

he deduced some rules and many suggestions as to the causes of the wonderful picturesqueness of mediæval towns and cities. The plan for the extension of the little town of Kufstein is one of the best examples I know of the most modern style of German work in which the town planner concentrates his main attention on the building up of picturesque street pictures. Every street, every junction, and indeed, one may say every view in this plan has been carefully thought out, so that when the buildings arise on the building lines laid down, they may group together in the picturesque manner characteristic of mediæval cities. It will be found also, that although in no direction are there long, unbroken streets, nevertheless, the lines of the roads are so contrived that it is possible to get about the town in all directions, without inconvenience. At the same time, it would not be very easy to plan an extensive tramway system for such a town.

The plan of Marienburg is a very good example of a combination of the two styles of planning. We see certain straight thoroughfares giving a sense of framework to the town plan, while the details are filled in with the irregular streets, planned to produce picturesque groups of buildings so characteristic of the modern German school.

England's Task.

Signs are not wanting that there will shortly be in Germany considerable reaction against the extreme irregularity, and the excessive striving after the picturesque which has marked their recent work. Here in England, we are about to take up this new art of town design. It behoves us to study very carefully all that has been done before. We have the great advantage of being able, if we will, to profit by the extensive experiments in different styles of work that have been carried out on the Continent during the last fifty years. We have in this country scraps of two traditions in town planning. There is the very regular and symmetrical work characteristic of the Renaissance period, when, for a while, large schemes were grasped and sometimes carried out, as we may see in many parts of London, notably, in the squares lying between Holborn and the Euston Road, and in part of the district round Regent's Park. In addition, we find in Bournemouth, Buxton, Eastbourne, and some other towns that have grown up mainly on the property of one great landowner, town plans worked out under the influence of the landscape school of gardeners, consisting of flowing so-called natural lines, but generally speaking lacking in any large grasp or any sense of wholeness in the completed plan. I think it is of the greatest importance that we should, in this country, not make up our minds too hurriedly, as to one style or the other, until we have pretty thoroughly grasped the advantages of both, and the reasons which have led to the adoption of one or the other. I cannot help thinking that we have here, as so often, the elements of a new synthesis, and hoping that it may be within our power to evolve in this country a style of town planning which shall show alike a due appreciation of the beauties of our usually irregular and undulating sites, and of that other beauty which springs from ordered and regular design. The problem before us really is how to weld together into one harmonious whole the undulating surface and irregular features of our country and the definite lines and ordered arrangement characteristic of good design. And, with a view to further illustrating this, I would like to contrast for you two cities.

The Peasants' City.

The first is the peasants' city of Rothenburg, a unique example of unspoiled mediæval picturesqueness, the character of which springs not from the possession of supremely beautiful buildings, but from the fact that in the whole of the town there is hardly one that does not show a simple comely beauty. The plan is interesting as showing how the form of the town has been influenced by the nature of the ground, the line along the west side following the crest of the high ground on the edge of the deep ravine, which has been worn out by the winding Tauber, a small river, the musical murmuring of which, as heard all along this side of the town on a quiet evening, adds not a little to the charm of the place. It is a characteristic mediæval plan, marked by an entire want of symmetry and regularity, subordinated to the double line of fortifications, one dating from the thirteenth and the other from the fourteenth century, beyond the outline of which, except for a small settlement adjacent to the railway station, the town has never developed. But, while lacking that symmetry and order which go to make up a pattern on paper, none the less this plan has in it many of the far more important elements of a good town design. It has, in a marked degree, both scale and framework. Its market place, with the group of smaller places linking it up with the great church, the rathhaus, and the Herrngasse, the great street in which the patricians of the town once lived, form together a centre finely dominating the town, while the roads leading to the main gateways are also marked out in importance by their comparative width and directness. I must not omit to mention the delightful absence of that region of untidy allotments, derelict building sites, and rubbish heaps which form a girdle round nearly all our growing towns to-day; the way in which the unspoilt country comes right up to the wall of the town, inside which the crowded—I must admit, in many cases overcrowded—city commences, has a very fine effect, and one which suggests to us whether there may not be found for our modern suburbs some means of defining and limiting their areas adapted to our modern conditions of life as the town wall was adapted to those of our forefathers.

Before passing from this beautiful little city, which, more than any other I know, carries one back to the time when all building work was governed by a simple instinctively appreciated tradition which seems to have made it as natural to build beautifully as our modern life has seemed at times to make it natural to do the reverse, I would like to emphasise the unity of effect which has resulted from the following of that tradition. Almost every building in the town, including the Rathhaus and the church, is roofed with the beautiful hand-made Rothenburg tile of a quiet brown colour, here and there brightened with touches of brilliant red where the tile has cleansed itself, as such tiles will. The buildings are either built of stone the prevailing tones of which are cream and light brown, or more frequently are plastered and treated with lime-wash of very similar tones. Bits of bright green and grey occur in the woodwork, the whole producing a unity of effect which is quite astonishing to anybody accustomed to the hopeless jumble of materials, colours, styles and forms which characterise the modern town or suburb. And yet there is no lack of variety, for while the general form of the town, the multiple gables and picturesque groups of turrets and pinnacles give it an essentially Gothic character, much of the detail is distinctly Renaissance.

The Ducal City.

Let us contrast with Rothenburg the city of Karlsruhe, which owes its origin to the Margrave Charles William of Baden-Durlach, who transferred his residence thither in 1715, at which date the plan of the town was made. It is now the capital of the Grand Duchy of Baden, and the Ducal Palace forms the central feature of the town. A tower built out on a wing stands on the centre point from which a series of streets radiate to all parts of the town, so planned that this tower is the terminal feature in one direction along all these streets. On the other side, there is an extensive forest, through which straight alleys have been cut, radiating from this tower in like manner. The Market Place is formed on the axis line of the town, which coincides with the central radiating street. Before the Schloss is a large fan-shaped garden place, having the front of the Schloss at the apex with stable buildings, barracks, residences, and a theatre, forming the radiating flanks, while round the circular arc is built up a colonnaded crescent of houses, cut at intervals by the narrow radiating streets. Beyond this crescent, a circular road links up all the radiating streets, while at right-angles to the axial line at the north end of the market place runs a wide straight thoroughfare from east to west, connecting with various diagonal streets, and completing the general framework of the town. This road leads directly to the district of Muhlburg, and to the docks of Rheinhafen, which puts the town in communication with the much used water course of the Rhine. Sufficient of the early eighteenth century buildings remain to enable one to form a fairly good idea of the effect that would have been produced if the town had been entirely built up at that period. It would be difficult to imagine a greater contrast than that between the style of this town and that of Rothenburg. The straight, formal lines of the streets, the geometrically shaped places, the axial treatment of the market place, the regular, horizontal sky lines, and the entire absence of gables, with the symmetrical and regular treatment of the facades, all emphasise this difference, and yet there is the same feeling of unity of effect, the same sense of scale and framework leading up to a definite town centre that marked the more picturesque and irregular Rothenburg.

Much skill was shown in the treatment of the many acute and obtuse angled corner buildings, a very good effect being frequently obtained by very simple means. We cannot fail to notice how such a regular treatment suffers when the style is departed from, and buildings of different heights and different characters break in upon the orderly arrangement, and, I think, we should take warning, and before embarking upon any system which depends for its success on the complete maintenance of very regular lines, make fairly sure that we can see our way to maintain these.

The site of Karlsruhe is a level plain, having apparently nothing of natural undulation or feature within the area of the town, which needed to be much considered by the planner, so that probably in this case the unusual degree of formality of treatment was justified by the conditions. The faults of the plan are the excessive and monotonous insistence of the somewhat uninteresting tower of the Schloss, the large number of acute angled corners and the uncomfortable shape of many of the places, road junctions, and building plots formed.

Its virtues are the definite leading up to a centre, and the interest which each part derives from being a portion of a definite scheme, the easy communication from point to point, and the simplicity of the general framework, which is easily grasped.

Bearing in mind the comparison we have made of the formal eighteenth century city with the informal fourteenth century one, let us pass to consider in greater detail some of the component parts. We have seen that both plans are alike characterised by an extensive use of places of various sizes and forms. The special characteristic of the mediæval place is the sense of enclosure and the completed frame of buildings which is produced; the shape is indefinite. In the market place at Nuremburg, for example, although at first sight there appear to be many roads leading in to the place, and forming breaks in the buildings, it is remarkable how the arrangement of these does, in reality, leave the framework of buildings unbroken. Either the roads are curved slightly after they leave the Square, or their direction is broken, or they are made to pass out at right angles to the line of vision, so that it would hardly be possible to stand in any part of the Square and get a long, unbroken vista out of it. Contrast with this the modern Max Josef Platz, Munich, where the long straight vista at the side of the Theatre breaks up the frame buildings and gradually destroys any sense of enclosure in this part of the place. The

Piazza del Campo at Sienna is another instance of a place of quite irregular form on plan, in which, so far as its shape and arrangement are the result of conscious design, the aim appears to have been mainly to secure the sense of enclosure, and an unbroken frame of buildings. This, of course, was easy with the narrow streets common in mediæval times, in which a very slight deviation from the straight line is enough to close the vista. The market place at Stuttgart is an example of this. We have only to imagine two modern 50ft. streets replacing the narrow ones actually existing to realise how, unless they were very rapidly deviated from the straight, the sense of enclosure in that place would be entirely destroyed.

In Renaissance places, quite different effects were aimed at, regularity and symmetry of shape and architectural treatment are in them the prominent features, and the sense of enclosure is sometimes wanting.

Linking Up Buildings.

The importance of linking up the buildings and producing to some extent a continuity of frame was, however, apparently recognised in the laying out of the fine group of Renaissance places at Nancy. Where the angles or ends would otherwise have been open, they have been to some extent screened by wrought-iron railings, masses of foliage and semicircular loggie or arched gateways. But the importance of enclosure and linking up of the buildings has not always been recognised in the planning of architectural places, particularly those resulting from what I may perhaps call axial treatment. It is not of course the only desirable effect to be produced in a place, but there is a peculiar sense of completeness and unity and a suggestion of quiet and repose which results from this treatment which it is most desirable to maintain in many places. The Amalienborg Platz at Copenhagen is a very fine instance of an architecturally treated place, in which no attempt is made to secure this element of definite enclosure in the place itself. A monument stands on the intersection of the centre lines of the two cross roads, and the four palaces which face diagonally upon the place are each completed by lower wing buildings, affording something of the gateway treatment to the roads themselves, and giving a fine sense of unity to the whole effect. But in reality this place may be regarded rather as the glorified treatment of a street junction than a place in the sense in which we have been using the word hitherto.

Multiple Road Junction.

The Karolinen Platz at Munich is another example of the treatment of a multiple road junction, with a central feature on the axis of the various roads, and with definite architectural treatment of the corners, but lacking any sense of enclosure. In such places one is not tempted to loiter: they are apt to be distinctly draughty. From these, one naturally passes to consider places formed mainly for the purpose of facilitating traffic. Many examples of these may be found in Paris; at points where several roads converge there is usually formed some open space to facilitate the circulation of traffic, and to secure some degree of architectural treatment to the corners of the various streets. The Place de L'Etoile is the largest of these. The whole question of the circulation of traffic, and the best way of reducing the inconvenience which must always arise in busy streets, where several streams of traffic pass in and out or across the main lines, is too large for me to touch upon to-night, and I can only just say, in passing, that there are two widely different views held on the matter. The German school of modern town planners believe that as far as possible multiple road junctions should be avoided, and each branch street is better brought singly into the main street. They consider that many single junctions disturb the flow of traffic less than a fewer number of multiple junctions. On the other hand, the French school of town planners consider it advisable to give long, straight, unbroken streets, converging at certain points where the traffic can rearrange itself all at one point, and pass off in many directions; and in some cases, as in the Place de l'Etoile, it has been suggested that the best way of dealing with the traffic is to keep it always moving round the centre point in one direction, which, although it obliges a certain portion of the traffic to take a rather longer route, avoids the lengthy stoppages of first one stream and then the other, which are otherwise necessary at crowded crossings.

In connection with the new St. Paul's Bridge, which will throw a considerable stream of north and south traffic across the already somewhat congested stream of east to west traffic, at the junction of Newgate Street and Cheapside, the authorities should consider whether it would not be worth while to test the circulatory system here. If it were found possible to open out this corner somewhat, there are the makings of quite a good place, and the lines of three, at any rate, of the roads, and of a fourth behind the Post Office, if this could be opened up, would strike the place like the arms of a turbine, which would render the circulating system peculiarly easy. A carefully made test as to the usefulness of the system would be very valuable at this moment, when we are about to enter upon a town planning period in this country.

The Garden Place.

But not the least interesting type of place is one which we may call the garden place, because it is the one which is likely perhaps to be of most use to us in the planning of town extensions, the part of town planning for which alone powers are given under the new Town Planning Act.

The Schloss Platz, Stuttgart, may be taken as a good example of this type, and, in passing, we may use the example also to indicate in some degree the style of garden treatment suitable to places. I am convinced that the breaking up of places with architectural balustrades, fountains, bandstands, etc., in the great majority of cases is a mistake. Such features have their place, but they should never be allowed to interfere with the general breadth and simplicity of effect which is so necessary, and which forms so much more dignified a foreground for the buildings surrounding the place. A plain sweep of grass, crossed perhaps by paved footways where necessary for pedestrians, following the simplest possible lines, with avenues or masses of tree foliage, when properly placed, is generally an effective treatment, and the money spent in so-called architectural embellishments would be usually better devoted to masking one of the street entrances with a gateway arch.

Where there is difference in level in the place, broad terraces with balustraded walls enabling portions of the ground to be levelled, may add greatly to the effect. But, in garden places, as in gardens, it is necessary to be very clear as to the effect that is to be aimed at, and to be very cautious about introducing any mere embellishments which do not form part of a scheme definitely thought out to enhance that particular effect. Indeed, it is not only in the treatment of places, but in the whole work of town planning that we need to guard against being carried away by the prettiness of our paper plan. While the importance of definite design and orderly treatment is undoubtedly great, it is equally true that only by building up in imagination the pictures as they will appear to the beholder walking about in the streets, can we test our different proposals. Very often things which may look simple and uninteresting on paper will be much finer in effect than other arrangements showing a much prettier paper pattern. If I have devoted perhaps an undue proportion of my limited time to the place, it is because I wish to emphasise specially the importance of introducing a sense of scale and proportion in town plans, and because I believe that a wise use of the place will, more than anything else perhaps, help us to do this. We need a centre point to our design, nay, I would rather say we need many centre points; for it is not by jumbling together many materials and styles of building that we shall produce satisfactory variety in the large areas which modern towns cover, but rather by the careful selection of suitable centre points to each town, each district, each parish, and almost to each building site, or estate. Around these centre points the plan may be grouped, in relation to them the roads would be laid out, and the widths and treatment of them to some extent graded. Around them may be gathered the local public buildings. These centre points in turn may become the pride of the inhabitants, and may tend both to give expression to, and to foster local civic spirit and enthusiasm.

For important centres where the scale seems to need something larger than can wisely be adopted for a single place, the useful size of which is limited, within fairly narrow lines, we may well take some suggestion from the groups of places which are characteristic of so many continental towns and which may be planned, as, for example, at Salzburg, so that not only does the group form a much larger whole and afford opportunities for seeing the Cathedral to the best advantage from many points of view, but from no point of view is it seen without its due background and frame, in that naked isolation which we are so apt to choose for our public buildings. In large, gardened places, where the scale of the whole would tend to dwarf the buildings, the judicious use of masses of trees may have much the effect of breaking up the larger places into groups of places, partially enclosed by the mass of foliage, and in this way the proportion between the buildings and this limited place area may be the one that will be felt.

In Salzburg, the places are irregular in shape, but the same principles may govern us in planning regular and architecturally treated places.

For the town square at Letchworth, such an arrangement has been adopted, where a large garden square seemed most appropriate for the centre of a garden city, while groups of smaller places surround the main public buildings, and the streets are arranged to command a view of these. [On the same slide was shown a group of places adopted as the central feature at Hampstead, laid out on formal lines to suit Mr. Lutyens's Renaissance designs for the whole of the buildings.]

Building Up Street Pictures.

Much that has been said of places will apply to streets also. The building up of street pictures is, indeed, a fascinating art, giving scope for endless variety of treatment. When it is desired to provide a route from one point to another, and no obstacle exists, nor do the contours of the ground suggest any deviation, the obvious course would seem to be to adopt the straight line. The advantages of the straight street are that it lends itself to the production of vistas, that where suitable terminal buildings can be provided at distances not too great, these buildings can be very well seen, also the straight street affords convenient building sites, and all the many conduits, tramways, etc., which form part of the engineering work of a modern town street, are more easily laid in straight lines. The disadvantage of the straight street is that it is liable to become monotonous. The Rue Soufflot, in Paris, leading up to the Pantheon, is a good example, in which the terminal feature is of sufficient importance and interest. The length of the street is not very great, and the whole forms a dignified and beautiful street picture. But where a considerable terminal feature is lacking, and where the length of the street is great, the long converging lines of windows, cornices, etc., become not only uninteresting, but wearisome. When looking down a straight street, the buildings on either side for a short distance are seen at a sufficient angle for the features to be appreciated, and to be interesting; but very soon, owing to the acuteness of the angle of vision, all the features, such as windows and doors, cease to be seen sufficiently clearly to have any interest, and become mere lines of shadow. Where a cross street occurs, a small portion of this vanishing perspective is replaced by part of the side elevation of the corner building furthest from the beholder. A little point of interest is at once introduced. The lecturer showed how this point is emphasised by the different treatment of the two sides of the street, from which it was seen that by a judicious breaking of the building line it is possible to fill the picture with the side elevations of buildings seen nearly square with the line of vision, so that the features are sufficiently well seen to afford interest and variety. In this way, by the introduction of suitable recesses or forecourts, which afford an opportunity for planting trees, it is possible to build up quite interesting and picturesque views on a straight street, and to avoid any large amount of the picture being filled with the converging lines of the vanishing perspective. In the case of suburban roads, where the houses stand far apart in proportion to their height, the street view may with advantage be limited at intervals by bringing some of the buildings close up to the road line, and in this way the street pictures will be greatly improved, not only by the limitation in the distance, but by the framing in of the view.

The advantages of the curved street are that it can be more readily adapted to the usually undulating surface of our site, and that there naturally springs up along it an every varying street picture.

[The lecturer illustrated his remarks by passing through the lantern a series of slides of the famous Oxford High Street, beginning from Magdalen Bridge, and terminating with the fine treatment of the Cartax Corner, carried out by Mr. Hare, when the increasing traffic necessitated the removal of the nave of the Church.]

It was to be clearly seen from these pictures how the concave side of the street is the one that chiefly adds interest and variety to the picture, and the curved street is apt to lose on its convex side in proportion to the gain on the concave. If we examine a view of the Regent Street Quadrant, we shall see how rapidly the convex side of the street vanishes out of the picture. Comparing this with the concave side, the buildings on this side of the street are seen at a sufficiently wide angle for the interest of the features to be maintained right up to the vanishing point, and we may also judge of the fine effect which may be produced by a continuous horizontal treatment of a fairly regular curve. But it must not be supposed that a beautiful result necessarily follows from a curved street. There must be sufficient unity of effect and emphasis at the right points. Let me contrast a view of Holborn looking eastward, where we have a jumble of unrelated buildings and the minimum of unity, and where the curve of the street in the distance is marked by no feature of sufficient scale or interest to dominate the picture, with the Karolinen Strasse in Augsburg, where with much true variety of treatment in the buildings, a very much greater unity of effect in attained, and where the Perlach Tower and the Rathhaus beyond form a dominating feature just at the right point in the view.

I think we may say, then, that there is ample place in our town plans both for curved and straight streets, but their use should be governed by some definite purpose, and some definite effect in each should be aimed at, so that we may neither carelessly continue our straight lines regardless of contours, nor imagine that we shall get a good effect by adopting aimless wiggles, merely for the purpose of avoiding straightness.

In the actual planning of our roads and streets, we cannot think only of the architectural effect to be produced. Rather, we must first think of the utilitarian purpose that the street has to serve, and find in each case such a treatment as will within the prescribed limits afford an opportunity for beautiful architectural expression of these particular requirements. While working on paper we must always be thinking in the solid, for it is the massing and grouping of the buildings which we see and which effect

our picture much more than the actual street lines; and it may often be possible to adopt quite independent lines for the buildings from those which are necessary for the road lines of the street. So important is it to consider the grouping of the buildings that after having determined in a general way the directions which roads must take to provide the necessary facilities for traffic, and to satisfy the engineering requirements, it will usually be found helpful to block out the design in buildings rather than in road lines, because within the very often fairly wide limits which would satisfy the practical requirements, the exact form may be determined wholly on architectural grounds. On residential roads much greater freedom of treatment is possible than in those solidly built up, and particularly those devoted to shopping and other business purposes, and in residential roads we encounter new difficulties, partly owing to the great width between the buildings, and partly owing to the tendency to employ detached or semi-detached units, each different from the others, producing a generally scattered effect in the areas devoted to larger houses, and to the equally monotonous plan of building long rows of smaller houses, all alike, and all alike uninteresting, in the streets devoted to smaller dwellings.

Under the new Town Planning Act, it is in the ever-growing residential areas around our towns that the chief opportunity will be afforded. Centres of considerable magnitude and having buildings of fair importance will need to be provided, where whole new suburbs are growing up on the outskirts of towns; and to these the principles which we have been gleaning from the examples of different styles and periods will be as applicable as they are to those central portions of towns which are not affected by the new Act. But in all streets alike, whether residential or otherwise, we need to consider the total effect first, and the individual buildings as units contributing to that total effect. Much may be done by the careful designing of the building line to give to each street some definite character and unity, and this may be further emphasised by the adoption of definite building materials for definite streets or areas, a common roofing material being of itself enough to give a considerable degree of unity to a district. In the planting of streets also additional emphasis can be laid on the particular treatment adopted.

The tendency, which is becoming so marked, for areas to be developed by enlightened Garden Suburb Trusts, or by Co-partnership Societies, will afford opportunity for a greater degree of grouping of buildings. In streets of cottages and small villas one of the difficulties arises from the fact that the unit is so small and becomes so wearisome owing to the degree of repetition. A great improvement can be made where, instead of rows of houses all alike, a number can be designed as a definite group, and this may be carried further, and three or more of such groups may be designed so that they form together a still larger group. Thus, it becomes possible within limits easily practicable to create units in the street of sufficient size and importance to dominate the picture, although still composed of individual cottages each complete in itself, and with comparatively little variation in the plan and general arrangement.

With what a sense of pleasure and relief anyone wandering among the dreary ugliness that abounds in the neighbourhood of Southwark Street, comes suddenly upon the little group of almshouses at the corner of Holland Street. These are as simple almost as the cheapest rows of cottages built, as they are of London stocks, relieved only by coigns; but it is the grouping of these almshouses around the simple grass court which takes approximately a cruciform shape that is so pleasing and affords such a contrast to the surrounding rows. Surely, we may from such groups of tenements as these derive much suggestion for the treatment of residential buildings and roads. In these days, when the main thoroughfares are rendered dusty, noisy, and smelly by much motor traffic, it is eminently desirable that houses should be built just off the main street, and deriving inspiration from our college quadrangles, the groups of almshouses, or the closes of cathedral cities we may, I think, add greatly to the pleasure of life in our suburbs, and to the interest of our suburban roads.

Co-operative City Building.

I want to suggest to you that fine city building which is, after all, the end and aim of the art of town planning, is essentially a co-operative art, and, indeed, I believe the art of architecture itself is very much more a co-operative art than many people seem to think. It is more and more necessary to bring to bear upon even our individual buildings types of skill and ability seldom all united in one man, and our offices are really much in the nature of guilds turning out work which is the result of a high degree of co-operation between the principal and the assistants working with him. In the same manner, fine city building can only result from a high degree of co-operation between all the architects working on the individual buildings. Something may be done on limited areas and on private estates, as at Bedford Park or Hampstead, for example, to produce unity of effect by bringing all the buildings under the controlling influence of the ideas of one man, whose attention is centred on the whole effect, rather than on the individual buildings; but these are, after all, makeshift methods. Art is not a thing easily to be controlled, and unity of effect in a whole town can only be expected when the whole of its architects are joined together by some common aim, some common appreciation of the whole effect which is being worked up to. This may seem much to expect from the present chaotic and individualistic condition of the architectural profession; but I cannot help hoping that the opportunities afforded almost for the first time in this country by the Town Planning Act, enabling us to consider as a whole, and to guide and to control the development of our towns along definite and well thought out lines planned with the due consideration for architectural effect, will so stimulate in all of us an enthusiasm for the beauty of the whole, that it will become as natural to think first of the whole, and to see our buildings in the true perspective as parts of a great street picture, as it has been natural under the conditions which have held sway in this country for so many years, for our attention to be concentrated exclusively on our own work. This is the right, the ideal form of compulsion, the compulsion exercised upon each one of us by our zeal for some ideal which shall be shared by the whole guild of architects. We should do all that is possible in our own practice, and in the education of those who are coming forward to help us and take our places in due course, to foster this spirit, because it is only by the development of this compulsion from within that we shall be able to justify ourselves in resisting some form of compulsion from without.

HOUSE AT GERRARD'S CROSS.

This house has been recently built at Gerrard's Cross, Bucks., for T. D. McMeekin, Esq., on an elevated site overlooking the River Colne. The external walls are whitewashed and the roof thatched with Norfolk reeds, by Mr. Farman, of Walsal, Norfolk. The half-timber work is oak, left rough from the saw and with pins projecting. A feature is made of the hall, which is oak panelled to the walls, with a large ingle fireplace, built in Dutch bricks, and old pieces of stone. Heavy oak beams form the ceiling of the dining room, and the two rooms are designed to form one large room when the doors are opened. The staircase is octagonal, and constructed in oak and Oregon pine, the casement windows forming a frieze with rough tile panels at ends, immediately under a domed ceiling. The architect was Mr. A. Jessop Hardwick, F.R.I.B.A., of Eagle Chambers, Kingston-on-Thames, and the contractor Mr. J. Bailey, of Gerrard's Cross. All iron casements and leaded lights are by Messrs. Humphries, Jackson, and Ambler, of London, and the door furniture by Messrs. Hope and Co., whilst the rain-water heads are by the Bromsgrove Guild.

Legal Notes.

Builders and contractors who have to move large quantities of stone and other heavy materials about the country in order to fulfil large contracts, are sometimes accused of causing damage to the roads. The highway authority may recover the cost of making good the damage caused by "extraordinary traffic." Formerly, the person "by" whose order the traffic was led was the person responsible; since 1898, however, the person "by or in consequence of whose order" the damage was caused, may be made party to the action. But what is "extraordinary traffic"? The courts have decided that, in solving the question, regard must be had to the normal traffic of the district. A recent case (which is reported in the November "Law Reports") makes it plain that the nature of the road in question is to be regarded. In that case, the defendants bought standing timber from Lord Penrhyn, which they cut down and led away. Their defence was that timber growing was a recognised industry in the district. It was pointed out, however, that the road in question was a narrow road, generally used only for agricultural traffic, and had steep gradients. Taking this into account, a county court judge held that the traffic was extraordinary so far as the particular road was concerned, and found against the contractors, and his decision was upheld by the Court of Appeal. Builders and others should be careful to select a road which will bear heavy traffic.

Expert Witnesses.

Architects and surveyors often appear in court as expert witnesses. If the expert knows nothing of the party who desires him to give evidence, he will be well advised to demand payment of his fees before he consents to go to court at all. As a general rule, of course, if the party who calls him wins the case, the witness's fees are included in the costs paid by the other side; and sometimes the costs of his attendance to inspect and view the property are also included. In a case which was reported in the November "Law Reports," the question was whether a "qualifying fee" was payable to a geologist. He had been subpœnaed to give evidence as to whether kaolin was a mineral or not, and had visited Cornwall in order to make investigations. Mr. Justice Eve said: "Although I am not for a moment saying it is necessary that every scientific witness called in a case of this sort should view the *locus in quo*, I am perfectly certain the experience of most of us is that a scientific witness, however eminent, is far more useful to those conducting the case if in fact he has had the advantage of viewing the *locus in quo*. . . Here he had had to make a careful examination of the strata." In the event the fee was allowed. Architects and other experts should remember that their qualifying fee may be allowed, and should not therefore hestitate to emphasise the importance of seeing what they are going to give evidence about.

Children and the Law of Negligence.

Every builder and builder's foreman has had trouble with trespassers on the job Sometimes an attempt is made to keep them away by an announcement that "Trespassers will be prosecuted," or that there is "No admittance except on business." Of course, in the case of an adult, he trespasses at his peril. If a brick were to fall on his head, neither the builder nor the building owner would be liable, unless, of course, the act was deliberate, when it might come under the head of an assault. Possible danger, therefore, may act as a deterrent for adults; but this does not protect the builder from infant trespassers. Nor does an infant trespass at his own peril. In a recent case some boys trespassed on the property of a railway company and played with a turntable. In the result one of them was injured. The House of Lords held that the railway company was liable on the ground that a machine of the kind which would attract children must be properly guarded. So if a builder were to leave a crane unguarded, and a child was to be injured by playing with it, the builder would probably be held liable. It is therefore important for children to be kept away from the works at all costs.

Law Cases.

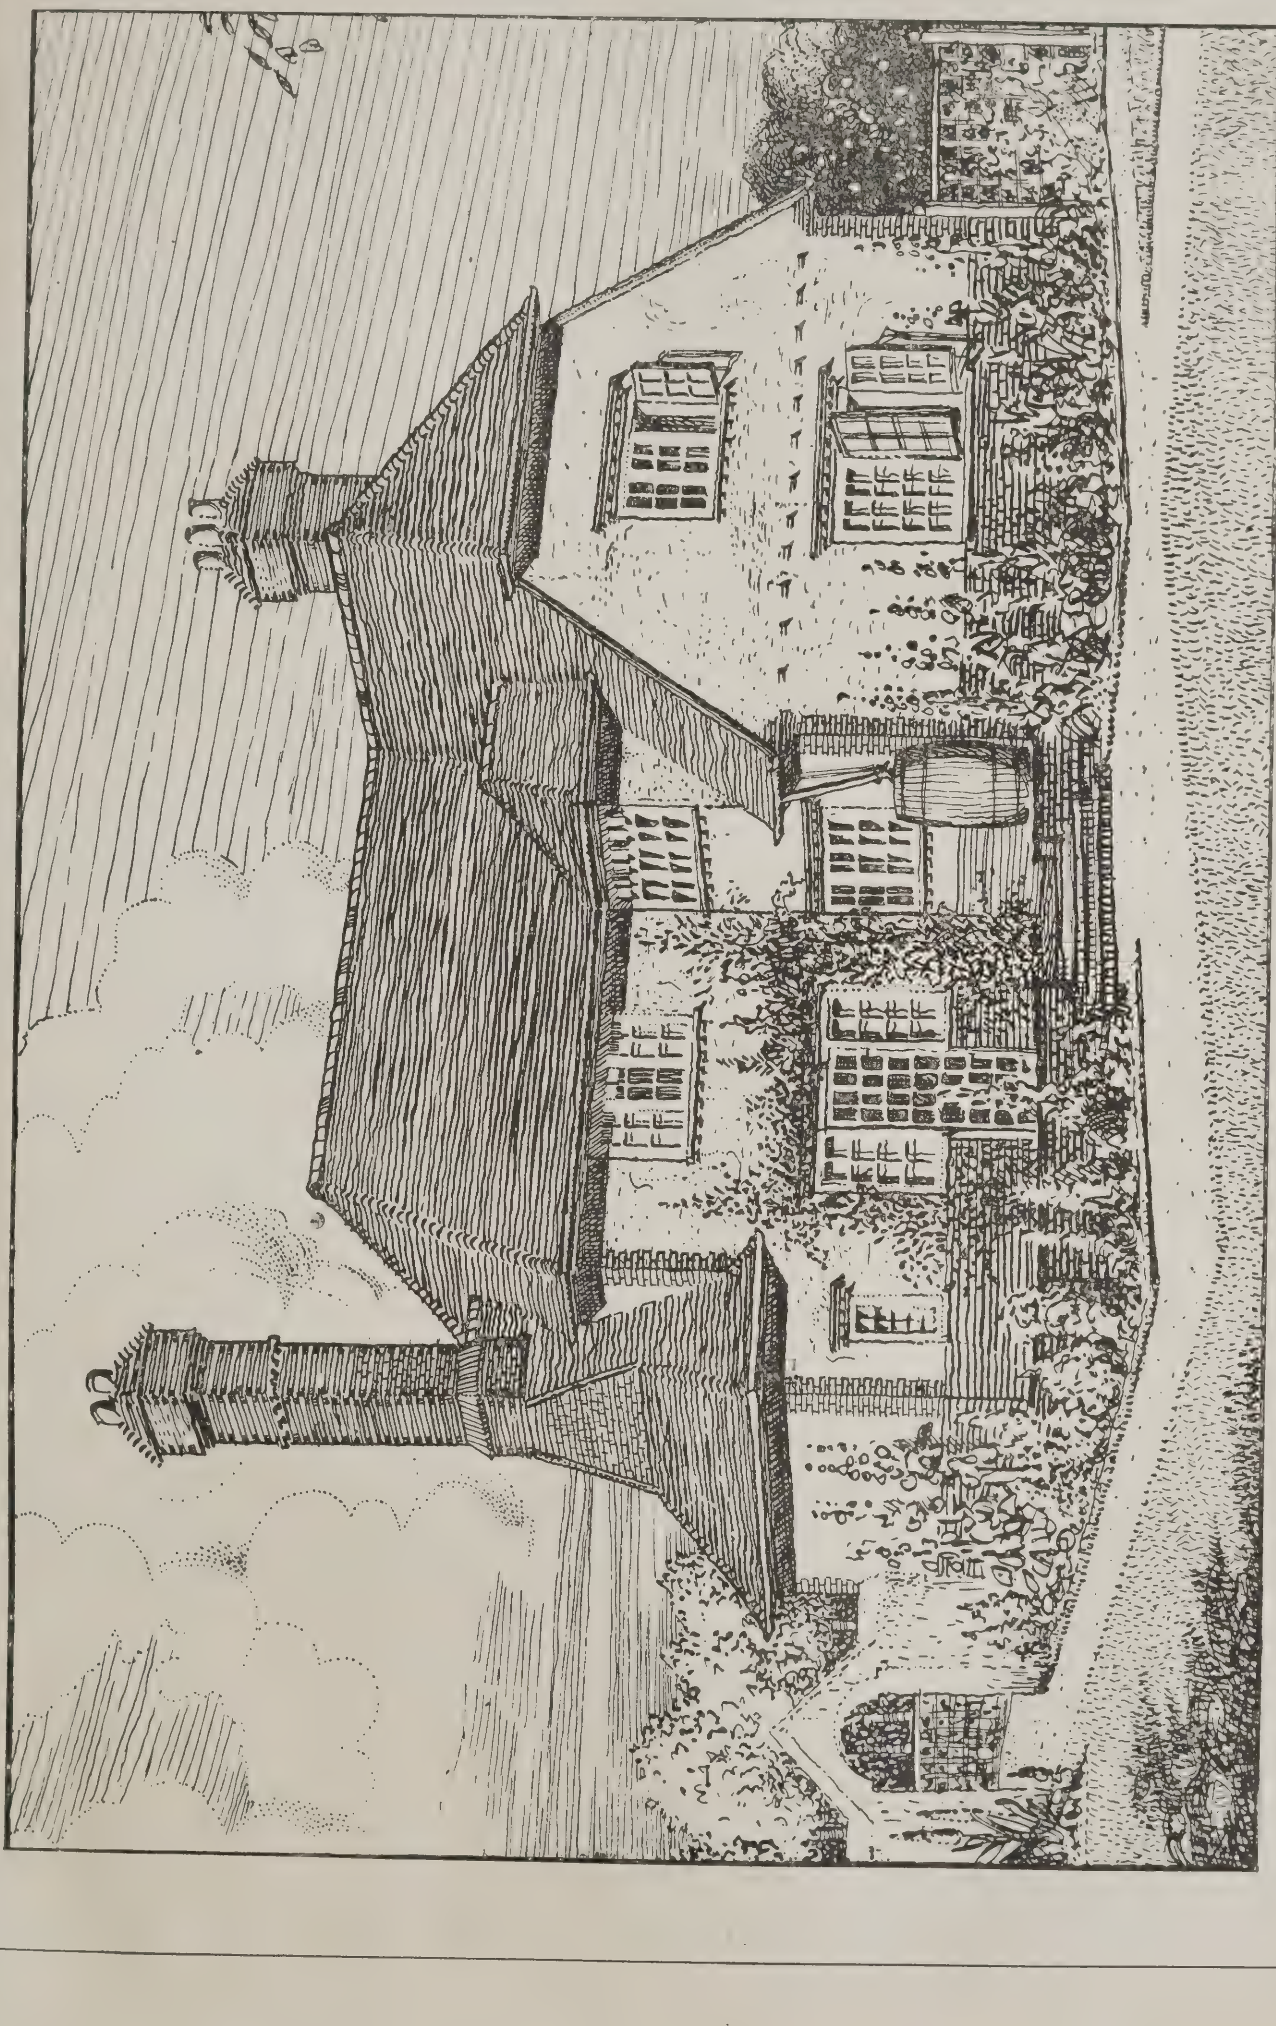
The Composition of Mortar.

At the Portsmouth Borough Police Court, a group of fourteen builders were arraigned upon a charge of contravening a local bylaw as to the composition of the mortar that had been used during the previous June on houses which they had had in course of erection at that time, and the case excited great interest throughout the building trade of the town, the Court being packed by those in the trade who desired to hear the arguments. The by-law in question is by-law 13, which was made on the 12th April, 1904, and which requires the mortar in use to be compounded of "white chalk lime and clean sharp sand or other suitable material in the proportion (by measure) of one part of lime and not more than three parts of sand, or other suitable material; or (b) of good cement; or (c) or of cement mixed with clean sharp sand in the proportion (by measure) of one part good cement, and not more than four parts of clean sharp sand." It was alleged that mortar had been used which did not comply with the requirements of this by-law. The first summons taken was that against William Richard Tanner, in respect of houses in Comeragh Road, Milton. Mr. S. H. Emanuel, LL.D., barrister (instructed by Messrs. Hobbs and Brutton) defended, and Mr. Sparkes, the deputy Town Clerk, prosecuted. Mr. Sparkes said that in this case a sample was taken by a building inspector on the 15th June in the presence of the defendant, and when it came to be analysed, it turned out to be made up of one part lime to 16.3 of sharp sand. Certain formal points having been admitted on the part of the defendant, John Henry Charles Gosling, a building inspector in the employ of the Corporation, spoke to the taking of a sample of the mortar in use on the buildings in question on the 16th of June last. Mr. F. W. F. Arnaud, the borough analyst, gave evidence as to the result of his analysis of the sample taken from the defendant's buildings. He said the result of his analysis was that he found the mortar contained 81.37 of sand and grit, in weight; it contained 12.53 of earthy matter which was not combustible, and .71 of earthy matter which was combustible; the amount of pure lime in the sample was 1.61 per cent. in weight. The conclusion that he arrived at from that analysis was that there was an excessive quantity of earthy matter and that the lime was deficient because calculating that in volume there was not more than one part of good lime to 19.5 of other materials. A Magistrate: What is the proportion of lime to sand and grit?—The proportion of lime to sand and grit, that is, including all earthy matters, is not more than one part of lime to 16.3. Mr. Emanuel then submitted a point of law to the effect that the by-law under which this information had been laid (by-law 13) dealt only with the mortar which had been used in external or enclosing walls. It had nothing whatever to do with the mortar used in party walls, or in inner walls that divided rooms, and therefore mortar of the composition mentioned in this by-law, though wanted for the outside walls, was not wanted for the inner walls that did not enclose the building, and there had been no evidence given that any of it had been used on any enclosing wall, and for all they knew it might all have been used on the inner walls. Therefore, he submitted the information must fail. —The Bench having considered the point raised, the Chairman announced that whilst they were not altogether prepared to agree with Mr. Emanuel's point of law, they were of opinion that in this case, as to the application of the mortar in question, there had not been sufficient evidence, and therefore the case would be dismissed.

The next case taken was that of William T. Bayley, in respect of the mortar alleged to have been used in two houses he was building in Liss Road.—Mr. Gosling, building inspector, said he saw defendant's men using the mortar on party walls, cross walls, division walls, and external walls.—In reply to a cross-examination, he said that since the occurrences which led up to this case, the instructions were to take samples of mortar from between the bricks, and not from the heaps, and the process was as under the Food and Drugs Act, leaving one with the builder that he might have an analysis made in his own defence.—Mr. Murch, the borough surveyor, said proper material for use with lime in mortar was clean, sharp sand; other suitable materials were hard, well-burnt brick, thoroughly ground, or good clinker which came from a destructor; this was very hard when burnt.—Col. Owen: Would it pay to use brick?—It would not pay in small buildings.—Mr. Arnaud gave evidence as to the analysis of the sample, which, he said, contained 80.13 per cent. of sand and grit, 8.22 of incombustible earthy matter, and .77 of combustible earthy matter, making the total earthy matter 8.99, the pure lime being 2.55 per cent. in weight. The lime present was not more than 1 per cent. to 12.1 of other materials. In this case there was an excess of earthy matter, and it was deficient in lime. He was emphatic that his method of dealing with the sample was perfectly fair, but he concurred with expressions of opinion by Mr. W. C. Ball and Mr. Vernon Inkpen, the former suggesting that three samples of 2lb. each, and the latter a half-shovelful should be taken.—Mr. Emanuel, for the defence, submitted that there had been no identification of the sample, and that no case had been made out.—Defendant said he had built hundreds of houses. He used the mortar mixed in the proportions of three to one. The mortar used for inside work was kept separate from that used for the outside work.—In this case, too, the Bench expressed themselves as not being satisfied that the mortar was used on the enclosing walls, and the information was therefore dismissed.—Mr. Emanuel said that he should take the same course in the other cases, but the Bench suggested that they should be adjourned *sine die*.—After some discussion, Mr. Sparkes intimated that the other cases would be withdrawn.—Mr. Emanuel commented on the fact that the method of taking the samples had been altered.

The New General Post Office Buildings.

At the Consistory Court of London, before Dr. Tristram, K.C., Chancellor of the Diocese, sitting in St. Paul's Cathedral, an application by the vicar and the churchwardens of Christ Church, Newgate Street, for the court's approval and ratification of an agreement come to between them and the Postmaster-General in respect of compensation for interference with certain easements of light and air consequent upon the erection of the new Post Office buildings, was heard. —The petition stated that the Postmaster-General has acquired the fee simple of certain land and premises forming part of the site of Christ's Hospital immediately contiguous to Christ Church, Newgate Street, and by the Post Office Sites Act, 1907, he is empowered to erect buildings there. All public and private rights and easements in, over, or relating to the Post Office site are extinguished, but the Act provided that any person might recover from the Postmaster-General such compensation as he might be entitled to under the Lands Clauses Act for any private rights or property of which he might have been deprived. The new building erected by the Post Office was in closer proximity to the church than the buildings which formerly stood there, and they were at a much greater height. A claim for compensation had been made for this interference with the church's easements of light and air. Under the advice of competent architects and surveyors, an agreement had been en-



THE WHITE COTTAGE. J. ALGERNON HALLAM, ARCHITECT.

The above is a sketch for a small cottage, the walls to be covered with rough plaster, the roof with hand-made tiles. When built the first floor will be carried up straight over the living room ingle, this will give space for a fourth room on the bedroom floor, the present large bedroom being made a little smaller. The chimneys are to be constructed of small bricks unpointed.

tered into between the vicar and churchwardens and the Postmaster-General for the settlement of such claim by payment of £1,000, and the Court was now desired to approve and ratify that agreement and to direct the payment of such compensation to the Ecclesiastical Commissioners in order that by its investment the income might accrue for the benefit of the incumbent for the time being. In reply to the Chancellor, Mr. Charles said the sum granted for compensation—£1,000—had been fixed after consultation between Sir Henry Tanner, representing the Post Office, and Mr. Blomfield Jackson, representing the parish. Mr. Opie Smith, on the part of the Post Office, concurred in the petition. The Chancellor said he should make the order as prayed.

Apprenticeship Agreements.

A case of much trade interest came before the Stipendiary Magistrate (Mr. E. M. E. Welby) at the Sheffield Police Court, on Friday last, and occupied the attention of the Court for nearly four hours. The matter had been adjourned on several occasions, owing to the illness of the Stipendiary. The plaintiff was a member of the Sheffield Association (Mr. A. J. Belton), who sought to enforce an apprenticeship agreement entered into with an apprentice named Harold Gosling. Mr. P. Richardson appeared for the plaintiff, and Mr. Arthur Neal defended.—Mr. Richardson said that the boy, who was 16 years of age in November, 1906, became apprenticed to Mr. Belton in June, 1906. Mr. Belton had occasion to remonstrate with him, and to encourage him to give better attention to his work, Mr. Belton increased the lad's wages, so that the lad was receiving altogether 3s. per week more than the agreement stipulated. Mr. Belton, however, was put to much inconvenience by the lad's indifference to his employer's interests. On September 1st this year matters had reached such a pass that Mr. Belton consulted his solicitor, who wrote to the lad's mother to the effect that, although his client was loath to proceed to extreme measures, he would now require the lad to return to work at the wages stipulated by the apprenticeship agreement. As a result, the lad promised to obey if Mr. Belton would still continue the extra money, and this Mr. Belton consented to do. Subsequently Mr. Belton felt it his duty to bring the matter before the Court as a point of principle. On October 1st, the lad left his work absolutely, and had entered the service of another employer. Plaintiff now asked that the lad be ordered to go back and do his duty according to the apprenticeship indenture. Mr. Belton gave evidence in support of the statements of his solicitor.

Four men in the employment of plaintiffs deposed that the lad had been persistently negligent, and had on occasions absented himself as much as four or five hours at a stretch.—The lad Gosling stated in evidence that at first he had received instruction from a man who had been apprenticed with Mr. Belton, but when he left there was no one to teach him. Cross-examined by Mr. Richardson, he would not deny that Mr. Belton had complained personally and by letter, but he had never done work wrong intentionally. Since he left plaintiff, he had been in temporary employ at 5d. per hour, and made perhaps 5s. per week more than he was getting with plaintiff.

The Stipendiary, in delivering judgment, said that this was a case which contained some highly important points, and they had very properly been brought to the notice of the Court. There had been a complaint that the apprentice did not receive sufficient personal superintendence. That was necessary at the outset, but it could not be held that after three years an apprentice was incapable of working to instructions and designs, even if he had not done exactly the same work before. He therefore thought that the complaint about personal superintendence was rather overdrawn. As to the apprentice being taught, cases had come under his notice where it was evidently intended that the master should personally be the teacher. The plaintiff's trade seemed to divide itself into two branches—the shop, and buildings, or outside work. On the former, it did appear that there was some ground of complaint, that there was not a sufficient amount of competent superintendence. So far as the outside work was concerned, it was not disputed that a competent joiner was in charge. But, at any rate, if there was slackness in the teaching, it was for the apprentice to complain to the master that he was not fulfilling his engagement under the apprenticeship deed, in the same way as in the present case the master complained that the apprentice did not fulfil his part of the engagement; and he was bound to come to the conclusion that the apprentice had not done so, and must be ordered to fulfil his duties, because the complaint was that the apprentice worked uncertainly at times, and it was quite evident that he could work properly and industriously, instead of which he had taken two hours over a job requiring only twenty minutes. He was afraid he had got out of liking for his master, like so many apprentices when the time comes that they begin to feel that they can do better out of their apprenticeship, and become slack, with the object of getting the apprenticeship indenture thrown up. What the apprentice had to do was to place himself into a position in which there was no complaint against him, and then if he had a valid complaint against his master of slackness in teaching what he has to be taught, the master must be ordered by the Court to put that right. Under all the circumstances, there must be an order that the apprentice go back and fulfil his duties as a proper apprentice under his apprenticeship agreement.—The plaintiff asked for costs, not necessarily to be enforced, but Mr. Neal, on behalf of defendant, held that it was unusual to award costs against an apprentice, and the Court refused to make an order.

ENGINEERS v. PLUMBERS.

Board of Trade Arbitrator's Award.

The decision of Alderman T. Smith, J.P., the arbitrator appointed by the Board of Trade to determine the question of dispute between the parties has now been issued, and is as follows:—

"I decide that no claim has been established giving to plumbers the exclusive right to fit and fix all pipes and fittings in hard metals used in connection with ventilation, heating, warming, laundry, cooking, and general hot and cold water domestic (or other) supplies or services. I therefore award and determine that, in the water area of the Leicester Corporation, the demarcation of work shall be as follows:—

> (a) "All lead work in connection with hot and cold water domestic (or other) supplies or services, shall be plumbers' work. All domestic waste, soil, or ventilating pipes above ground, from w.c.'s, baths, lavatories, sinks or other sanitary conveniences or appliances, shall be plumbers' work.
>
> (b) "All other work in connection with ventilation, heating, warming, laundry, cooking and general hot and cold water domestic (or other) supplies or services, in which iron, brass, copper, or other similar hard metal is used, may be done either by hot water heating and ventilating engineers, fitters, or by plumbers, as may be provided in plans or schemes prepared by hot water, heating and ventilating engineers, or by master plumbers, or others."

This vindicates the right of the heating and domestic engineers to do the work in question and establishes what they have maintained all along, viz.:—"That all lead work be considered plumbers' work, but that a neutral line be taken as regards all iron, brass, copper or other metal work, which may be executed by engineers or plumbers." The plumbers' contention that, irrespective of the metal used, the work is theirs and theirs alone to the exclusion of any other trade, is thus set aside and disposed of.

NATIONAL LABOUR EXCHANGES AND THE BUILDING TRADES.

(*Communicated.*)

There is probably no industry to which the Labour Exchanges Act, 1909, of more importance than to the building trades, and at the moment when the Board of Trade is preparing the necessary organisation, it will be of interest to consider the workings of the Exchanges as they affect these trades.

As showing the intimate relations likely to exist between the Exchanges and these trades, it may be mentioned that out of 9,642 applicants who came under the notice of the central unemployed body for London during a given period, no less than 1,661, or over 17 per cent. came from the building trades.

As to the Exchanges in general, the country has been divided into ten great districts, varying in size according to population and industrial nature. Each district will have a central office and a divisional superintendent, under whose control will be a number of Exchanges. Each Exchange will work primarily in its own area, and report to its divisional officer. The divisional offices being in constant touch with one another and with the headquarters at the Board of Trade in London, it will be seen that a worker may hope to ascertain promptly and definitely what labour is in demand, not only in his own area, but all over the country, instead of, as at present, being limited to those jobs which he can actually visit, with the addition, perhaps, of a little information passed on to him by his friends.

The Exchanges are to be of three classes, according to the requirements of the various towns and districts, supplemented by a system of sub-offices—practically only waiting-rooms—at prominent resorts of casual labour, such as the docks in London and Liverpool.

The advantages of such Exchanges may be summarised as follows: For casual labour, to "de-casualise" the nature and incidence of such work; and for the skilled worker, to avoid, or at least to shorten, the trying, dangerous, and demoralising breaks between spells of work, by bringing the man and his work together with the least possible delay.

Obviously, a completely successful Exchange will be one in a locality where every worker looks to the Exchange as his source of information, and every employer goes or sends there for his labour; and the first question that arises is: To what extent are both sides going to use the Exchanges? As regards the men, there is little reason to anticipate any reluctance, as a man out of work is generally ready to give at least a trial to anything having any claims at all to be a means of finding him work. Men in the building trades, at any rate, have only been deterred from using such Exchanges as at present exist by the suggestion of "relief" or "distress," which clings to them by reason of their origin, they having been inaugurated by the Central Unemployed Body for London. That body are entitled to every praise for what they have achieved in the face of all the difficulties and handicaps which they have had to encounter, but the fact remains that most building trade operatives avoid such Exchanges as long as they can, from their objection to being associated with distress measures. As a matter of fact, the present Labour Exchanges are completely separate, in organisation, from the relief works of the central body.

All in the building trades know that, in questions of engaging labour, the term "employer" means in effect, the general foreman or else the various trades foremen. Their present system (the average seeker after work would probably smile at the use of the term "system" in such a connection) may be briefly described as taking on at the gate. Now, whilst this is a fairly easy method for the foreman, especially during the slackness prevailing in the trade during the past year or two, when he wants men, it causes him endless trouble when he does not. Moreover, the Exchanges will give him a much wider field of selection, as he can choose from every man available at the moment in his entire area, or even, as already described, from the entire country if he likes, whilst now he can only choose from those whom chance has brought to his own particular gate at that particular moment. Most foremen attach considerable importance, and naturally so, to having, if possible, men who have worked for them before this personal connection can be perfectly well preserved under the new conditions, as, it being known in what area any individual man will have registered if seeking work, it will be a matter of a very few minutes to ascertain (telephones will play a very important part in the work of these Exchanges) definitely whether or not that man is available.

Turning again to the case of the men, it is to be hoped the various trade societies will look with favour upon the advent of the Exchanges. Certainly they should do so, as one of the first effects will be to save a considerable portion of the trades unions' expenditure on "out-of-work" pay. The vacant books of the various societies do in a small way at present, of course, the work of Labour Exchanges, but only to a very limited extent, and it should be one of the first thoughts of those concerned to extend the usefulness of these books by handing over that portion of their work to the Labour Exchanges.

Another most important point is the action of the Exchanges in case of labour disputes. This will, no doubt, not be left to the discretion of individual superintendents of Exchanges to determine, but will be covered by the regulations drawn up by the Board of Trade. There is much to be said for the policy of the present Exchanges in suspending all action in such cases, but it must be admitted that this policy amounts to some extent to taking sides against the employer, an objection which will apply more and more as the Exchanges become more fully developed, because to just such extent as the employer comes to look upon the Exchanges as his only source of supply for labour, precisely the attitude, be it noted, which he is asked to adopt, to just that extent will the policy mentioned amount to cutting off his supply. This action would amount to a grievous hardship where he was not at fault in the dispute. Such action could then hardly be defended as the attitude of neutrality which an employer has a right to expect in a national organisation. On the other hand, to ignore the dispute and to continue to notify the vacancies as if such dispute did not exist would be to take sides against the men. It is probable that the soundest policy in these cases will be found, as in so many others, in a compromise, by which the vacancies are notified, but accompanied by an intimation of the state of affairs causing the vacancy, as is at present done in Berlin and in most of the German cities.

The great consideration amongst the building trades, as indeed in all others, should be that here is the first really scientific attempt to deal with unemployment.

Mr. John Allen, of Gloucester, who has died in that city at the age of seventy-two, was formerly a partner in the firm of Moffatt and Allen, timber merchants.

* * *

Mr. James Ebenezer Saunders, of Chelviston, Eltham Road, Lee, architect and surveyor, formerly deputy-alderman and afterwards Alderman of the Ward of Coleman Street, some time a member of the Metropolitan Board of Works, and of the London School Board, one of the oldest members of the City Lieutenancy, to which he was appointed in 1876, a member of the Geological, Royal Astronomical, and Zoological Societies, and of the Fishmongers', Blacksmiths', Painters', Curriers', Needlemakers', and Wheelwrights' Companies, who died on November 24th, aged 79, left estate of the gross value of £8,983, with net personality £5,767.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION
Dec. 18.	TRAINING COLLEGE FOR TEACHERS, Kirkstall Grange, Far Headingly, Leeds. Architects practising in Leeds are invited to submit competitive designs for the above College. Sir Aston Webb, C.B., R.A., F.R.I.B.A., has been appointed Assessor. Copies of the conditions of competition and instructions, a plan of each floor of the educational blocks and of the hostel blocks, also an estate plan, showing a suggestion for grouping the various buildings, may be obtained from James Graham, Secretary for Education, Education Department, Leeds. Designs to be delivered not later than 12 o'clock noon. Deposit: £2 2s.
Dec. 31.	SOUTHEND-ON-SEA. NEW COUNCIL SCHOOL. Limited to Architects practising in the Borough. Conditions of competition and plan of site on application to J. W. Barrow, Clerk to the Education Committee, Education Offices, Municipal Buildings, Southend-on-Sea.
1910. Jan 1.	LARNE. TECHNICAL SCHOOL IN VICTORIA STREET. For the Larne Technical Instruction Committee. Total cost, including fixtures and enclosing of ground, not to exceed £3,600. Premium, £21, merged. Successful competitor will receive commission of 5 per cent. for supervision, including plans, specifications, estimates, and *Bills of Quantities*. Particulars of Thomas Clearkkin, Secretary, Technical In-Instruction Committee, Larne.
Jan. 1— Mar. 1.	NEW BUSINESS PREMISES, LEEDS.—The Directors of the Leeds Industrial Co-operative Society (Ltd.) invite competitive drawings and estimates for new Business Premises and Offices, to be erected on the site of the old "Mercury" Office, Albion Street, Leeds. Premiums of £100, £50, and £25, respectively are offered, and will be awarded to the authors of the designs and plans placed first, second, and third by the Assessor. Conditions of competition, and lithographed plans and other particulars, will be forwarded on application to the Secretary, on or before Jan. 1, 1910, on receipt of stamped addressed foolscap envelope, accompanied with a deposit of £2 2s. Competitive designs and plans to be sent in to the Secretary, John W. Fawcett, Leeds Industrial Co-operative Society (Ltd.), 10, Albion Street, Leeds, not later than March 1, 1910. To the architect deciding not to compete, and returning all documents within seven days, the deposit will be returned.
Jan. 15.	ELEMENTARY SCHOOL, KEIGHLEY.—The Education Committee invite competitive designs and estimates for a new Public Elementary School for older children to be erected at Highfield, Keighley. Printed instructions and conditions, with a lithographed plan of the site, may be obtained on application at the Education Offices. Designs and estimates to be sent by Jan. 15 to H. Midgley, Secretary, Education Offices, Keighley. Only architects residing or carrying on business within the Borough are invited to compete.
Jan. 31.	NATIONAL MUSEUM OF WALES. The Council desires to receive competitive designs for the erection of a new National Museum at Cardiff, Three premiums are offered of £200, £150, and £100, for second, third, and fourth. The Council have appointed Sir Aston Webb, R.A., Mr. John J. Burnet A.R.S.A., and Mr. Edwin T. Hall, F.R.I.B.A., as Assessors. Particulars and plans of the site will be supplied to competitors on payment of a fee of £2 2s., returnable if all papers are returned within 14 days. Inquiries to be addressed to Dr. Wm. Evans, Hoyle, Director of the Museums. City Hall, Cardiff.
Feb. 1.	OLDHAM, EXTENSION OF THE TOWN HALL. Restricted to Architects practising or residing in the Borough. Premiums of £50, £30 and £20, for the three designs placed 1st, 2nd and 3rd, and a sum of £5 will be paid to all unsuccessful competitors who send in a complete set of plans in accordance with the instructions. Plan of site, with instructions and suggestions for architects obtainable from E. C. Foote, Borough Surveyor, Town Hall, Oldham. Deposit: 21s.
Mar. 1.	GLAZED BRICKWORK DESIGNS AND ESSAYS. A committee of glazed brick manufacturers invite designs for works to be executed in glazed brickwork, also essays as to the advantages to be derived from the use of this material in accordance with conditions to be obtained from J. Johnston Green, 142, Liverpool Road South, Southport. Premiums of 100 guineas, 50 guineas and 25 guineas awarded to designs and essays jointly. Assessor Mr. Max Clarke, F.R.I.B.A., appointed by the President, R.I.B.A.
No Date.	CRADLEY HEATH. The trustees of the United Methodist Church invite Architects to submit designs on approval for Sunday School with seating accommodation for about 1,000. For particulars, Mr. C. Clee, Cradley Heath, Staffs.

Correspondence.

[The Editor declines responsibility for the statements made or opinions expressed by correspondents.]

Builders' Locked-up Capital.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Your correspondent "A. G. W." is within the mark when he says that some architects have to be worried into settling accounts.

But why this appalling apathy of builders? There is no other industry carried on by these happy-go-lucky methods. Yet builders attempt the impossible. No wonder there are so many left by the wayside, financial cripples.

Any builder of lengthy experience can give you many instances of honest hard-working men who have had their lives made almost unbearable and sadly shortened by this custom of holding up balances. Several recent instances have come to my knowledge.

1. A builder put up a public hall for a religious body five years ago. He has a balance of some £400 outstanding.

2. Hospital built by public authority. Extras of upwards of £600 ignored by architect in his final certificate. The issue of legal process backed by the builders' Federation has, I understand, now succeeded in getting a settlement of this case.

3. A religious body erected premises and occupied them twelve years ago. The builders time after time sought a settlement. After extraordinary pressure, and heaven knows how much mental wear and tear, the builders obtained some £3,000 outstanding, nine years after due date!

4. A large mill occupied over two years. Builder is waiting for his balance of £2,000.

Your correspondents complain of many cases. Similar ones are of common knowledge. What remedy is to be applied to gather in these dead balances?

First, the insistence on an arbitration clause in all contracts as in the form agreed upon between the National Federation and R.I.B.A.

Secondly, the insertion in that agreement of a date after which the ascertained balance due the builder carries interest.

The building owners would then be anxious for a speedy settlement, instead of holding the architect back from settling up, as in many known instances.

The evil is so widespread that I am afraid a good many builders think it is only a natural state of things, and despair of its ever altering. The only people that will force an alteration are the builders themselves.

If the builders' Federation is going to justify its existence, it is by finding a solution to such questions as this.

A LANCASHIRE BUILDER.

Mr. Chas. T. Overmann, 21, Spring Gardens, Manchester, informs us that in addition to representing Messrs. H. Hope and Sons, Ltd., of Birmingahm, for casements, patent glazing, etc., he has been appointed sole agent for Messrs. Gibbs and Canning, Ltd., terra cotta manufacturers, of Tamworth

Trade and Craft.

Eternit Tiles; Keltic Pattern.

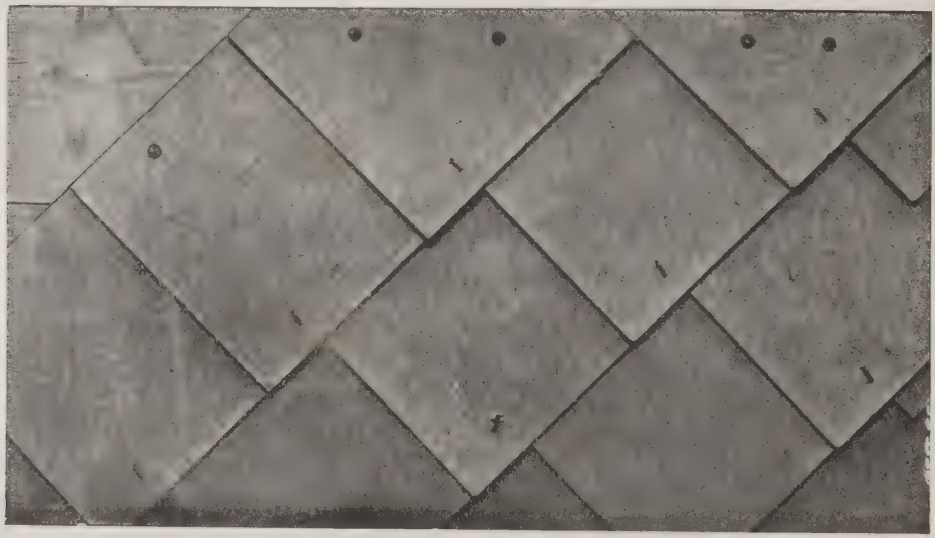
The Eternit tiles, which are accepted by all fire assurance companies as being fire-resisting and incombustible, are made of a material that is also of the highest value as a non-conductor of heat and cold. The tiles are non-absorbent, weather-tight, and damp-resisting, the perfectly smooth faces permitting of their being laid diagonally and with close joints. While very light in weight, they are extremely tough and strong, so that the risk of breakage in handling and in transit is nearly nil, while the tensile strength is 5,781lb. per square inch, and the crushing force 8,281lb. per square inch. Yet the weight of an Eternit roof is only about 21lb. per square yard, allowing for 2¾in. lap. The tiles are stocked in three colours—grey, blue, and terra-cotta—and they may be fixed in either of three patterns, denoted as "C," "F" (or honeycomb), and Keltic. An illustration of the Keltic pattern is here shown. This pattern of eternit tile is well suited for fixing on steel-framed roofs, great economy resulting from the fact that the steel laths are spaced at 13in. centres for 15¾in. by 15¾in. tiles at 2¾in. lap, as in the case of Roman roof tiles. The æsthetic effect of this arrangement of tiles is, we think, distinctly pleasing. Full details may be obtained from G. R. Speaker and Co., contractors to H.M. Government, 29, Mincing Lane, London, E.C.

The Invisible Slate Clip.

We have received for notice samples of a new slate clip called "The Invisible," and justifying the name. The clip is exceedingly simple in construction, comprising two pieces—namely, a steel eylet and a steel toothed spring, an ordinary nail serving as a wedge. The average roof repairer uses lead, copper, or zinc clips, and sometimes copper wire, all of which are visible and are very liable to get out of position through the action of the sun and snow, with the result that the roof again requires attention. This clip is subject to none of these disadvantages, and can be used for any size slate, but it cannot be used for tiles. It commends itself to architects, because it enables the repair of broken slates without rendering the roof unsightly, and it effectually prevents slates from slipping out of position. Full particulars and illustrations showing the method of fixing may be obtained from Kerner-Greenwood and Co., King's Lynn.

W. Gradwell and Co., Ltd.

Messrs. W. Gradwell and Co., Ltd., of Barrow-in-Furness, have just completed the following contracts: Timber piled dolphins at the Egremont Ferry in the river Mersey; driving 196 iron piles at Fleetwood for the Fleetwood Victoria Pier Co., Ltd. They also have the following contracts in hand: Timber piled groyne and concrete work at Workington for the Workington Iron and Steel Co., Ltd. Timber piling on the river Eden for the Workington Iron and Steel Company, Ltd. Concrete piling at the Fish Dock, Fleetwood, for the Lancashire and Yorkshire Railway Company. Pile-driving foundations and submarine concrete work at the Lighter Shed, Cavendish Dock, Barrow-in-Furness, for Messrs. Vickers, Sons and Maxim, Ltd.



ETERNIT TILES LAID IN KELTIC PATTERN.

Coming Events.

Wednesday, December 15.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. Andrew Muir on "Mediæval Stone Carving," 8 p.m.

EDINBURGH COLLEGE OF ART.—Professor A. D. F. Hamlin (Columbia University, N.Y., U.S.A.), on "Architecture in America," 8 p.m.

Thursday, December 16.

Annual Meeting of First Garden City, Ltd., Inns of Court Hotel, High Holborn, W.C., 3.30 p.m.

Friday, December 17.

EDINBURGH COLLEGE OF ART.—Professor A. D. F. Hamlin (Columbia University, N.Y., U.S.A.), on "Architectural Education in America," 8 p.m.

INSTITUTION OF MECHANICAL ENGINEERS.—Mr. William Mason on "Mild-steel Tubes in Compression and under Combined Stress," and Mr. C. A. M. Smith on "Compound Stress Experiments," 8 p.m.

INSTITUTION OF CIVIL ENGINEERS.—Students' Meeting. Mr. H. T. Tudsbery on "The Foundation and Construction of Dock Walls," 8 p.m.

Saturday, December 18.

INSTITUTION OF CIVIL ENGINEERS.—Students' visit to the printing works of Messrs. Edward Lloyd, Ltd., Salisbury Square, E.C., 8.30 p.m.

Monday, December 20.

LANCASHIRE, CHESHIRE AND NORTH WALES BUILDING TRADES' EMPLOYERS' FEDERATION.—Half-yearly meeting at Liverpool.

Tuesday, December 21.

ANCIENT ARCHITECTURE LECTURES AT THE BRITISH MUSEUM.—Mr. Banister Fletcher's 12th paper. Seventh and concluding lecture on "Greek Architecture." End of Michaelmas term. 4.30 p.m.

In our notice of the Kodak Company's new buildings, at Wealdstone, in last week's issue, it should have been mentioned that the building is fitted with a number of the "Dreadnought" fireproof doors, supplied by Fireproof Doors, Ltd., 46, King William Street, London, E.C.

* * *

The Sheffield Building Trades Exchange and Club, of which the president is Mr. A. J. Forsdike, and the secretary, Mr. Thos. Smith, appears to be an exceedingly flourishing institution, which pays special attention to the social side of organisation. The neatly produced programme for the current session comprises not only a long list of such entertainments as billiard tournaments, whist drives, lectures, smoking concerts, and cinematograph exhibitions, but also an annual children's party on New Year's Day. One could hardly imagine a more effectual means of promoting sociability and of retaining and stimulating interest in the more prosaic objects for which the members are banded together.

MONTHLY OFFICIAL REPORTS.

THE NATIONAL FEDERATION.

Meeting of Executive Council and Annual General Meeting.

The Executive Council and annual general meetings have been fixed for January 25th and 26th, 1910. Matters for the agenda of these meetings should reach the National secretary not later than December 31st next.

Conditions under which Tenders are Required to be Sent in.

A similar conference to that reported in the last month's report as having been arranged with the R.I.B.A., has been arranged with the Institute of Civil Engineers for to-day.

Departmental Committee on Railway Agreements.

Mr. J. G. Robertson, of S. Shields, gave evidence before the above committee on the 8th inst. with reference to complaints of inadequate facilities for handling luggage and goods, undue delays of goods in transit and unreasonable claims for demurrage, etc., etc., occurring in the district of S. Shields.

The Comparative Statement of Wages and Hours of Labour.

Is republished in this issue with such corrections as have come to hand.

Secretarial Changes.

Mr. Costigan has retired from the secretaryship of the Southern Counties Federation, and is succeeded by Mr. F. Wolley, of 5, Portland Street, Southampton.

Mr. Bigwood has retired from the secretaryship of the Birmingham Association, and is succeeded by Mr. G. H. Wright, 22, Winchester House, Victoria Square, Birmingham.

The Only Way.

In adopting a new set of rules and generally re-organising, the Nottingham Association have adopted the following: "The official journal of the Federation will be supplied by the Association each week, free of cost, to all ordinary members whose subscription is paid for the current year."

This is the only way to make an official journal truly justify its title, and should be generally imitated.—A. G. White, Secretary.

LANCASHIRE, CHESHIRE, AND NORTH WALES FEDERATION.

The monthly meeting of the Administrative Committee of the Lancashire, Cheshire, and North Wales Federation was held at the Board-room, Manchester, on Friday, November 12th, when the president (Mr. W. Cooke, jun.) occupied the chair. Before proceeding with the business on the agenda, the president referred in sympathetic terms to the death of Mr. G. H. Storrs (brother to Mr. James Storrs, J.P.), and the tragic circumstances attending it, and moved a vote of condolence and sympathy with Mrs. G. H. Storrs, Mr. James Storrs, and Miss Lindley.

It was reported that a deputation from the Bolton Association had waited upon a firm of architects in that district who had recently made a practice of asking for a three years' maintenance in their contracts, with the result that they had agreed to leave the time open to be agreed upon at the time the contract is signed. The Bolton Association were asked to keep the committee fully informed as the matter proceeds.

Messrs. J. G. Davies and Co., builders and contractors, Crodsham, were elected to individual membership of the Federation.

Notice of several alterations to the Conciliation Board rules was read from the National secretary, and after discussing the same at some length, it was resolved: "That with the exception of proposal (c), which is entirely a matter between the operatives themselves, this Committee cannot recommend the adoption of the suggested amendments."

A letter was read from the National secretary stating that owing to the fortnight's recess in the House of Commons the meeting of the Departmental Committee on Railway Agreements had been postponed, and that the time allowed for the preparation of evidence thereon had been extended in consequence. It was agreed that a copy of the communication be sent to the local associations with a request that they give the matter their consideration.

It was agreed to invite suggestions from the local associations on the question of the "Conditions under which tenders are sent in," to be forwarded on to the National Committee, who are at present dealing with the matter.

A communication was read from the secretary of the Northern Centre on the question of "uniformity of Federation rules," and it was agreed that copies of the rules of this Federation be supplied as requested, with an intimation that this committee recommend their adoption as a basis for uniformity.

It was reported that the dispute between the Altrincham Association and the Operative Joiners' Society, regarding their boundary, had not yet been settled, and Mr. J. Hamilton, Altrincham, reported their position. After discussion, the secretary was instructed to write the Manchester, Altrincham, and Stockport Associations requesting them to forward a map showing their boundaries on the Altrincham side to the Manchester Operatives' secretary, and, failing a settlement, the matter should be again reported to this committee.

The sub-committee appointed to consider the question of "Delayed Payments in Contracts," gave their report, which suggested some amendments to Clause 30 of the National contract form. Ultimately it was agreed to postpone the matter until the next meeting, and that in the meantime the recommendations of the sub-committee be printed and a copy sent to every member of this committee. The secretary was also instructed to write asking that the matter be placed on the agenda for the next meeting of the National Administrative Committee.

The secretary reported that the recommendations of the sub-committee appointed to consider the Government schedule of contract prices had been sent on to the National secretary.

A letter was read from the Bury Association on the question of "guarantors to corporate and other bodies," and it was agreed that the matter be placed on the agenda for the next meeting, and that each member of the committee be supplied with a copy of the letter.

The secretary presented a preliminary statement of the reserve fund account, and asked for instructions therein. It was resolved that a further appeal should be sent to all local associations.

Some discussion took place regarding the affiliation of the Adlington district with the Bolton Association, but as the secretary had for some time been endeavouring to organise that district with Chorley, the matter was left in his hands.

The quarterly meeting of the Plasterers' Trade Committee of the Federation was held at the Boardroom of the Liverpool Master Builders' Association, 24, Sir Thomas Street, on Wednesday, December 1st, when Mr. James Higson, J.P., Manchester, presided over an attendance of six representatives from the various towns.

The report of the sub-committee appointed to consider the desirability of amending the sub-contract form was then considered, together with a draft amended form. After considerable discussion, it was resolved that, subject to one or two amendments, the proposed form be sent on to the various trade committees, with a request that they will give the same due consideration.

The chairman gave his report on the recommendations made to the schedule of contract prices for Government work, which was considered satisfactory.

Other matters of branch trade interest were discussed, but no formal resolutions were passed.

The Finance Committee met at the Boardroom, Manchester, on Friday, December 3rd, to consider matters of Federation finance, and their report will be presented to the Administrative Committee at their next meeting.

The half-yearly general meeting of this Federation has been fixed to be held at the Hotel St. George, Lime Street, Liverpool, at 2.30 o'clock, on Monday, December 20th next.

The Executive Board will hold their quarterly meeting at the same place prior to the half-yearly meeting at 12.45 o'clock (noon).—JOHN TOMLISON, Secretary.

BARROW-IN-FURNESS ASSOCIATION.

Secretary: J. Baker.

The monthly meeting of Barrow-in-Furness Association was held on November 23rd.

Communications were read from the firm written to regarding the providing of quantities with tenders for over £30, and also from the railway company regarding better telephonic communication. The secretary was instructed to ask for an interview with the former; the latter matter is still pending.

A communication was read from the operative plasterers with respect to others than their own trade doing their work. It was resolved to reply that the job in dispute was so small that it was not deemed worth while to send for a man specially to do the work.

Two new members were balloted for and accepted. The secretary reported that tenders had been asked for without quantities for work in connection with the Labour Exchange's proposed offices, the cost of which would amount to considerably more than the limit allowed for by rule. The secretary had communicated with the members, who had been invited to tender, and also with the authorities requiring the tenders, and it was now understood that quantities were being prepared.

Arrangements were made for the annual dinner.

MANCHESTER, SALFORD, AND DISTRICT ASSOCIATION.

Secretary: John Tomlison.

The monthly meeting of the Master Plasterers and Painters' Branch of this association was held at the Boardroom, Blackfriars Street, on Tuesday, November 9th, when Mr. T. A. Locan occupied the chair.

The question of fixing a subscription to meet incidential expenses incurred by the branch was considered, and a recommendation made to the General Committee.

The question of rescinding Rule 3 of the branch rules was down for consideration, and after discussion it was decided to postpone the matter until the next meeting.

The proposed agreement with the Plaster Partition Manufacturers regarding the fixing and finishing of their partitions was again on the agenda, but owing to the decision regarding the branch rules, it was thought advisable to defer the matter until the next meeting.

The monthly meeting of the Plaster Partition Manufacturers was held on Tuesday, November 16th, when the chief matter under consideration was the proposed agreement with the master plasterers.

The quarterly meeting of the General Committee was held at the Boardroom, on Thursday, November 18th, the president (Mr. Samuel Gerrard) in the chair.

The half-yearly report, as drafted by the secretary, was taken as read, and recommended to the half-yearly general meeting.

A communication was read from the L.C. and N.W. Federation regarding the Altrincham boundary, and the secretary was instructed to write to the secretary of the Manchester Operative Joiners' Society in accordance with the Federation's request.

A recommendation from the Plasterers' and Painters' Branch to impose a subscription on members of the branch to cover incidental branch expenses was duly confirmed.

The half-yearly general meeting of the association was held at the close of the above meeting, when the president (Mr. Samuel Gerrard) again occupied the chair.

The half-yearly report as presented by the committee was taken as read, and was adopted for circulation to the members. The report which gives a full account of the workings of the association during the past half-year is very satisfactory, considering the very depressed state of trade, and in very concise form shows the usefulness of a strong building trades organisation in a city like Manchester.

The secretary was instructed to call, before issuing the report, a meeting of the bricklayers' branch, with a view to getting them to appoint their trade committee.

A recommendation from the committee to amend Rules 5 and 9, so as to provide that the monthly meetings of the committee and the half-yearly general meetings shall be held on "third" instead of "second" Thursdays in the month, was considered and adopted.

It was agreed to adopt the Federation arbitration rule locally, and to print the same in the rule books.

The question of strictly enforcing the inter-trading rule was referred to the General Committee.

It was agreed that the association should nominate Mr. Thomas Rowbotham, plumber, in addition to the two present members—Messrs. H. Matthews, J.P., and Wm. Tinker—to represent the L.C. and N.W. Federation on the National and Northern Centre Executive Councils.

Communications were read from the L.C. and N.W. Federation with reference to the "Departmental Committee on Railway Agreements" and the "Conditions under which tenders are sent in." but it was decided to take no action in the matter.

A recommendation from the plasterers' and painters' branch to adopt a rule that each member of the branch shall pay a subscription of 4s. 6d. per annum in addition to the annual subscription to the association, to meet incidental expenses incurred by the branch, was unanimously adopted

---

A special meeting of the Master Builders' Committee of the association was held at the Boardroom, on November 26th, to consider the conditions for the Salford Town Hall Annexe Extension contract. After considering the matter at some considerable length, it was resolved that a letter be sent to the Town Clerk informing him that the conditions were such as could not be ac-

ROOFING SLATES
Velinheli, Penrhyn and Westmoreland.

cepted by members of this association, and requesting him to receive a deputation thereon.

The secretary was also instructed to circularise the members informing them of the decision of this meeting, and requesting them to refrain from tendering until the conditions are considerably modified.

As a result of the action taken by the association in this matter, and the deputation's interview with the Town Clerk, it is expected that the conditions will be somewhat amended, but definite information is not yet to hand. It is, however, officially understood that the time for the tenders to be sent in has been extended, and that therefore the matter is receiving the consideration of the Borough Committee.

In accordance with instructions received from the half-yearly general meeting, a meeting of the bricklayers' branch was called on Thursday, December 2nd; and although there was only a very meagre attendance, the Branch Trade Committee was duly appointed, subject to confirmation at a fuller meeting.

YORK ASSOCIATION.

Secretary: J. Hague, Solicitor.

An Executive meeting of York Association was held at the Old George Hotel Pavement, on Wednesday, December 1st, the Lord Mayor in the chair.

Mr. Biscombe reported the result of the discussion at last Federation meeting on the draft sub-contract form, with reference to which a suggested addition had been made by the local association.

Correspondence was read from the secretary to operative plasterers re formation of joint committees, decision on which would be sent us after their December meeting. A letter was read from the Yorkshire Federation with reference to tendering for certain work, as to which a difficulty had arisen owing to the objectionable nature of the conditions. It was resolved that we notify our members as to the desirability of not tendering until the conditions were considerably modified.

It was unanimously agreed that the president, vice-president, treasurer, and secretary be recommended for re-election at the annual meeting.

With reference to the Executive, it was considered that, having regard to the importance of the work to be done and the undoubted spread of interest amongst the members in the work of the association and Federation generally, it was very desirable that the number of members composing the committee should be increased. It was felt that such a step would also encourage still more the interest of the younger members, and considerably add to the progressive nature of the association. It was therefore decided to recommend to the general annual meeting that the existing rule be amended in order to allow the introduction of five additional members on the Executive.

It was resolved that the chairman should make a special appeal to the members at the annual meeting to support the National reserve fund.

Proposed amendments to National Conciliation Board rules were read and considered, but no recommendation was made at the meeting. It was considered the proposals required further consideration. It was thought that the proposals, if carried, would remove the question of settlement of disputes away from the proper quarter; and the appointment of a fixed paid official of the Board of Trade was thought unlikely to prove the most satisfactory way of dealing with any dispute which got so far as the National Board, and which even they were unable to settle. It was resolved to recommend thorough discussion of the proposals at the next general meeting.

The meeting recommended that a register of accidents to workmen would be most useful to the association, and the matter would be placed before the annual meeting for adoption.

Two new members were elected.

THE NATIONAL FEDERATION OF BUILDING TRADE EMPLOYERS OF GREAT BRITAIN AND IRELAND.

[*All Rights Reserved.*]

COMPARATIVE STATEMENT showing the hours worked per week, and the rate of wages per hour in the various branches of the Building Trade in the undermentioned Federated Towns.

EXPLANATORY.—The towns are grouped by Centres and Federations, each group in two sections—A, containing towns and cities of over 100,000 inhabitants, and B those of 100,000 inhabitants and under.

Information as to non-federated towns may be had from the undersigned on application.

A. G. WHITE, Secretary, 31 & 32 Bedford Street, Strand, London, W.C.

NOTES.—Where a sliding scale of hours is worked in winter the average of hours is given. The Mason's rate given is for Bankers; Fixers usually ½d. per hour extra. Abbreviations—l-dk, light to dark; a-m, As Men. B=Bankers; F=Fixers.

NOTICE.—This list is subject to further revision, the returns being incomplete at the time of going to press.

Right to the Point

The letter which we quote below (typical of thousands more)—brief—cogent—right to the point—puts in a nutshell the claim and the justification of the International Correspondence Schools.

Smethwick, Warwickshire.

International Correspondence Schools Ltd., London.

Gentlemen:
I am pleased to be able to assure you of my satisfaction with the I.C.S training. When I enrolled some little time ago, I was anxious to secure a better salary. You will be pleased to know that I have had my salary advanced now, and I attribute this to the success of your teaching.

(Signed) VINCENT MOSSOP.

Mr. Mossop wanted a better salary. He knew the claim of the I.C.S. to raise salaries. He enrolled. He **got** a better salary.

You want a better salary. You know the claim of the I.C.S. There is a coupon below for you. "A word to the wise."

COUPON

Registrar, International Correspondence Schools, Ltd.
Dept. 212B, International Buildings, Kingsway, London, W.C.

Please send me particulars of your "salary raising" training in the subject before which I have marked a "X."
(Or state any other subject, for there are over 120 International Correspondence Schools Courses..)

Art and Mathematics. The discussion which followed the reading of Professor Hamlin's paper on "Architectural Education in America," before the R.I.B.A., brought out some interesting divergencies of opinion on the perennial subject of the education of the architect. Mr. T. G. Jackson expressed the somewhat unorthodox view that general culture is by no means a primary necessity for success in the profession of architecture. He contended that the artist is born, not made, and that no amount of learning could supply natural deficiency. That is obviously true enough as far as it goes; but the schools that are powerless to create genius are surely incapable of quenching it. Superlative genius is so rare that we cannot legislate for it, and so forceful that we need not. Yet surely genius has its degrees, its types, and its temperaments, and what would stimulate one type might stifle another; and we would gently hint that the somewhat outworn *nascitur non fit* theory may be easily pushed too far. Mr. Reginald Blomfield, on the other hand, confessed to a preference for the man of general culture—a view that has been consistently supported in these pages. Several of the speakers confessed—perhaps with a dangerous approach towards "the pride that apes humility,"—to a lack of the higher mathematics. But would Wren have been a better architect if he had been a worse mathematician? Professor Hamlin, in reply, vindicated very thoroughly the system of instruction that he had described. The two years' liberal education, he contended, were a necessary adjunct to the general equipment of the architect. The preliminary course, he contended, was contributory to the actual study of architecture; and in this sense it was an essential factor in the scholarly development of an enduring art. The necessity for mathematical training is doubtless greater in America than in this country, and we must admit that Mr. Jackson hit upon a truth when he hinted that there is certainly some disparity between the artistic and the mechanical mind, Wren's rather rare case notwithstanding. It seems probable that, in this country, in view of the growing adoption of American systems of construction, the American system of architectural education may be very profitably studied, and we are very grateful to Prof. Hamlin for the exposition of it that he has so clearly set before us.

A Matter of Business. We receive, through the post, by the telephone, and even by special messengers and personal visits, so many enquiries with respect to commodities, that a vast amount of time and trouble is expended in looking up the required data. So far as our readers are concerned, we do not complain. On the contrary, we are glad to be of service, and are indeed delighted to know that the journal is so generally esteemed for its practical helpfulness. Nevertheless, we feel bound to protest that much of the labour that thus devolves upon us would be rendered unnecessary if the vendors of the goods were more keen to keep them in evidence by means of constant advertising. It is quite clear to us that very much business is lost owing to this neglect; for it may be reasonably assumed that the enquirers who take the trouble to seek our aid in the search for a commodity that, ipso facto, is insufficiently advertised, represent only a fraction as compared with those who, from various causes—as urgency of requirement and dread of delay, or fear of troubling us in a matter concerning which our interest may not be clearly apparent—make no effort to obtain the particular goods they prefer, but adopt some more easily procurable substitute. Evidently, therefore, much custom is lost from lack of publicity. Upon our own position in the matter we do not wish to lay undue stress; but we must add that, while, on the one hand, we are very glad to be of service to subscribers, on the other hand we feel that it is not quite fair that we should be thus required to act as the unpaid agents of those traders who are so unbusinesslike as to make their goods a matter of enquiry and research. It is not simply a question of turning up a name in a directory. Very many enquiries refer to special lines with arbitrary names, registered or unregistered, and it is often very difficult, and in some quite impossible, to trace them. A typical instance is before us. A surveyor, in asking us to supply an address, states that he prices largely for builders, and is often at a loss for addresses where specialities may be obtained, because the vendors do not advertise. Surely, to allow good things to sink into obscurity in this deplorable fashion is to neglect one of the first principles of business. Constant and systematic publicity is, as all experience shows, essential to a full measure of prosperity, even when the commodity is of such approved value as to cause it to be sought for—often, as we have shown, in vain, because the vendors have allowed themselves to drop out of notice.

Nathan the Unwise. Municipal ideas on art are apt to be—very municipal, even though the municipality happens to be that of Rome, where, if anywhere, good taste might be supposed to reign supreme. The Mayor, Commendatore Nathan, however, is doing his best, or his worst, to correct that impression. He had put forward a scheme for uniting the three Capitoline palaces. It was unanimously rejected by the Supreme Council of Antiquities and Fine Arts, a body which, we are assured, is composed of all the leading archæologists and art critics of Italy. Their action is approved by almost the entire Roman press and people, who regard it as sacrilegious to tamper with the work of Michel Angelo. The Mayor, although his name is more suggestive of the meekness of Moses than of the obduracy of Pharaoh, has hardened his heart and let loose the vials of his wrath. It was he who recently gave a public warning to foreigners that they were not wanted in Rome if they dared to disagree with municipal ideas of beauty. He now heaps scorn on the Supreme Council, and declares that, in spite of it, he will carry out his fell purpose. In retort, he is warned that his action would be in direct contravention of the law of 1909—passed, apparently, not a moment too soon—for the preservation of historic and artistic monuments. The only question is whether the Capitoline palaces come under that head, and pending decision on this point, much irreparable damage may be done by a determined Bœotian of the type of Commendatore Nathan, who is surely not a descendant of Nathan the Wise. The conflict will be watched with considerable interest by those who are anticipating similar troubles with strong-minded municipalities in our own country as almost the first fruits of the Town Planning Act, which, at the outset, is pretty sure to be interpreted with more zeal than discretion. This lesson from Rome will not be lost on those who fail to see the necessity for strengthening the hands of the advisory committee that has been formed for the direction of town-planning reform into right channels. The Roman father (civic variety) is not unknown in this country, and his severities will have to be kept in check by some influential counteracting force.

Professional Tendering. The proposed erection of a small chapel at Cwmgorse, which, from internal evidence, would seem to be somewhere in Wales, is doubtless an insignificant matter in itself; but it happens that the terms in which the project is advertised favour a system to which architects strongly object. Tenders are invited for plans, specifications, quantities, and superintendence. Hence, it would appear that the status of the architect is either gravely misunderstood or coolly ignored. Architects, the good people of Cwmgorse should know, have a recognised scale of fees, and it seems, on the face of it, rather cynical to invite them to underbid each other. The tendering system, as we have said on former occasions, may possibly be justified in its application to practical building operations, in which the factors of the problem are many and diverse, in so far that, by more or less ingenious juggling with the permutations and combinations of men, materials, and methods, it may happen that one contractor, in particular circumstances—favouring sometimes one tradesman, sometimes another—may be able to do the work more cheaply than others, without injury to himself, his competitors, or the client. The professional man has no such scope for organisation and adjustment. Moreover, to a professional man, higgling and huckstering, and bargaining and bidding, are demoralising and abhorrent. Professional tendering, therefore, is not likely to flourish; but any instance in which it is sought to impose it is worthy of attention, in order that the matter may be more clearly understood, and the tendency thereby checked.

The Town-Planning Conference. The two days' conference on town planning, held at the Westminster Palace Hotel last week, under the very appropriate presidency of Alderman W. Thompson, of Richmond, did not make the mistake of attempting too much, and there was little or none of the vapid rhetoric that usually discounts the value of such meetings. The chairman made the very sensible suggestion that the ratepayers should, at the outset, pay for the best skilled advice available in arranging for the development of their towns. Alderman Bennett, of Warrington, was no doubt correct in his belief that even intelligent and well-informed people have at present only a vague and shadowy idea as to what town planning means, and that there is a good deal of apathy, ignorance, and obstinacy to overcome before the public can be expected to take kindly to ideals that are at present so new and strange. It is wise, therefore, in the Town Planning and Housing Council to inaugurate a campaign of popular education on the possibilities implied in the new Act, and to send round a well-qualified man to address citizens on the subject. Surely, however, one man is utterly insufficient. A score would scarcely suffice for the rapid conversion of the heathen, even supposing the additions of travelling vans and lantern slides. But we are glad to welcome even the smallest beginning of active missionary work. We are sure that it is sorely needed. Merely to overcome ignorance and prejudice is not enough. The public must be educated up to the point of appreciation of what is good, of discrimination and preference, before our essays in town planning can rise to any degree of dignity or beauty. A certain well-marked, pettifogging, and sordid spirit must be overcome, and the people taught to "think in millions," unless every project is to be ruined by the blight of petty parsimony; but the ascent to higher views must be carefully graduated. That large and liberal expenditure on worthy planning and building is money well invested is a gospel that, in these hard times, is likely to be scorned and scoffed at by the multitudinous disciples of Mr. Gradgrind, to whom cheapness and meanness are as cardinal virtues. The Act, we fear, reverses the usual order of things, and is rather in advance of the times; and the revolution in thought, habit and feeling necessary to its successful application can only be achieved by patient, persistent, and enlightened effort. The promoters of garden cities and suburbs, and improved industrial villages, have done noble pioneering work, without which the mere passing of the Bill would have been quite impossible. It remains to do in bulk what they have done in sample, and we should be glad to see some clearer indication of an effort to do it in the grand manner. Money and men are forthcoming for flooding the country with windy political propaganda; and yet it seems almost chimerical to suggest that a band of capable architects should be commissioned to deliver throughout the country, expository lectures on the infinitely more important subjects comprised in the Housing and Town Planning Act. It is a matter in which all the educational authorities in the country ought gladly to cooperate; and, indeed, the subject, giving practical application and combination of many educational items that are at present dealt with in detached and abstract ways—as geography, history, art, and hygiene—might, we think, be profitably introduced into the curricula of the schools. To come back to the conference and the advisory council, we are glad to think that the right direction has been taken; but we should be glad to see it pursued with greater boldness and aggressiveness; a meek and quiet spirit being ineffectual in these blatant times.

Correspondence.

Builders and the Budget.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In reference to the comments upon this subject in your issue of November 23rd, I should be much obliged if you will let your readers know the facts.

Soon after the Budget proposals were published it was considered that land and building development would be seriously affected by its provisions. Careful enquiries were made, letters were written to the Government, and cases quoted by many builders, and finally Mr. Edwin Evans, who is well known as an expert upon such matters, was consulted, with the result that meetings of builders and others interested were held all over London to explain and fully discuss the provisions as they seem to to affect the business above referred to.

Mr. Lloyd George himself was approached, and also the chief valuer at the Inland Revenue office, with the result that it became perfectly clear that both the dealings in land and the building of houses would receive a serious check, and the opportunities of obtaining capital so necessary to carry on the business would be practically closed. These fears were confirmed by many builders, who testified to the calling in of moneys hitherto at their disposal, and the impossibility of tapping fresh sources of supply.

It was found that in no cases since the Budget proposals were put forward had any increase in workmen employed taken place, but on the other hand the shrinkage in number was from 10 to 80 per cent., or on an average something like 35 per cent. whilst no builder could be found who had been bold enough to purchase any fresh stock of building land during the whole of this time. In consequence a private meeting was called on November 17th, at Anderton's Hotel to consider what steps should be taken, at which I had the honour to be called to the chair. This is the meeting referred to in your article, and at which the suggestion of a Federation of master builders and workers was made. Your readers will see it was merely the suggestion made at a first meeting. Since this two or three further meetings have been held, and if you will allow me the privilege, I hope shortly to report to you a movement which I venture to think will be of the greatest importance to the building industry, and which will in no way clash with the National Federation of Building Trades Employers of Great Britain, or any other such useful association.

What our provisional committee desire is to form an association of those more particularly interested in building development. We are quite sure that had the interest of this particular industry been backed by a strong association of those engaged in it, the land clauses as now drawn would never have received the sanction of either the Liberal or Labour Party in Parliament.

I enclose for your perusal a rough proof of a short pamphlet we are issuing.

Yours truly,
H. R. SELLEY.

TWO NOTEWORTHY EXAMPLES

We think that many of our readers will be specially interested in two noteworthy announcements which appear in the advertisement columns of this week's issue. An eminent firm of manufacturers, desiring to erect a large dining hall, which may also serve for concerts, invites the assistance of an architect who has had experience in such work. This is a rather refreshing departure from the usual method of promoting a competition, and it seems to us to be a more certain means of discovering the right man to do the work.

We hope that this example may be followed by many public bodies and building owners. However small a building may be, apparently it is thought correct to promote a competition as the sure way of obtaining a cheap and efficient building. We shall welcome other similar advertisements, and we feel sure professional men throughout the country are in this respect in agreement with us. In another instance a prominent firm of engineers invite applications for a highly responsible position in their drawing office.

Messrs. Walter Lawrence and Son, building contractors, of Canal Works, Waltham Cross and Moselle Works, Tottenham, have removed their head office to 21, Finsbury Circus, London, E.C., where all communications should now be addressed.

* * *

A fire broke out last week at Birmingham Small Arms Factory, which is one of the largest manufacturing concerns in Birmingham. The whole of the fire brigade turned out. The first started in the stationery department—a range of buildings covering an acre and a half. In the same building many thousands of parts of unfinished cycles are stored. The whole of the roof of the stationery department and warehouses was gutted, and damage to the extent of several thousands of pounds was done. The lower rooms, in which cycle components were stored, were filled with water. About 2,000 men are employed at the factory, but it is hoped there will be only a temporary interference with the work.

ARCHITECTURAL EDUCATION IN AMERICA.*

By Professor A. D. F. Hamlin.

The Centennial Exhibition in 1876 at Philadelphia was to two or three millions of people a revelation of the beauties and possibilities of the arts, especially of the industrial and decorative arts. Out of this movement grew such great architectural schools as those of Columbia University and the University of Pennsylvania.

The return of peace in 1865 had been followed by a sudden awakening, especially in mining and the development of railway building and manufactures in the west. This led to the establishment of numerous technical schools, following the lead of Columbia College, which had even in the midst of the war established its school of mines in 1863. The great Massachusetts Institute of Technology was opened at Boston shortly after that date —I think in 1866. At any rate, in that year Professor William R. Ware, then practising in Boston, was charged to study in Paris the system and methods of the department of architecture of the Ecole des Beaux-Arts, with a view to obtaining data and suggestions for a similar department to be created by the Massachusetts Institute. Mr. Ware fulfilled this commission, and the new department was opened in September of that year, with Mr. Ware as its professor of architecture and director. Shortly afterward M. Eugène Létang was invited from Paris to become the instructor in design. This department was placed under the direction of an accomplished scholar, Charles Babcock. A year or two later the State Industrial University of Illinois at Champaign, in that State, followed the example of Cornell, opening a department of architecture under the direction of Professor N. Clifford Ricker. It is a striking evidence of the youth of the American system of architectural school education that the three founders of these first three American schools are at this writing still living, so far at least as I am at present informed. Thus, at the time when the Philadelphia Exhibition marked the close of the Civil War epoch, and ushered in the American Renaissance, there were in the United States three well-established schools of architecture, and these were the only organised and publicly recognised means for obtaining a professional training in architecture. [Professor Hamlin then gave an interesting résumé of the history of American architecture, the main facts of which have been recently dealt with in this journal.]

Of all the Continental European Schools to which Professor Ware might turn for suggestions the great Ecole at Paris was the only one that promised practical results. M. Eugène Létang was called to the new post, which he filled for well-nigh twenty years. The Boston School acquired a high reputation, which it has maintained ever since, in spite of the multiplication of large and well-equipped schools throughout the country. After the death of M. Letang there followed a period during which the school lost somewhat of its pre-eminence in the matter of design; but in 1892 or 1893 M. Despradelle was called from Paris to the chair of design, which he has ever since filled with conspicuous success.

The school at Cornell University and that of the Illinois State University at Champaign, Ill., paid less attention to design and to the artistic side of the course, and more to the practical and engineering sides.

In 1881 Professor Ware was invited by the Trustees of Columbia College in the city of New York—the institution founded as King's College under a charter from George II. in 1754, and which has since developed into the great Columbia University—to undertake the organisation and conduct of a department of architecture, upon the same general lines as that which had achieved such distinguished success under his guidance in Boston. The invitation was accepted, and the new school was opened in 1881 with four students. The department of architecture, developed into a distinct school of architecture, though under the Faculty of Applied Science of the reorganised university, was in 1902 made an independent school, with a view to its later incorporation into a proposed Faculty of Fine Arts. This latest stage of its development was accomplished in 1906.

The present organisation of the course recognises three classes of students: first, those who aspire to the highest achievement in the profession, and to that end seek for a broad foundation of liberal culture through non-architectural studies before taking up their strictly professional courses; secondly, those who, without this broader foundation, desire to pursue a "systematic course of architectural study for three or four years, and to receive a definite academic recognition of their attainment; and, finally, young men, already more or less experienced as draftsmen in the profession, who desire to pursue special studies in architecture, while unable to afford the time or expense of the complete curriculum.

The curriculum leading to the degree of Bachelor of Architecture comprises the following groups of studies:—(*a*) Mathematics and engineering (analytical geometry, plane trigonometry, the differential and integral calculus, mechanics, graphical statics), and architectural engineering — a specialised course in strength of materials, and the calculations for masonry, columns, beams, and trussed constructions, with specific problems to be worked out in full; (*b*) architectural history, including a three years' course in the history of architecture and the history of ornament, with at least one year of readings in archæology and architectural history in French or German; (*c*) office-work and specifications comprising parallel causes in the materials and forms of building and in specifications, and a certain amount of certified work in architects' offices; (*d*) drawing and modelling exercises, occupying from six to ten hours per week through the entire period of study, in architectural draughting, modelling in plasticine, and free-hand drawing from elementary cast, drawing to life, drawing from the nude, and including a considerable amount of training in architectural water-colours; (*e*) graphics, advanced shades and shadows, perspective, descriptive geometry and stereotomy; and finally (*f*) design, considered as the crowning feature of the course, the end and aim to which all other branches pursued are contributory. This course comprises lectures on the theory of planning, composition, colour, and decoration, and a graded series of problems beginning early in the first year of study, and extending to the end of the course, culminating in the graduating thesis—the design of a building upon a programme selected by the student, and upon which he prepares a fairly complete set of scale working drawings and specifications, with strain-sheets, calculations, and structural details of a given part of the edifice.

After many years of experiment, the system followed in the Columbia University School has shaped itself in the following manner. The newly-entered student, already possessed of some slight acquaintance with the Orders and of the elements of drafting, is for three or four months subjected to a further drill in these subjects, in order to be able to express himself with some freedom in architectural form. The Orders are not treated as the sole language or the sole alphabet of the art, but simply as *one* form of architectural expression, and are carefully and thoroughly studied at the outset because there can be no free expression until one has mastered some one medium of expression. The remainder of the first year is then devoted to exercises in composing simple architectural structures with these elements: gateways, porches, vestibules, pavilions, and the like being the subjects assigned. The designs, carefully rendered with all shadows cast in Indian ink, are handed in at a given time, and criticised and judged by some member of the school staff. Upon the completion of a sufficient number of these introductory exercises—usually at the opening of the second year—the student is admitted to the lowest grade in the regular school competitions in design. There are three of these grades—the elementary, intermediate, and advanced. In each of these grades there are from five to seven or eight major problems given out during the academic year, and as many minor or sketch problems, the former requiring each from three to seven weeks for their completion; the latter one day only. The programmes for these problems are prepared by a committee consisting of the six teachers and honorary professors of design, who administer the three *ateliers* or draughting-rooms maintained by the University. The programmes are given out on a day set in the calendar, and the designs must be handed in on another set day, or they are not received at all. Shortly after this they are hung in

RUTHRIESTON ELEMENTARY SCHOOL, ABERDEEN. J. A. O. ALLAN, ARCHITECT.

---

*Abstract of a paper read before the Royal Institute of British Architects, Monday, December 13th.

a suitable exhibition hall, and judged by a jury consisting partly of members of the committee and partly of practising architects invited *ad hoc*.

In style and scale as to drawing and presentation, the designs of the two higher grades somewhat resemble those ordinarily seen at the Ecole des Beaux-Arts Exhibitions of current work, and are of fully equal average quality. But the tendency is away from imitation of Parisian models; more attention is paid to composition and proportion, less to mere draughtsmanship, and the problems, while selected to give full scope to artistic expression, are all more or less practical and American in character.

The brilliant reputation of the Paris school, the fifty years' tradition of the advantages for American students ever since the days of Hunt and Richardson, the influence of the Beaux-Arts Society and its competitions, and the glamour of the affixed title of *Diplômé de l'Ecole des Beaux-Arts*, all tend to draw Pariswards the young American graduate who desires to visit the Old World or to acquire further discipline in design. But the Columbia University School seeks to discountenance the waste of time and duplication of work already done, involved in acquiring the Paris Ecole *diplôme*.

The Society of Beaux-Arts Architects of America numbers now some two or three hundred members scattered through the Union, and including some of the most distinguished of the younger and middle-aged architects. Its very active committee on education issues each year, according to a carefully prepared calendar, two classes of problems, each comprising seven or eight major problems and as many *esquisse-esquisses* or one-day sketches. The printed programmes for these are given out on a set day at a dozen or more centres in different cities, under a representative, in each place, of the Society, who gathers the sketches (the competitors retaining tracings of them) and sends them to the New York office. Anyone may compete; the majority of those availing themselves of the privilege being young draftsmen in the offices, who work upon the designs at night, in *ateliers* conducted by themselves under the direction of a patron or critic belonging to the Society. A select jury judges each set of designs, awarding medals and graded mentions, and the highest premiated designs are published in one or more periodicals.

Discussion.

Mr. T. G. Jackson, R.A., in opening the discussion, thanked Professor Hamlin for his extremely clear account of architectural development in America. It appeared that in their colleges there were three distinct courses in operation—A, leading to a diploma in architecture; B, leading to a certificate, no degree being conferred; and C, a general training for men who, perhaps without the intention of turning their knowledge to account, wished to know something of the art of architecture. Continuing, Mr. Jackson observed that too much stress was laid upon the necessity for general culture. General culture was one thing, and architectural education quite another. English architects sometimes, in the manner of the Americans, went to a University, and afterwards applied themselves to the study of architecture. In the first instance, however, he thought it was mixing up two distinct things to try, by a fictitious pretension, to give what was deemed necessary for the students' general cultivation. Class B, it appeared, was more exclusively professional and less of the character of a liberal education. He was the last to deplore general culture. The more the knowledge the greater the usefulness. General culture could never make a man an artist. If they looked at the careers of many of the greatest artists they would find that in a large number of instances they had risen from the ranks. And the same applied to architects. If he was not mistaken, many philosophers were slaves. And when they came to look at the masterpieces of mediæval art, they would find that they were the productions mostly of illiterate men. By attaching such great importance to a scheme of general culture, they were doing no good. They might look, he thought, for better architects among the men with no scholastic decoration. There appeared also to be more stress laid upon mere technicalities than on design. He confessed that his own mathematics did not go beyond the first four rules. People had considerately prepared excellent tables which were quite sufficient for the purpose when mathematics were in demand. Any matter referring to, for instance, heating, ventilation, drainage, or electric lighting should be exclusively the province of the engineer. These matters were so much beyond architectural training, that probably if the architect attended to them himself they would be done very badly. It was not necessary, therefore, to go to the extent which the curriculum imposed. They all realised the difficulty of the American students; they had no old buildings in their own country. Although it was true that all styles were essentially developed from the old ones, and that no style ever came into the world fully equipped, it had often occurred to him that the Americans had valuable opportunities to shut the book of the old country, with its catalogue of examples, and to attempt to evolve a style free from the influence that the study of old work must necessarily hold. It had given him great pleasure to listen to the very interesting lecture of Professor Hamlin.

Mr. Reginald Blomfield observed that it showed how important this matter had become, when Mr. Jackson came down and gave them the benefit of his opinions on educational matters. They had it on the authority of Ictinus, he believed, that in the middle ages architects were extremely well educated men. Regarding the distinction between general and technical education, he believed that in America the former was of necessity preliminary to the latter. This involved a practical point. He personally would infinitely prefer to have in his office the man who had gone through the schools. The well-trained mind was preferable to the ill-trained. The American system of education was unquestionably based upon the Ecole des Beaux Arts. The Blondel method was, if they troubled to examine it, on all fours with that of Professor Hamlin. In times gone by more importance had been attached to draughtsmanship than to architecture. Apprenticeship had not, he believed, taken well in America. The training in an architect's office afforded by the sytem of apprenticeship, was, he thought, going out of fashion even in this country. He would sacrifice the training to be gained in schools rather than give up the training of the office. Concluding, Mr. Blomfield said that he seriously doubted whether England would ever be able to build up systematic architectural education as France had done, and as America would undoubtedly do.

Mr. John W. Simpson said that the delightful task of proposing the vote of thanks to Professor Hamlin had fallen to him. All art, he proceeded, was founded upon tradition. The difference between a race with established schools, and one without them was, that the former learnt by tradition, and the latter fought for itself. Professor Hamlin's regard for the year 1866 as of much antiquity reminded him of what a lady had recently said—the youthfulness of the Americans was one of their oldest traditions.

Professor C. H. Reilly observed that he had had the pleasure of visiting the schools of America during his recent visit, and he had been greatly impressed by what he had seen. What had struck him most of all was the enormous improvement of American architecture during the last decade. At Cornell University he had been surprised to find students working at 10 o'clock at night, and obviously engrossed in their work. These same students were in attendance at a lecture delivered at 7 o'clock the next morning. Mr. Reilly accounted for students' enthusiasm by the fact that opportunities were afforded them of carrying out monumental architecture.

Mr. H. H. Statham said that in the old Colonial houses they saw the classic style transformed by the influence of timber. In the modern work he had felt for a long time that there was far too much Ecole des Beaux Arts. For many years he had been in the habit of going to the Salon, and it always seemed to him that they had all Ecole, with but little or no individuality. He personally had no mathematics; and he regretted the want every day. When they came to details, such as drainage, electric lighting, etc., they should, he thought, know sufficient of the principles to tell whether they got the right thing.

Professor Elsey Smith said he wished to tell Professor Hamlin that they did not all agree with the sentiments of some of the previous speakers with regard to general education. Columbia University undoubtedly took the lead by insisting that all its students should go through a two years' course of general culture. In no country, with the exception, perhaps, of Germany, was education so well understood as in America; and he was quite willing to confess that he agreed to every point in the curriculum which the students were to follow. He hoped to see students entering for a course of study for four years instead of for two, as now.

Professor Hamlin, responding to the vote of thanks, said that he did not think the respective problems of education had been muddled. The two years' general education were required before the actual process of education in the profession of architecture began. It had been said that general culture would never make an artist. Perhaps so; but the man who had artistic fire in him would be immeasurably the better by his culture, and would make an infinitely better architect than the man who, deprived of that culture, possessed but ordinary training. In New York, mathematics were rendered a necessity by the new forms of high building. Architects had new problems to solve, to prepare adequately for excessive wind pressure; and a knowledge of mathematics was the only safeguard. These problems would sooner be trusted to men with a diploma than to men with a certificate, for solution. Englishmen took to themselves, somewhat selfishly, the traditions of the past, and expected a new land to perform impossibilities. Would they remember Shakespeare was as much theirs as ours; that precedent was as much theirs as ours? It was inherited in the blood, and could no more be ignored than could the language. It was impossible to produce architecture without tradition. No architecture could ever be created of itself.' Their resolve was not to be slaves to precedent, but to awake to the opportunities afforded by a new land. He very heartily thanked them for their kind reception of a brother from across the sea.

Messrs. Smith, Major, and Stevens, Ltd., have just been instructed by the Lords Commissioners of the Admiralty to supply and erect on board the new Dreadnought Battleship, H.M.S. "Neptune," four of their electric passenger lifts, the order having been obtained after an exhaustive enquiry into the merits of the lifts in question.

* * *

A lecture on "The Story of Fountains Abbey" was given at the Leeds Institute by Mr. Thomas W. Thornton, who lamented that so little was known of the craftsmen who built the great cathedrals and abbeys of churches of the great Gothic period. It was true, he said, that the buildings were devised by master-minds, but the details were carried out by men who knew their craft, who were not mere machine-minders, but men with minds to conceive and ability to construct the beautiful fabrics which, after eight centuries, were still the admiration of mankind.

NOTES ON DECORATION.

By Arthur Seymour Jennings.

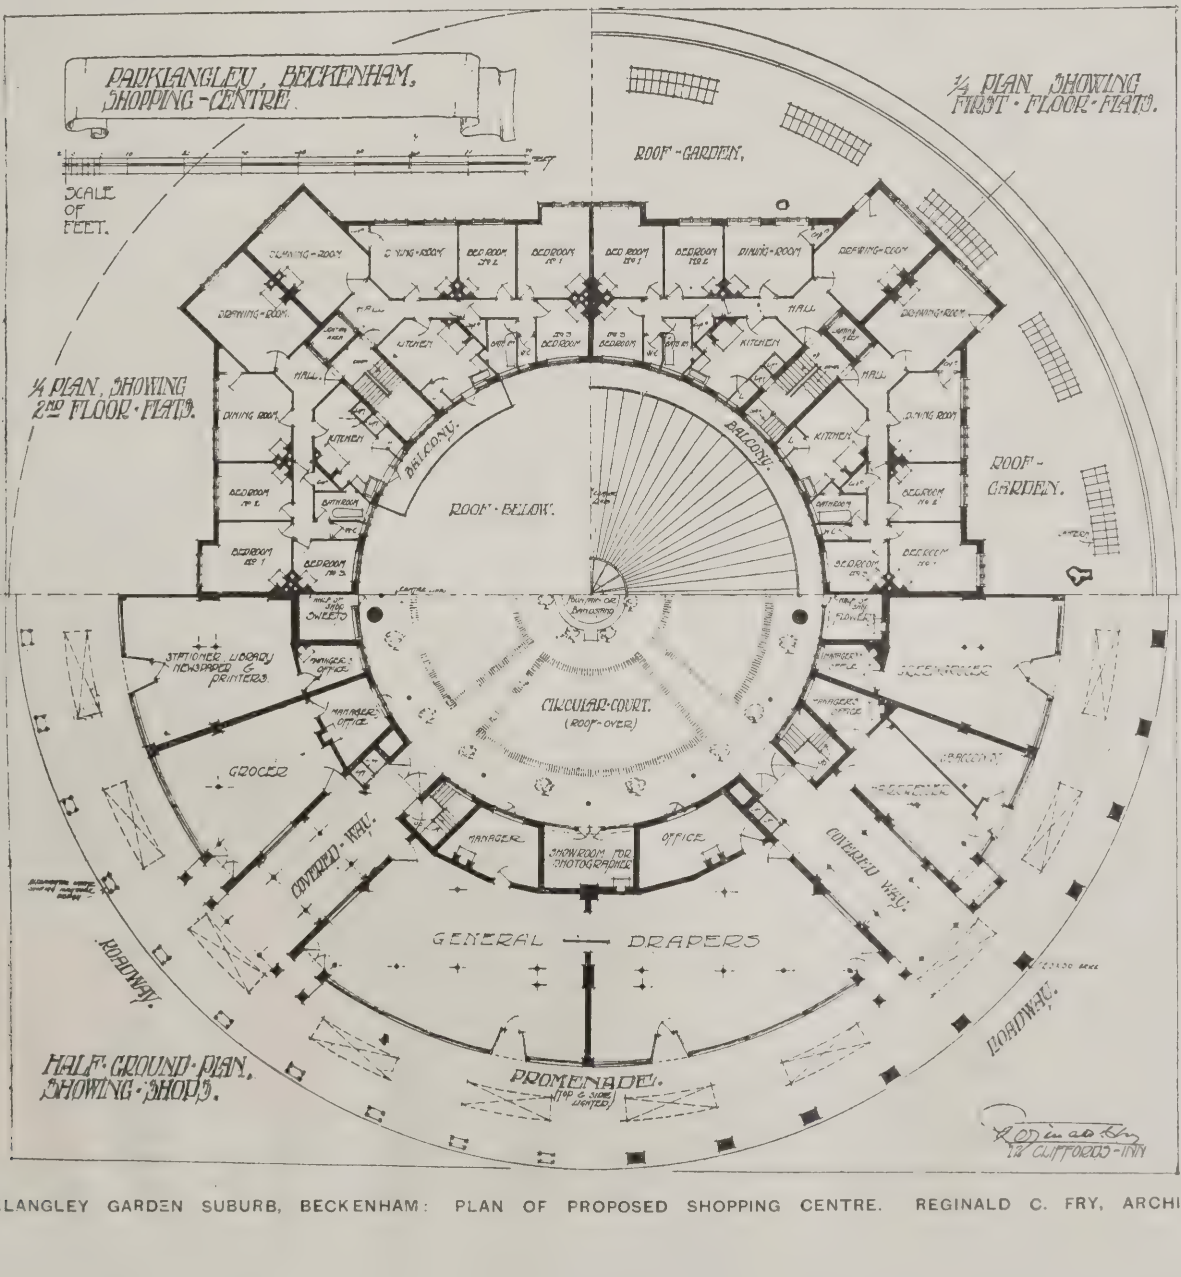
A question which often arises among architects and builders is as to how varnish may be practically tested with a view of discovering its probable durability. Some people seem to imagine that analysis will give important data upon which to work, but this is entirely a mistake. Analysis in the case of paints, if properly read, will yield facts upon which one can determine to some extent the probability of the paint lasting when exposed to the elements. But in the case of varnish analysis is almost useless, excepting that it may indicate the presence of resin, but this can be ascertained without the use of chemistry at all. If a varnished surface when dry is kept wet for a few hours, white milky spots will appear if the varnish contains resin. The usual and simplest plan is to charge a sponge with water and allow it to remain on the varnish surface overnight.

How, then, it will be asked, can one test varnishes? Is there no plan by which at least some reasonable probability of the lasting value of the sample may be ascertained?

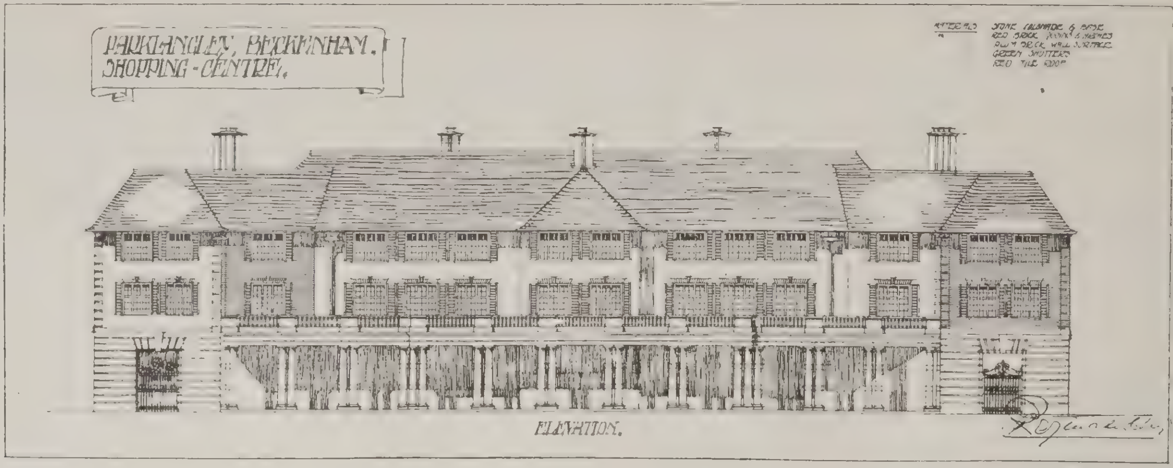
The answer is, yes, with a reservation that there is no method which can be looked upon as absolutely accurate. Of course, the price at which a varnish is sold or the name of the manufacturer in ordinary practice should satisfy one to a great extent as to what the quality of a varnish is likely to be. But we will assume that say ten samples of oil varnishes are submitted to test without any indication as to their value, or to the name of their manufacturer. We will assume, further, that they are put up in small bottles. In such a case the first thing to be done would be to examine each varnish for clearness. This does not mean colour, as a light varnish is only more valuable than a dark one when it is to be applied over light work. In other cases the lightness or darkness is not important. In examining, however, the ten samples, we shall probably find that two or three of them will be more or less cloudy or torpid, and these should be rejected, as in all probability they had not been properly tanked, and stored.

And here it may be useful to break off from our experiments for a moment to consider what a varnish is. By "varnish" is meant one prepared from oil or turpentine, and not a spirit varnish. Ordinary oil varnishes are made by dissolving with aid of heat certain resins or gum resins in linseed oil. The essentials are that they shall be in sufficiently liquid form to admit of application by means of an ordinary brush, that they shall dry hard and lustrous, and that the brilliancy shall remain more or less permanent. The actual resins, or gums, as they are frequently called, employed vary very largely in character, the hardest being such gums as Zanzibar, copal, the medium such gums as Kauri, and the soft those obtained from Brazil, Borneo, and other parts. Frequently, a mixture of gums is effected. But without going into the technology of varnish manufacture, it should be explained that in the case of every oil varnish, it is essential that the product be kept for a considerable time, say one or two years at least, in a tank placed in a room, which is kept night and day at a uniform temperature. This has the effect of causing the "foots" or impurities to settle to the bottom, and the varnish being drawn off at some distance up the tank, the foots or sediment are left at the bottom, and are afterwards drawn off for other purposes. The maturing of varnish in this manner has unquestionably a very material bearing upon its brilliancy and durability, but as obviously it locks up a good deal of money, there are not a few varnishes placed on the market which are so new that they quickly perish. There are no recorded experiments of any very definite nature that bear on this interesting part of varnish making and varnishing, but it may be taken as a broad fact that even a well-made varnish produced from copal is not so durable as one which is made of slightly inferior materials, but which has been thoroughly well matured. New wine, new whisky, and new varnish are therefore to be severely left alone.

To return to our experiments. It is always advisable in testing all kinds of materials to endeavour as far as possible to reproduce the conditions which exist in the actual work for which those materials are intended. Assuming that we have six good clear samples to test, one against the other, the following plan may be carried out. Take a ten-inch board,



PARKLANGLEY GARDEN SUBURB, BECKENHAM: PLAN OF PROPOSED SHOPPING CENTRE. REGINALD C. FRY, ARCHITECT.



PARKLANGLEY GARDEN SUBURB: ALTERNATIVE ELEVATION FOR PROPOSED SHOPPING CENTRE. REGINALD C. FRY, ARCHITECT.

say six feet long, mark off a space three inches wide from end to end, and divide the remainder of the board into six equal parts. Number each of them one, two, three, and so on. Then number each bottle with corresponding numerals. Prime and paint the board with three coats, omitting red lead altogether, as this is very destructive to even the best varnish. Take care to rub down carefully between each coat, so that the finished surface is quite smooth and clean. If the divisions have become obliterated it will be necessary to mark them in pencil again on the finished surface. Now obtain a sample of a really first-class varnish of some well-known maker, paying at least a guinea a gallon for it, and varnish the surface of the three-inch space which runs from end to end. Then varnish each space separately with number one, number two, and so on, taking care, of course, not to mix the samples. The usual plan in making these tests is to place the board on a table or bench, but this is perhaps a little misleading, as most work that is varnished is in an upright position, such, for example, as the case of a door, and it is better to place a board leaning against a wall so as to reproduce the actual condition of varnishing as nearly as possible. This work should be done in a room free from dust, and one heated at about 60 degs. F. A dry day is the most favourable for success. At the end of two or three days all of the varnishes should have dried quite hard, but it will be useful between to note the actual condition of each, so as to ascertain which is the quickest and which is the slowest drier. Speaking generally, it may be said that the quicker a varnish dries the less durable it is likely to be. But this rule must not be enforced too rigidly. When dry, the various specimens should be scratched across, when the toughness, hardness, and brittleness will become to some extent apparent. If the surface breaks up under the scratch of a sharp point with a ragged, uneven edge, the varnish is probably poor. If it gives an even and firm scratch the probability is that it is good. In other words, the varnish should almost scratch like one would expect a tough piece of leather would do. The different results obtained by scratching the different samples of varnish, as compared with the standard, will yield a good deal of valuable information as regards the relative qualities of the different samples. Possibly the reader has at hand one of the cheap roll-top American desks. Let him scratch this, and he will almost always find that the surface is very brittle and the scratch ragged, the reason being that cheap resin varnish is usually employed for these desks.

Professor A. P. Laurie, the Principal of Heriot-Watt College at Edinburgh, some time since patented an apparatus for testing varnishes, which consists simply of an appliance for scratching. It comprises a blunt point, which is pressed down upon the dried film of varnish to be tested, the pressure being regulated by means of a spring and a screw. The varish in this case is applied to the surface of glass, and the scratches give valuable information concerning the qualities of the different varnishes experimented with.

Of course, the very best test that can be applied is that of actual exposure, and a board with its six samples and its standard, making the seventh, after being scratched in the manner described, should be exposed by being nailed to a wall. If a careful record is kept of the condition, say at the end of each month, for two or three years, of the different samples as to their brilliancy, we shall have some useful facts upon which to work. In a London atmosphere the soot and dirt accumulate so quickly that it is advisable on each occasion when examining the samples to lightly wash down the surface with a chamois leather dipped in lukewarm water, and then to lightly polish with a dry chamois leather. If architects, painters, and builders would only take the trouble to make such experiments as those above described, they would find it of considerable service to themselves as well as to their clients and customers.

HOW TO PREVENT ACCIDENTS.

For the prevention of accidents, a builder is almost entirely in the hands of his foreman. Some foremen are considered "lucky" because no serious disaster happens on works under their control. It is probable, however, that luck has little to do with their good record, which is really based on their more complete understanding as to what constitutes danger and dangerous procedure. Believing that the extension of such knowledge would be a boon to the trade, we purpose giving from time to time an account of a typical accident with suggested means of prevention.

A flooring of steel joists had been fixed but not filled in. The workmen to cross it had a run laid two boards wide. It was shaped as the letter T. In other places floor boards were laid loosely, and in some cases singly. One of these was placed close to an angle formed by the run (see illustration). A workman using the run with a load, found his way impeded by a stanchion. He incautiously stepped from the run on to the loose flooring board, which broke under him, and he fell.

Rule.—Runs should be of sufficient width and well defined.

Skylights in roofs are a regular source of danger to workmen engaged in their repair. This is increased in such cases where the premises are old and the framework of the light is of wood. Three typical accidents will illustrate the dangers.

The first happened to a man who was repairing a zinc guttering at the bottom of the light. He was confined as to space and incautiously placed one foot on the light. It gave way and he fell and was killed.

The second accident occurred to a man who was reputtying the sash. He used one board for support. It slipped, throwing him on to the light, through which he went and was fatally injured.

The third case was somewhat different. The man was proceeding to his work by way of a duck run when he tripped, and the skylight on which he fell, failed to support him. Fortunately the result was not fatal.

Rule. Skylights being generally of light construction, should be sufficiently boarded over when near to men who are working or passing to their work.

Painters' trestles and steps at all times form insecure supports to carry boards for men to work from.

The danger is added to when the trestles or steps are improperly fixed. Often this is difficult, as, for instance, when they stand on landings or stairs. Compared with their height, the area of the base is often small, and the work of a painter or plasterer generally necessitates the use of some force which tends to overturn them.

A fatal accident is known which occurred from this cause. On two quarter-space landings with a short flight of steps between them, two pairs of steps were stood to carry the necessary boards. They were not opened out, but leant against the wall. The man on the platform in his work pushed one pair of steps over and he fell.

Rule. When the trestles or steps cannot be fully opened out to give the most secure base, they should be fixed at the top or otherwise prevented from moving.

Proposed New Works.

ABERDEEN.—It is proposed to erect a new theatre at the corner of Carmelite and Guild Streets, Aberdeen. The decoration is to be carried out in fibrous plaster, and the outside mason work will be in granite.

BALLYMONEY, IRELAND.—The Town Council have received a letter from the General Post Office, London, stating that, although there are several difficulties to be overcome, there is every probability of the proposal to build a new post office being carried into effect.

BOURNEMOUTH.—A L.G.Board enquiry has been held at Bournemouth into the application of the Town Council to borrow £77,000 for the erection of a pavilion, reading, and assembly rooms, etc., on the site of the Belle Vue and Pier Hotel, and upon land forming part of the Central Pleasure Gardens. In a letter to the L.G. Board, the local residents' Association submit that the Council should curtail expenditure.

BURY.—A L.G. Board enquiry was recently held into the application of the Corporation to borrow £15,500 for the purpose of a scheme for the erection of working-class dwellings. It is proposed to erect fifty-two houses to let at rents ranging from 4s. 4d. to 6s. 3d. per week. Evidence was given to the effect that at present there were only two working-class houses in Bury unoccupied, and that the proposed scheme would do away with overcrowding. The Master Builders' Association contended that they could meet the demand if given the same terms as the Corporation by the ground landlord.

DERBY.—An application has been made to the Derby licensing justices for a music and dancing licence for the proposed Hippodrome at the corner of Green Lane and Macklin Street, the plans of which have been approved by the Improvement and Construction Committee of the Corporation. The building, which is estimated to cost £15,000, will have accommodation for 1,900 persons. An advantage to the town will be in the widening of Macklin Street, as the promoters are giving up land to the value of £1,000 for that purpose. The decision has been deferred.

DUBLIN.—The Chief Engineering Inspector to the L.G.B. has held an enquiry relative to the proposal of the City Council to reduce the rents charged in respect of stalls in the Iveagh Market, Francis Street. The enquiry was also concerned with the application of the Corporation for sanction of the following loans:—1, £8,200 for the completion of the Bride's Alley area scheme under the Housing of the Working Classes Act and 2, £10,000 for the widening and repairing of Annesley Bridge.

EDINBURGH.—In the City Chambers, Edinburgh, recently, a private meeting of ladies and gentlemen was held, under the chairmanship of the Lord Provost, to consider a proposal to establish in Edinburgh a hospital for the treatment of diseases peculiar to women. A vote taken at the conclusion of the meeting was unanimously in favour of the scheme.

HARROGATE.—It is proposed to erect a new hydropathic establishment on the St. James's Park estate. The dining-room, it is estimated, will seat 300 people, and besides this there will be a smaller one for use in winter, together with drawing, reading, billiard, and recreation rooms, and a large lounge in the centre of the building. The main frontage will be to the south and the entrance at the north side of the building, which will extend some 350ft. Baths of an up-to-date character will be erected in the basement, and include Turkish, Russian, and plunge baths, and electrical facilities. The men servants of the establishment will also have accommodation here, and an up-to-date laundry and other conveniences will be provided. The grounds will be elaborately laid out by Messrs. Cheal and Sons, of Crawley and London, and a terrace will grace the south frontage of a considerable width. Mr. S. Stead, of Harrogate (late borough surveyor) is the architect.

HENGOED.—A L.G.B. enquiry has been held here to enquire into the application of the Gelligaer U.D. Council for a loan of £11,408 to erect an isolation hospital.

HOUNSLOW.—In a competitive scheme for a proposed new undenominational church and schools at Hounslow, the designs submitted by Mr. J. W. Winter, St. Peter's Close, Sheffield, have been selected. Mr. Winter has received instructions to supervise the erection of the buildings in accordance with his plans and quantities. About a dozen London architects competed. The scheme is estimated to cost about £3,000.

INVERURIE.—A new Carnegie library is to be built here from the designs of Mr. Maclennan, of Messrs. Jenkins and Marr.

LEEDS.—At a recent meeting of the City Council, it was decided definitely to reject the Quarry Hill site for the proposed Smithfield Hall.

LOFTUS. The North Riding Education Committee are proposing to erect a new school here; but this scheme is being strongly opposed by the ratepayers of Liverton, who ask that the school at Liverton Mines shall be extended.

WATERFOOT.—An inspector of the L.G. Board has conducted an enquiry at the Municipal Offices, Rawtenstall, relative to an application by Rawtenstall Town Council for permission to borrow £1,500 for the purpose of re-constructing Waterfoot Market.

YORK.—A L.G. Board enquiry has been held into an application by the Corporation to borrow £25,250 for the purposes of a new street proposed to be made from Pavement to Piccadilly, and to include a steel girder bridge over the river Foss. The new street is designed to give better access to the city from the Hull Road and Fishergate districts, and to relieve the congestion in Fossgate and Walmgate. The scheme has already been authorised under a Provisional Order, and sanction obtained for the purchase of part of the property. The present application includes the estimated cost of the remainder of the property and of the bridge and street works.

Our Plate.

In our issue of October 27, we gave a short account and some illustrations showing the new garden suburb rapidly springing up near Beckenham, and known as "Parklangley," Kent. We now show its remarkable shopping centre and the general lay of the roads.

The plan clearly shows one-half of the circle of shops, while the other two quarter-segment give one-quarter of the first and second floors. It will be noticed that in shape it is a hollow circle surrounding a covered court yard. On the outer side, immediately within the piers, is the promenade, some 15ft. in width, covered in above, ample light being admitted through the lantern lights above. The shop fronts are ranged on the inner side of this walk, and so in the worst weather the shopping duties or pleasures would be possible in comfort. The circular courtyard is reached through four covered ways running out to the points of the compass. The centre of this courtyard will be occupied by a bandstand or fountain, while palms or ferns will be arranged around so as to give the appearance of a winter garden. Some of the shops will have their fronts facing this winter garden—photographs and pictures, sweets, fancy goods and tea shops. Probably tea would be served in this winter garden. A few of the trades, such as butcher, baker, motor and cycleman, fishmonger, oilman, ironmonger, would be ranged outside the shopping area, as some of them require workshops attendant upon them, while others carry on a class of trade which would not be suited to the shopping area.

The general lay-out of the estate has been governed by several things—first, by the magnificent avenue of trees which runs from east to west; secondly, a sewer put in some years ago by the Council; thirdly, the retaining of the old manor house, and fourthly by a road laid down some years back, taking an extraordinary line without apparent rhyme or reason. These were the difficulties which faced Messrs. H. and G. Taylors, the owners, and they called in Mr. Reginald C. Fry, who, after many attempts, drew up a plan with its basis that of Napoleon's grand conception of Paris, save that instead of making his axis a triumphal arch, he made his radiating roads and broad avenues converge on two centres for shopping. In a later plan one of these was given up, and revised more upon economic lines, and the southern shopping centre gave place to a church site.

NOTES ON REINFORCED CONCRETE CONSTRUCTION.*

By Professor Stephen M. Dixon (University of Birmingham).

At no time in the history of architecture has the position of young architects been more interesting than at present. The possibilities of reinforced concrete are as yet realised only by a few. The adaptability of the material to various kinds of structures is most wonderful, and the architect has now an opportunity to show his appreciation of this combination of materials. For the last few years English architects and engineers with proverbial caution have been watching and criticising the work of others in reinforced concrete. *Festina lente* is doubtless a wise maxim to follow at certain times, but we must not be so cautious as to stand still; and just at present we find that we are left far behind by Continental and American architects in making use of reinforced concrete in all kinds of buildings. Many fine opportunities are waiting the enthusiastic architect who, with an accurate knowledge of the materials separately, and of their behaviour when combined together, has the courage to put his knowledge to the test and build in the new material.

I should have said neglected, instead of new material, for it is more than 50 years since reinforced concrete was first used in England. For many years iron embedded in concrete has been used in foundations, and it is a long time since the first concrete and iron roofs were erected; but till recently, except in foundations, the combination of the materials has been little used. To avoid being misunderstood, I should point out that though much excellent use has been made by several architects of reinforced concrete as a substitute for other materials, still, in general, its properties are not at all fully appreciated, and its use at present rarely modifies the form of a building.

If the architect is to use the material with most effect, he must make a particular study of its properties himself. Calling in the services of a "calculating man" to do the steel and reinforced concrete work may save a lot of trouble, but the ultimate effect is sure to be disappointing. The architect who has formerly learned to express his ideas in timber, stone, or brickwork, must now learn the possibilities of construction in reinforced concrete. Up to the present the material, where it has been used, has been merely substituted in the unseen and frequently neglected parts of a building, and in the majority of cases it would need a skiagraph taken by an X-ray apparatus to tell us that the buildings in question were just steel and concrete skeletons covered by stone masonry. I know that this is often defended in principle as following an example set by the older Italian architects, who covered many of their brick structures with marble; but a little reflection will soon show that the cases are not similar. If structures of timber present features characteristic of the material, which characteristics we should not imitate in masonry, so structures of reinforced concrete should be distinguished by their form from those of masonry.

It is generally easier for us to recognise the faults of previous generations; the magnificent timber arch by Wickeling at Bamberg was disfigured by timber facing representing arch quoins. In the same way, just at present owing to natural conservatism, or, rather, to the imitative instincts, which are unfortunately shared by architects and engineers, the great buildings in reinforced concrete in this country are covered by masonry. It seems as if the real characteristics of the material, strength and lightness, do not appeal to the designers of these structures, which in their exterior at least imitate masonry. For this reason pictures taken during the construction of the few great reinforced concrete structures in England are more interesting, at least to the engineer, than pictures of the finished work.

There is no doubt that this method of building proceeds along the line of least resistance, and the architect incidentally escapes a lot of lay criticism. For, in general, in this country we like those things to which we have grown accustomed, and heavy masonry gives an idea of solidity and durability which must be pleasing to many, if the hideous monstrosities to be seen in cemeteries mean anything.

On the other hand, there will always be found a few who, appreciating to the full the wonderful qualities of the material, are led into what the more sedate consider fantastic extremes. The structures erected by these enthusiasts will at least have the merit of demonstrating the possibilities of reinforced concrete work, and will doubtless point the way to what will ultimately become a characteristic style in buildings of this material.

Many causes have delayed progress in reinforced concrete construction, and foremost among them may be placed the building regulations of various municipalities. The regulations referring to reinforced concrete are frequently harmful if not merely inefficient. But, owing partly to a kind of reaction, partly to the enthusiasm of a few experts, and especially to the energy and business enterprise of various construction companies, we find just now numerous projects for reinforced concrete work.

If the architect requires a knowledge of the properties of the materials in order to adopt this method of construction, he also needs it if, with a view to saving himself trouble, he hands over the concrete work to a special firm of engineers or contractors. For, if he be satisfied to erect what seems to him an artistic shell concealing an ugly, though necessary skeleton of reinforced concrete work, how is he to choose his engineer and satisfy himself that of the innumerable so-called systems he is selecting one that is not only sound, but best suited in every way to the design in hand? Division of labour is all very well, but a truly artistic structure should show to those capable of criticising it that there is a perfect harmony between its various parts such as can rarely exist unless one mind has been responsible for the complete design. I know that objections are made to the use of the word artistic, but I must use it, and shall venture to apply it to some engineering structures and defend its use; for it is perhaps allowable to call that structure artistic which, in the opinion of those competent to judge, will satisfy Dürer's criterion quoted by Ruskin: "This for what it has to do, and the way it does it, cannot be excelled."

I have no doubt that one reason why even still so few large buildings have been erected in reinforced concrete in this country is that many of those who have already designed great works in stone and brick recognise that for the proper development of structures of the new material great changes in design will be required, and therefore they hesitate to undertake schemes which might lead them much further than they are prepared to go. Some are satisfied to leave reinforced concrete alone, saying, perhaps, that it is an untried material, and not at all suited to artistic requirements; while others may use a few steel joists in concrete in the foundations, so that, with the materials safely out of sight, they can claim to be thoroughly up to date, and yet, at the same time, proceed generally by old established methods in stone, brick, and timber.

But the younger architects must be prepared to adopt the new materials in no half-hearted way, or expect to be called to defend vigorously their neglect of them, and so a careful study of the properties of the combination is essential in either case.

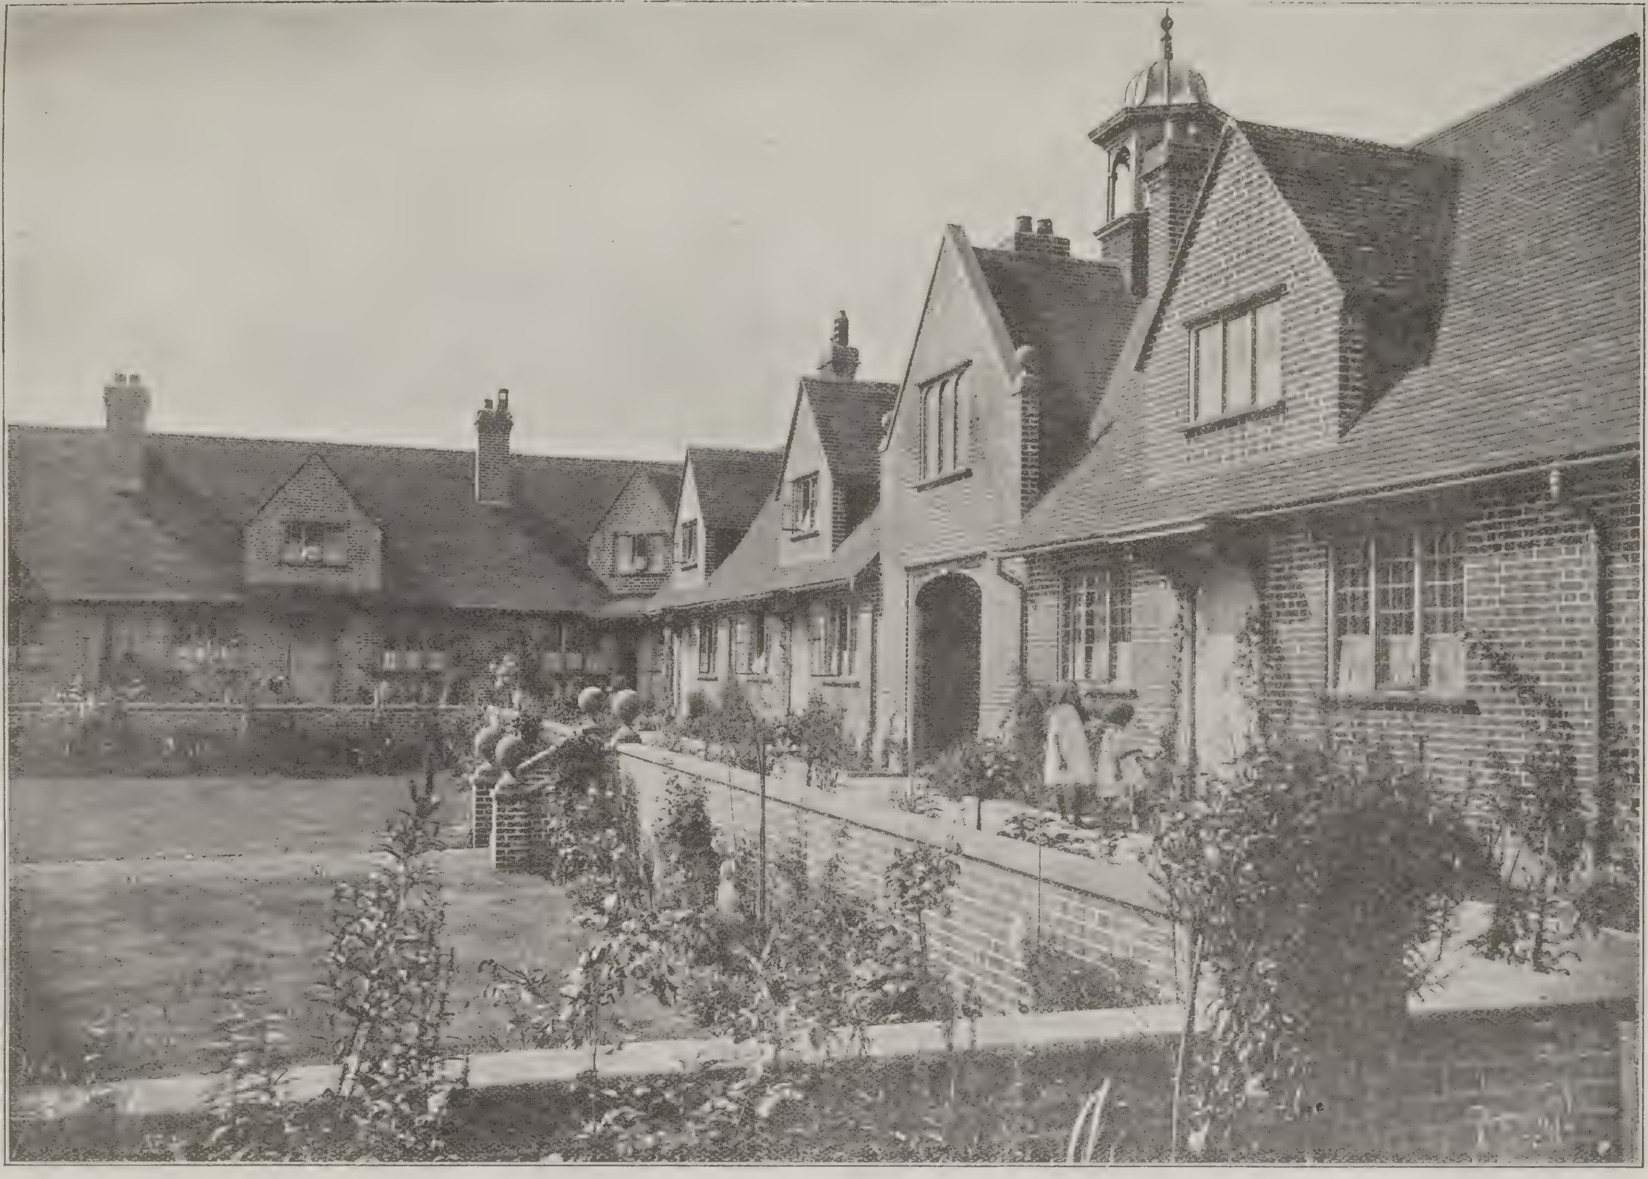
It is frequently said that reinforced concrete is an impossible material from the artistic standpoint, and so must be used only in floors and foundations and other places out of sight. The strength of this combination of materials is severely criticised when some modern structure fails during erection. We are told that owing to its recent introduction we are utterly unable to say whether it is really durable, and that such great care is needed during its construction, and such strict supervision required that either the cost becomes excessive, or that dangerous flaws may be concealed. Again, many in a general way say that they dislike the idea of trying to combine two such different materials as steel and concrete, that much more experience is needed, and that further experiments should be made before this method of construction is adopted. Lastly, the more exact objectors ask definite questions: Is the steel embedded in the concrete subject to corrosion? Will this construction stand shock, vibration, and changes of temperature on a moderate scale, and in extreme cases resist the effects of fire and earthquake?

Taking these objections in the order given, we may first glance at the extremely interesting point as to whether the material is satisfactory from an artistic point of view. Let us for a moment contrast some typical works in masonry, or even steel, with similar structures in reinforced concrete, and I am afraid that in condemning the more recent structures we shall be inclined to blame the material. But is this fair? In the majority of cases all the possibilities of reinforced concrete have not been considered in reference to the problems to be solved, and so structures are presented which are merely copies of masonry or steel structures instead of being worked out on their own lines. To illustrate this point, pictures showing the Bridge of Sighs, Bridge of St. Angelo, and some heavy masonry arches on the Canadian Pacific Railway were put on the screen; and in the latter was noticed particularly the massiveness so characteristic of most stone structures. Again, the steel arches as shown in some further slides, would surely be judged artistic when tried by Dürer's criterion; and the suspension bridge as one of its best examples is generally pleasing. Such structures may be considered as types combining lightness and strength. Now, contrast with these a few unfortunate examples of reinforced concrete bridges, which examples are chosen from our own neighbourhood—the United States and Spain. In the first of these the designers seem to have had plate girders in their mind (I had almost said on the brain), and in the last a timber trestle bridge, but in no case is the result judged from any point artistic. But that good results may be obtained when a skilful designer is not afraid to use the materials to the best advantage, will be seen by looking at the magnificent Walnut Creek bridge at Philadelphia, where a fine span has been made possible by connecting two arch ribs by a reinforced concrete floor. Concrete is often condemned on account of surface appearances. This unsatisfactory condition is because too few architects and engineers in this country have yet paid attention to the finishing of the concrete surface. Engineers in England are generally satisfied with the surface just as the shuttering, very often roughly put together, leaves it, whereas few materials present such fine opportunities for effects, which may be obtained either by treatment of the surface finish or by colour.

About the strength of reinforced concrete work properly designed and executed with care, there can be no doubt. One of the most remarkable tests ever made on an engineering structure was carried out on an experimental arch built on the Monier system in 1890. In this system, practically the first adopted, the reinforcement consists of a wire mesh near the soffit of the arch, and this method might be more frequently used in the roofs of great buildings. The test arch was built with a span of 32.8ft., a rise of 3.28ft., and a width of 13ft. The depth at the crown was only 6ins. The reinforcement was a net of iron wire, .39in. and .28in. diam., placed about 3ins. centres and 2ins. from the soffit. The following tests were made: first a locomotive weighing 40 tons

---

*Substance of paper read before the Birmingham Architectural Association.



THE CHURCHILL COTTAGE HOMES, CHEDDAR VALLEY, SOMERSET. SILCOCK AND REAY, F.R.I.B.A., ARCHITECTS.

These houses are arranged on three sides of a quadrangle about 120 feet square. The fourth or south side is enclosed by a low brick terrace wall. The buildings are of red brick with woodwork in oak, and tiled roofs.

was placed on the crown, then it was run off, and a 53-ton locomotive was run over half the arch. Having stood these tests successfully, a dead load of 110 tons was piled on the half span; this was about 1,000lbs. per square foot, and the deflection was only .12in. When the load on the half span was gradually increased to 2,000lbs. per square foot, the arch failed, the abutments giving away.

When the more conservative members of our professions speak of the material as not having yet stood the test of time, I think we may still have every confidence in its durability. For, though we cannot say that it, like masonry, is as old as the hills, still, it is not exactly a mushroom growth, for we find examples in Roman architecture of reinforced concrete, which date back to the year 212. It is true that the reinforcing rods in these cases are of copper, and so for a true comparison we must show that iron or steel rods embedded in concrete are as durable as those of copper. This question will be noted later, but it may be mentioned here that Mr. Edwin Thatcher quotes the case of a bar of iron which, embedded in concrete, had remained 400 years under water, and was then found free from rust. But reinforced concrete as we understand it has been many years in use. The first patent recorded is that of W. B. Wilkinson in 1854, for hoop iron in concrete floors, the hoop iron being placed in the lower side, while in 1855, at the International Exhibition in Paris, L. J. Lambert exhibited a boat built of concrete and iron. In 1851 Coignet published a pamphlet in which he suggested using a metal reinforcement in concrete, while in 1866 Monier took out his patent; and his method has been used for the last 17 years for bridges in Switzerland, Austria, and Hungary. In North America Ransome first suggested reinforcing beams in 1882, and took out his first patent in 1884, and in 25 years the development has been so phenomenal that it is certainly unnecessary in the United States to speak of the advantages of this method. In fact, when we find buildings 16 and 17 storeys high quite common, and that frequently the materials used are only indifferently good, it is probable that words of caution rather than of encouragement are needed.

No one can deny that great care and supervision should be exercised in the construction of reinforced concrete buildings; but all structures which have been designed with due regard to economy of materials require to be erected with care, and the designer relies on good materials and good workmanship. Plain concrete and masonry also require supervision during construction; and we should remember that by introducing reinforcement we greatly reduce the amount of concrete needed, and so reduce the time of laying the concrete, and consequently the time of supervision. But in any case, the architect who builds in reinforced concrete acts as his own manufacturer, and having tested the raw materials, as it were, cement, sand, gravel, and steel, he proceeds to manufacture the concrete and place it in position round the steel by ordinary labour, and, of course, this labour must be superintended.

The general objections are often urged by those who have not given much thought to the subject. In a well-designed reinforced concrete beam, to take a typical example of the work, we are not trying to mix together two unlike substances, but we are making use of the special properties of two materials, concrete and steel, in the most advantageous way. And, moreover, the construction possesses the enormous advantage that when we enclose the steel in concrete we cover it with a perfect preservative. As is well known, the weak point in trying to preserve steel or iron from corrosion, by covering it with a mixture of oil and some pigment, is the necessity of having the surface clean and absolutely free from rust before applying the paint. When, on the other hand, we embed steel in cement mortar, it is found that the best results may be obtained even with rusted metal. In fact, many architects and engineers prefer to use rusted steel in their reinforced concrete work, since they claim that the iron oxide is readily converted into ferrite of calcium. Whatever may be the chemical action, the result is that if rusted steel or iron, having been embedded in concrete for some time, is then cut out, it will be found clean and bright.

If we look at the record of work successfully executed in Europe and America, it will be apparent to everyone that already a great deal of experience has been gained under most varied conditions. In fact, owing to the enthusiastic way reinforced concrete has been taken up in the United States, English architects start with the results of experiments made on a very large scale. In the way of experimental research, of course, much remains to be done; and co-operation between various architectural associations, engineering societies, and the universities is needed, so that the laboratory work may be carried out along the most useful lines. For, though an immense amount of this work has already been done at several of the large engineering schools in the United States, there is still much to be learned.

Now, for the definite questions we have definite and, I think, very satisfactory answers.

Steel thoroughly embedded in concrete is not subject to corrosion. Your attention has been called already to the fact that as a preservative for iron, concrete acts in such an excellent manner that many authorities believe there is actually a chemical reaction between the cement and the metal. But we have more direct evidence. Some reinforced concrete piles were driven in Southampton Water, and the tops having been cut off were thrown on the foreshore, where they were continually washed by the tides. After lying there for nine years, the concrete was broken open, and the embedded steel showed no signs of corrosion, though the protruding ends had rusted away. Mr. de Vesian mentions the case of some iron embedded in the concrete of a Paris sewer, which after 40 years was in a state of perfect preservation. That with care concrete can be made watertight, is now admitted, and many watertanks have now been built of reinforced concrete. At Frankley the service reservoir of our water supply is constructed with expanded metal and concrete, and in France the Coignet Company have built wine vats of concrete and steel. I think we may admit that this is a good test.

The steel, therefore, embedded in the concrete, not being subject to corrosion, if we can show the combination is not liable to deterioration owing to shock or vibration, we have a most durable material of construction. But there is much so-called reinforced concrete work which can have no such claim. Many builders, even when convinced that a new material should give satisfactory results, are content to use it merely as a substitute, instead of seeing that the designs are so modified as to get the best results from the material. For example, it frequently happens, in current practice, that reinforced slabs are substituted for flooring, and are supported on steel joists, while the ceiling hangs from the lower flanges of these joists in a similar way to lath and plaster work. This construction, though utilising the great strength of reinforced concrete, does not bring out all the good points, for by this arrangement the joists, clips, and fastenings are all subject to decay.

That reinforced concrete will stand shock and vibration to a wonderful degree, is shown in the successful driving of piles of this material, and also in the satisfactory state of the few railway bridges already built in concrete and steel.

Its resistance to stresses due to small changes of temperature is also remarkable. We know that the coefficients of expansion for temperature of cement and steel are very nearly the same, and experiment shows that very long walls of reinforced concrete can be built without expansion joints and without any visible cracking. The stadium at Harvard University has an outside wall 1,390 feet long, built in reinforced concrete, and notwithstanding the several changes of temperature to which it is subject, there are no apparent cracks. This is really an obscure question, and further experiment is needed, for while Considère holds that reinforced concrete can expand about 10 times as much as plain concrete without cracking, Turneaure and others state that such is not the case. It seems likely that the action of the reinforcement is to substitute for a large expansion crack an infinite number of microscopic cracks which, however, if they exist, have been shown to have no ill effects on the durability of the steel inside.

Under the more severe tests of fire and earthquake, the behaviour of reinforced concrete is quite exceptional. Concrete has long been used for fireproofing, and the only thing necessary is to give the concrete sufficient thickness to make it really protective. But always great care in the selection of materials and strict supervision is needed. In the report of the National Fire Protection Association, Chicago, May, 1906, we find: "We should like to emphasise the fact that a concrete building, even if designed along the most approved lines of present-day engineering, may be very good or very poor as to fire resistance, according as the selection of materials and execution of the entire work is intelligently and honestly carried out, or otherwise."

With regard to the resistance of structures of reinforced concrete to earthquake shock, the great earthquake of San Francisco gave conclusive evidence as to their satisfactory behaviour. A number of slides were shown, on which may be seen the damage done by the earthquake to the building of Stanford University. The shock at the University was much more severe than in the city, and the effects were not complicated by a subsequent fire. It could be seen that in every case the reinforced work stood well, while brick, stone, and plain concrete buildings collapsed.

To show the amount of hard treatment the material will stand, I might call your attention to a warehouse recently built in Tunis. When the building was completed, the foundations on one side gave way, and the whole block tilted over till it was inclined to the vertical at 25 degs. By excavating under the other side and loading it, the building was levelled, though, of course, now it stands several feet lower than originally designed.

I have tried to show that in reinforced concrete we have a material strong and durable, and therefore suitable for many architectural purposes, but I have said nothing of the many so-called systems of reinforced concrete work. Too much time has been already spent in developing these various systems, differing in many cases only in the minutest details from one another. What is needed is that architects and engineers having studied the principles of construction in it, both in theory and by experiment, should set to work to design structures in such a way that the special properties of the material may be used to the best advantage. We may note the advances made in the designs of retaining walls by comparing the designs of a typical gravity wall and of a reinforced concrete wall.

Up to the present too much copy work has been done. We have become so familiar with the advantages of steel and iron that much reinforced concrete is designed, as it were, to be erected in metal alone. Girders in this material have been developed to a very large extent, but in architecture I feel sure that the great success will lie in its use for arches and vaulting, while in many cases the cantilevers supporting galleries will be superseded by ribbed floors. [Slides showed some beautiful ribbed roofs erected by M. de Bandot in France; the arched roof and main girders and cantilevers of the New Theatre in Copenhagen, by Mr. Suenson; and the galleries of the Sidwell Street Church at Exeter, by Mr. Coles.] Through the kindness of the architects, I have been enabled to show these interesting structures.

We are at present in a transition period. Many of the new designs must be merely tentative, but to use architectural effect only to conceal the main structure, must be wrong. There are but two straightforward courses, either to ignore a durable, easily worked, and cheap material, a line of action which will seriously impede progress; or, accepting the material, to study its properties, so that in our designs we may use it to the best advantage.

Societies' Reports.

nburgh Architectural Association.

To the members of Edinburgh Architectural Association Mr. F. Morley Fletcher, director of the Edinburgh College of Arts, delivered a lecture in the Association's Rooms, George Street, Edinburgh, on "Materials and Treatment in Wall Decoration." Mr. Morley Fletcher inquired into the reasons of the lack of any great modern school of wall decoration that would bear comparison with those of the great masters of the past, and suggested that the conditions of our climate and national life called for a different character of decoration, or that the reason might be simply that a proper technical method had not yet been found that would satisfy the conditions imposed by our humid climate and the impure atmosphere of our cities. He stated certain established principles, and emphasised the principle that however elaborate the enrichment of a design might be the sense of illusion should never be given to an extent that would appear to destroy the flat surface of the wall. He described and compared the methods of modern decoration as shown in the decoration of the Pantheon in Paris, the Boston Library, the lunettes by Lord Leighton at South Kensington, and the decorations carried out in Edinburgh by Mrs. Traquair. Some examples of the modern revival of fresco painting were shown and criticised by the lecturer, who said their element of failure was their inability to resist the dangers of our climate by reason of their exposed surface, and their liability to decomposition owing to the acidity of a city atmosphere. He stated that Professor Church, in examining the exterior limestone of St. Paul's Cathedral, found the limestone to be changed to sulphate of lime to a depth of three-quarters of an inch by the action of sulphurous acid in air and rain. In recommending, as an experimental method, an impervious ground of zinc white, and the complete protection of the painted surface by means of varnish and a renewable coating of wax, as more suitable than fresco to our climate and conditions, Mr. Fletcher emphasised the necessity for retaining and using the luminous power of the wall and for avoiding loaded lights. Examples of classic work were shown and compared with modern work of various types, by means of lantern slides and other reproductions of wall decoration.

Leeds and Yorkshire Architectural Society.

At a meeting of the Leeds and Yorkshire Architectural Society, a paper on the "Life and Work of Cuthbert Brodrick" was read by Mr. Butler Wilson, and in the course of his paper Mr. Butler Wilson expressed the opinion that Leeds Town Hall was perhaps his greatest work, although he was the author of the designs for several other fine buildings, including the Wells House, at Ilkley, the Leeds Corn Exchange, the Hull Town Hall, and the Leeds Institute. He submitted his designs for the Leeds Town Hall in the competition which had been inaugurated by the Leeds Corporation in 1852, and he was then only twenty-nine years of age. The estimated cost of the execution of his plans was £41,835, but the actual building, when completed with the clock tower, cost some £122,000. In later years Brodrick was one of the architects commissioned by the national authority to submit designs for a National Gallery in Trafalgar Square, London. Mr. Butler Wilson dealt with his subject in a most interesting manner, and with great wealth of detail. It seemed strange, he said, that no one had ever thought it worth while to write Brodrick's biography. One rumour that he would especially like to contradict was that which had been circulated to the effect that Brodrick was a waster and that he died in poverty. This was entirely untrue. Brodrick was always in comfortable circumstances, and at his death left a respectable fortune. A number of lantern slides illustrative of Mr. Butler Wilson's paper and a collection of original drawings by Brodrick were shown.

Before the members of the Leeds and Yorkshire Architectural Society, at the society's rooms in Park Street, Leeds, a lecture on "An Unknown Italian City" was given by Mr. Martin Shaw Briggs (London and Otley). Mr. Briggs was recently appointed an Oxford Extension lecturer, Oxford University. The lecturer said his subject—Lecce—was the capital of the province forming the heel of Italy. This district was entirely neglected by tourists, and it was only by chance that he was enabled to visit it in the spring of 1907. On that occasion he was accompanied by Mr. Ralph W. Thorp (assistant hon. secretary to the society), whose excellent drawings had subsequently appeared in the "Architectural Review." He (the lecturer) found valuable material at Lecce, historical as well as architectural, and decided to write an illustrated monograph of the district under the title of "In the Heel of Italy." It was from the chapter of this work dealing specially with architecture that he drew the substance of his lecture. Mr. Briggs pointed out the influences at work in Italy, and especially in the southern portion of the country, which contributed to produce a remarkable architectural period in this remote city. Referring to the suitability of the term "baroque" as applied to the architecture of this period, he compared its characteristics in Lecce with those in better-known cities, and urged the rare charm of a complete "baroque" city. Examples of the middle of the sixteenth century architecture in Lecce varied from a comparatively pedantic type to an extravagance of grotesqueness far from pleasing, but in a later period a more settled style became noticeable, and it was to this epoch that the city owed the majority of its buildings. The lecture was illustrated by about thirty lantern slides, mostly of architectural interest, the majority of which had been prepared from the lecturer's own pen and ink drawings. Many of them illustrated beautiful palaces and street views characteristic of the city.

Glasgow Institute of Architects.

At a meeting of the Glasgow Institute of Architects (Associate Section) held in the Rooms, 39, Elmbank Crescent, Mr. William Sinclair delivered a lecture on "Ruskin on Architecture." Mr. Sinclair briefly sketched the rise of architecture, and defined its claim to be considered as one of the fine arts, also dealing with its influence on individual and national character. Thereafter, a detailed account was given of Ruskin's plea for a better understanding of Gothic architecture, and in particular its more common use in our domestic and our public buildings. Several passages were referred to in Ruskin's "Stones of Venice" and "Seven Lamps of Architecture" in support of the lecturer's contention that as a city Glasgow had not yet attained a very high ideal in domestic architecture, especially in the homes of the workers. At the close of his lecture Mr. Sinclair made reference to Ruskin's severe criticism of the restoration of historic buildings.

Northern Architectural Association.

At the second ordinary meeting of the session, held on December 8th, Mr. John W. Simpson read a paper entitled, "With Share and Mattock." In his introductory remarks Mr. Simpson said that words of Tennyson's "Northern Farmer." "I 'a' stubb'd Thurnaby waästes," suggested so well the quiet, dull task which architects have to accomplish that he commended to those present the merits of the ploughshare and the hoe. "There has been and still remains," continued Mr. Simpson, "much waste land to 'stub,' ungenerous ground rendering slow return to the courageous labour which is ever breaking it to husbandry and keeping down the growth of evil weeds." Then, likening the every-day business of the profession to "Thurnaby waäste" and the task of the Royal Institute and allied societies to its "stubbing," Mr. Simpson dealt with some of the multifarious duties with which the Institute is charged on behalf of the profession, and reminded his hearers that much of the work of the committees and of the Council is necessarily done in private, and because of its quiet success is no more heard of. In his concluding remarks Mr. Simpson said, The Royal Institute is not a trades union; it is not a weapon to use against our clients, but rather an instrument to encourage and confirm the confidence in us their advisers. The true question, then, for its members to ask, and indeed for all architects desiring more than their own selfish ends, is not, "What has the Institute done for me?" but, "What have I done for the Institute?"

The Junior Institution of Engineers.

With the permission of Mr. Maurice Fitzmaurice, C.M.G., Chief Engineer to the London County Council, a large party of members of this institution recently paid a visit of inspection, under the guidance of the resident engineer, Mr. E. H. Tabor, M.Inst.C.E., to the Embankment Wall Works for the New County Hall, Belvedere Road. The Hall is to be erected on land reclaimed from the River Thames. This area of about two acres will be enclosed by an embankment wall nearly 600ft. long, which is now being constructed. The new wall, which will be very similar to the Victoria Embankment on the opposite side of the river, is built of concrete, with a granite facing down to low-water level, and with a granite parapet. It is being constructed inside a cofferdam, consisting of a single row of 14-in. Oregon pine piles, which have been driven into the London clay, upon which stratum the wall itself will be founded. Behind the wall is a continuous concrete raft 5ft. thick, on which foundation the main building will be erected. A width of about 40ft. next to the Embankment wall will be vaulted, the top of the vaults being paved and forming a terrace. Special precautions have been taken at the end of the work next to Westminster Bridge in order to avoid disturbing the bridge foundations. With this object a caisson, 35ft. by 20ft., has been sunk by the compressed air process close to the abutment of the bridge, and this part of the wall founded upon it. At the conclusion of the visit, Mr. Percy Young (member of the Council) expressed the acknowledgements of the members for all the facilities which had been extended in connection with the occasion.

The Carpenters' Company.

The Worshipful Company of Carpenters announces another course of lectures, to be given during the early months of next year at the Carpenters' Hall, London Wall, E.C., on Wednesdays, at 7.30 p.m. The following is a list of the dates, lecturers, and subjects:—January 12th, Professor Beresford Pite, F.R.I.B.A., "What is Artistic Craftsmanship?"; January 19th, M. H. Baillie Scot, Esq., "The Art of Building, with special reference to the use and abuse of materials"; January 26th, Banister F. Fletcher, Esq., F.R.I.B.A., "The Carpenter's Craft"; February 2nd, Sir Brumwell Thomas, F.R.I.B.A., "The Joiner's Craft"; February 9th, Arthur Stratton, Esq., A.R.I.B.A., "Native Craftsmanship in Timber, Brick, and Stone before the 18th Century"; February 16th, Lawrence Weaver, Esq., F.S.A., "The Art of the Lead Worker"; February 23rd, George P. Bankart, Esq., "The Art of the Plasterer"; March 2nd, C. F. A. Voysey, Esq., "Castles in the Air"; March 9th, Halsey Ricardo, Esq., F.R.I.B.A., "The Use of Coloured Materials in Building"; March 16th, Professor G. E. Moira, "Mural Painting"; March 23rd, R. Anning Bell, Esq., R.W.S., "Coloured Reliefs and Mosaic"; March 30th, F. W. Pomeroy, Esq., A.R.A., "Sculpture as applied to buildings"; April 6th, Thackeray Turner, Esq., F.S.A., F.R.I.B.A., "The Craft of repairing buildings." Tickets of admission to the lectures can be obtained free, from Mr. J. H. Freeman, the Clerk, Carpenters' Hall, London Wall, E.C.

These lectures will, as before, in the first place, be for all craftsmen and those engaged in actual trades in connection with the constructive arts, but all of either sex and of any trade or profession are invited to attend. Admission will be free by ticket. The lectures will last about three-quarters of an hour, and at the close, questions on them may be asked. At the end of the course prizes will be offered as mentioned later, under the following conditions:—

(1) Only craftsmen or those engaged in the actual work of carpentry, joinery, or the other arts connected with building can compete. The successful competitors, if called upon so to do, must satisfy the judges in this respect, and should any dispute occur, the judges' decision will be final.

(2) All competitors must have attended at least eight lectures of this series.

(3) No competitor can take more than one prize. The judges are empowered to withhold any, or all, prizes at their discretion. Good design will receive more consideration than skill in draughtsmanship, i.e., design thoroughly appropriate for the material dealt with. Drawings may be either in pencil or in ink, and may be coloured. Preference will be given to good working drawings. No design to be framed or mounted. The greatest care will be taken of drawings, but the company will not hold themselves responsible for them.

(4) No names must appear on the drawings, but a distinguishing motto or number must be put on each single drawing of each set. The name and address of the competitor to be enclosed in a sealed envelope, bearing on the outside the motto or number which is used on the drawing or essay.

(5) All drawings for the above competitions to be delivered, carriage paid, at Carpenters' Hall, London Wall, London, E.C., before 12 noon, on May 14th, 1910.

SUBJECTS OF COMPETITION.

1. Design for a small detached cottage to cost about £150 or £200. Plans, section two elevations, scale ⅛in. to a foot. The objects to be aimed at are simplicity and straightforward use of materials without decorative features. First prize, £5 5s.; second prize, £2 2s.; third prize, £1 1s.

2. (1) Design for a simple cottage table, (2) design for a simple arm-chair, (3) design for any decorative work, such as frieze for a room, colour scheme, or any other mode of ornament. (Only two of this section to be attempted.) First prize, £3 3s.; second prize, £2 2s.

3. Design for interior of a living room. Plan and elevations of two or more sides, showing fireplace and window. Any scale. First prize, £4 4s.; second prize, £2 2s.

4. Design for a piece of work which must be in the material of the competitor's trade. First prize, £3 3s.; second prize, £2 2s.

Mr. W. Noble Twelvetrees, M.I.Mech.E., A.M.I.E.E., M.R.San.I., has removed to 193, Bedford Hill, S.W. The telephone number, 1221 Battersea, remains unaltered.

* * *

At the meeting of the R.I.B.A., on Monday, 13th inst., the decease of the following gentlemen was announced:—Henry Bayly Garling, Associate, 1843, Fellow 1857; Thomas W. Cutter, Associate, 1873, Fellow, 1879; George Campbell Sherrin, Associate 1882, Fellow 1898.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Dec. 31.	SOUTHEND-ON-SEA. NEW COUNCIL SCHOOL. Limited to Architects practising in the Borough. Conditions of competition and plan of site on application to J. W. Barrow, Clerk to the Education Committee, Education Offices, Municipal Buildings, Southend-on-Sea.
1910. Jan 1.	LARNE. TECHNICAL SCHOOL IN VICTORIA STREET. For the Larne Technical Instruction Committee. Total cost, including fixtures and enclosing of ground, not to exceed £3 600. Premium, £21, merged. Successful competitor will receive commission of 5 per cent. for supervision, including plans, specifications, estimates, and *Bills of Quantities*. Particulars of Thomas Clearkkin, Secretary, Technical Instruction Committee, Larne.
Jan. 1— Mar. 1.	NEW BUSINESS PREMISES, LEEDS.—The Directors of the Leeds Industrial Co-operative Society (Ltd.) invite competitive drawings and estimates for new Business Premises and Offices, to be erected on the site of the old "Mercury" Office, Albion Street, Leeds. Premiums of £100, £50, and £25, respectively are offered, and will be awarded to the authors of the designs and plans placed first, second, and third by the Assessor. Conditions of competition, and lithographed plans and other particulars, will be forwarded on application to the Secretary, on or before Jan. 1, 1910, on receipt of stamped addressed foolscap envelope, accompanied with a deposit of £2 2s. Competitive designs and plans to be sent in to the Secretary, John W. Fawcett, Leeds Industrial Co-operative Society (Ltd.), 10, Albion Street, Leeds; not later than March 1, 1910. To the architect deciding not to compete, and returning all documents within seven days, the deposit will be returned.
Jan. 15.	ELEMENTARY SCHOOL, KEIGHLEY.—The Education Committee invite competitive designs and estimates for a new Public Elementary School for older children to be erected at Highfield, Keighley. Printed instructions and conditions, with a lithographed plan of the site, may be obtained on application at the Education Offices. Designs and estimates to be sent by Jan. 15 to H. Midgley, Secretary, Education Offices, Keighley. Only architects residing or carrying on business within the Borough are invited to compete.
Jan. 31.	NATIONAL MUSEUM OF WALES. The Council desires to receive competitive designs for the erection of a new National Museum at Cardiff, Three premiums are offered of £200, £150, and £100, for second, third, and fourth. The Council have appointed Sir Aston Webb, R.A., Mr. John J. Burnet A.R.S.A., and Mr. Edwin T. Hall, F.R.I.B.A., as Assessors. Particulars and plans of the site will be supplied to competitors on payment of a fee of £2 2s., returnable if all papers are returned within 14 days. Inquiries to be addressed to Dr. Wm. Evans, Hoyle, Director of the Museums, City Hall, Cardiff.
Feb. 1.	OLDHAM, EXTENSION OF THE TOWN HALL. Restricted to Architects practising or residing in the Borough. Premiums of £50, £30 and £20, for the three designs placed 1st, 2nd and 3rd, and a sum of £5 will be paid to all unsuccessful competitors who send in a complete set of plans in accordance with the instructions. Plan of site, with instructions and suggestions for architects obtainable from E. C. Foote, Borough Surveyor, Town Hall, Oldham. Deposit: 21s.
Mar. 1.	GLAZED BRICKWORK DESIGNS AND ESSAYS. A committee of glazed brick manufacturers invite designs for works to be executed in glazed brickwork, also essays as to the advantages to be derived from the use of this material in accordance with conditions to be obtained from J. Johnston Green, 142, Liverpool Road South, Southport. Premiums of 100 guineas, 50 guineas and 25 guineas awarded to designs and essays jointly. Assessor Mr. Max Clarke, F.R.I.B.A., appointed by the President, R.I.B.A.
May 31.	MUNICIPAL OFFICES, KARACHI. The Municipality offer a premium of 7,500 rupees (£500) for the best design, detailed plans and estimates for new Municipal Offices. Cost not to exceed 500,000 rupees, and the style of architecture is left open to the designers. Ferrotype plans of the site and a general arrangement of the floors of the building showing the accommodation to be provided together with a copy of instructions to architects, will be supplied to intending competitors on application to the Chief Officer and Chief Engineer, Karachi Municipality. A charge of Rs. 5 will be made therefor, which will not be refunded. Each set of drawings must be sent in anonymously, but accompanied by a sealed envelope containing the author's name and address. Each set of drawings and all the documents required, including the sealed envelope, must be securely packed in a wooden box addressed as follows:—The Chief Officer and Chief Engineer, Karachi Municipality, Karachi, India, and forwarded, at the competitor's own risk and charges, in time to reach the Chief Officer on or before the 31st day of May, 1910. It is proposed to apply to Government for permission for one of the chief architects to act as assessor to decide on the design to which the prize shall be awarded. The decision of the assessor will be final and not be open to dispute. The decision of the Municipality will be made within three months of the latest date for submission of designs, and payment of one-half of the premium will be made thereafter to the author of the selected design, the balance to be paid when the further details specified in the instructions to architects have been supplied. On payment of the premium the Municipality will have all rights in the design, with power to erect the building under its own agency, either according to the design selected or with such additions or alterations as it may deem necessary.

Works in Progress and Completed.

ACTON.—The Acton Wells new schools, which have been built off the Victoria Road, North Acton, at a cost of £17,345, were recently opened. The schools comprise three departments on three floors, and give accommodation for 1,124, while the area of the site covered by the school and playgrounds is just over four and a half acres. The architects were Messrs. E. C. P. and H. Monson, of Acton.

BIRTLEY.—The new aisle and organ chamber which have just been added to the Roman Catholic Church of St. Joseph were recently opened. The contractors for the extensions were Messrs. Burnett and Sons, Birtley, and the architects, Messrs. Boyd and Groves, Newcastle.

GLASGOW.—The new buildings erected in connection with St. Andrew's Episcopal Church in Low Green Street are now approaching completion. The architect is Mr. H. D. Walton, and the contractors for the new work are:—Mason work, Messrs. M'Leod and Campbell; wright work, James Wilson; slater work, M. Bertram; plumber work, Hugh Twaddle and Sons; plaster work, Arch. M'Kellar; measurer, Mr. A. B. Watson.

JESMOND.—The foundation-stone of a new parish hall for St. Barnabas' Church, Jesmond, has just been laid. The buildings, which are planned so as to leave enough ground for an official vicarage adjoining, are estimated to cost £1,950. Mr. A. B. Plummer is the architect.

LEEDS.—The foundation-stone of the St. Chad's Church extension at Far Headingley, Leeds, has just been laid. For the purposes of the extension the present chancel and apse have been taken down, and a new and larger chancel, 40ft. long by 24ft. wide, has been erected. A new choir and new clergy vestries are also comprised in the scheme, and it is proposed to erect a new side chapel, measuring 50ft. by 18ft. A new organ chamber is to be built, and an organ has already been promised. It is estimated that the cost of the extension will amount to about £4,800. Another £1,000, it is estimated, will be required for the proposed additional side chapel. Messrs. Wilson and Son, Headingley, are the contractors for the extension work, and Messrs. J. Gibbons and Son are the architects.

LONDON.—The new premises of St. Patrick's Benevolent Society, in Stamford Street, have just been opened. Three years ago the London County Council compelled the Society to rebuild and modernise its premises, and this work has just been completed at a cost of £10,000. The front part of the old building still stands, but is devoted entirely to administrative purposes; the old class-rooms at the back have been pulled down and rebuilt, and the playground space between the two wings is now occupied by a large assembly hall for the boys and girls.

Messrs. E. A. Roome and Co., builders, of 36, Basinghall Street, E.C., and Urswick Road, Homerton, N.E., have secured the contract for the completion of St. John the Baptist Church, Holland Road, Kensington, under the supervision of Messrs. James Brooks, Son and Adkins.

NEWCASTLE.—The new technical wing, which forms an extension to Rutherford College, Newcastle, is now being erected. The materials employed are red brick, with diaper of darker coloured bricks, and terra-cotta dressings. The roof is a concrete flat, covered with asphalte. Messrs. Middlemass Bros. are the contractors, and Messrs. Oliver, Leeson, and Wood, the architects, of Newcastle.

RADLEY.—The Council of Radley College have decided to proceed with the design for a new hall, prepared by Mr. T. G. Jackson, R.A., to correspond with the chapel built by him fifteen years ago. The new hall is estimated to cost £8,000. Messrs. Parnell, of Rugby, are the contractors.

SOUTHEND.—The new Hippodrome, which has been erected from the designs of Mr. Bertie Crewe, is English Renaissance in style, and is constructed in buff terra-cotta with dark red bricks and glazed brick dressings.

WALSALL.—The new drill hall, which it is proposed shortly to erect at a cost of £3,000, including the necessary fittings, will comprise a drill shed 100ft. long by 50ft. wide, quarter-master's store, office, armoury, etc. The architects are Messrs. Hickman and Farmer, Fellows of the R.I.B.A., and Mr. W. Wistance is the builder.

WAVERTREE, LIVERPOOL.—The new church of St. Thomas, which has just been consecrated, has been completed in every detail at a total cost of £6,845 10s. The exterior of the building is of brick, while the nave columns, the pulpit, and all the internal stone dressings are of white Bath stone. Seating accommodation for 703 persons is provided. The building contractors for the work are Messrs. Morrison and Sons, of Wavertree, Mr. R. Wynn Owen, A.R.I.B.A., of 60, Castle Street, Liverpool, being the architect.

WESTMINSTER.—The new Government office, which is to be erected in George Street, Delahay Street, and part of Charles Street, Westminster, will cost £1,000,000. The late Mr. J. M. Brydon was the architect.

The City of Paris has just been asked for a concession for a system of underground electric railways to unite the different stations of the Ouest-Etat, Nord, Est, Bastille, Paris-Lyons-Mediterranean, Orleans, with one another, and also with a station which is to be constructed near the Halles Centrales. The system, which is entirely independent of the existing Metropolitain, is intended for the rapid transport of merchandise. Its object is to relieve the congestion in the centre of Paris, which is encumbered all day by waggons of every kind. The plans contemplate a construction similar to that adopted for the system of 70km., which is to be established in Vienna for the carriage of mails, parcels, etc.

EFFECTS OF FIRE ON FIRE-RESISTING CONSTRUCTION.[*]

By A. Pordage. Firemaster of Edinburgh.

My experience has led me to the conclusion that it is not so much the matter of material as of internal arrangement of areas, floor spaces, partitions, and divisions, that is all-important in determining how far a building with its contents will resist effects of fire within its walls. The non-inflammability or otherwise of constructive material can have no retarding effect, for instance, in a light goods warehouse, where the floors are arranged in a series of galleries round a well through the centre of the building. And yet the materials in such buildings are carefully selected on the most scientific principles.

The disposition of spaces and partitions, and above all the particular uses to which the building is intended to be applied, are the governing factors in fire-resisting construction. It is erroneous to apply the term to the structure alone.

I am inclined to the belief that no building of whatever nature, stocked with highly inflammable goods, when once the stock has got well alight, will withstand the effects of the fire without sustaining serious damage to its stability.

I propose to show you the effects of fire on various building materials, by which you will see that, whilst under certain inexplicable conditions, a particular stone or manufactured material will come well out of the ordeal in one instance, it disastrously fails in another.

A most essential and deciding factor in a building during a fire, and one that has an important bearing upon the stability of stone and other material, is that of the air currents. Most materials, subjected to excessive heat in a still atmosphere, with a gradual rise and fall of temperature, will not be seriously affected; but if the same materials are subjected to sudden alternating currents of hot and cold air, the effects of expansion and contraction play havoc with walls and supports.

I will first take as an illustration the effect of fire upon what is commonly supposed to be an exceedingly reliable and "fireproof" requisite to most buildings, especially in Scotland, viz., a stone stair. As a stone stair has its slabs embedded in the wall, the effects of a sudden application of heat to the projecting portion of the slab causes it to expand. That portion of the slab which is embedded in the wall is not so suddenly affected, and if it were, it could not expand in the same ratio as the projecting portion. As a consequence, the expansion causes a fracture at the edge of the wall, and the projecting portion falls to the ground.

What makes the stone stair unreliable under these conditions is that it is not essential that the stone should come into actual contact with flame; the heat set up by fire in another portion of the building is sufficient to cause the stonework to collapse.

I have repeatedly seen, at fires in large houses where the stone stair has been taken up to the second or third floor and continued thence to the top floor by a light wooden stair, that the stonework has collapsed into fragments, and the wood stair at the top, where the greatest heat has been generated, has been almost wholly unaffected.

On the other hand, a common white wood stair often remains in position, and what is left of the unconsumed timber is sufficient to admit of firemen passing over it with safety.

A hard-wood stair, say, of 1in. treads, filled in with pugging or deafening, and a soffit of good plaster on the underside, will withstand the effects of actual contact with flame for the whole period of a fire; and, unlike stone, it is not affected by cold air or water. It is the sudden alternation of heat and cold which causes stone to collapse.

Of all material used in building construction, and particularly for stairs and unprotected landings, stone is the most dangerous when subjected to the effects of fire.

The position as well as the composition of stairs is an important matter to consider in designing buildings, particularly those of a public character, where large numbers of the public are to assemble. The stair well should not be within the main building, but should be attached. It is also a mistake to enclose these stair wells within four walls. The top outer half of each landing should be open to let off smoke or vitiated air. The size and number of stair wells should be determined by the number of people likely to require to use them.

The common stair in an ordinary tenement in Scotland does not add to the comfort or safety of the residents; a fire occurring on the lower floors causes the upper floors to be filled with smoke. Most common stairs are not ventilated at the top; consequently all the smoke escaping into the stairs from the house in which the fire has occurred has to be cleared off through the houses on the top floors.

It has often occurred to me that, instead of running the front wall of tenements up to the top in an unbroken line, balconies should be formed on each landing, the top half of which would be open to the air. The stairs would always be ventilated, no draughts flowing up under the doors, and no accummulation of vitiated air on the top floors. Such an arrangement would be an immense advantage in case of fire, because only the particular house on fire would be affected by the smoke, whereas with an enclosed stair as at present existing, a fire on the lower flats means that the whole of the residents above have to turn out, with the probable necessity of rescue from suffocation from the windows. I might also suggest that ornamental balconies would be a break in the monotony of our long rows of flat-walled tenement streets.

It should be borne in mind that stone stairs will not prevent smoke and heat rising up the stair well, and that, no matter what may be the construction of the stair, no human being can face the heat that would cause a wooden stair to burst into actual flame. Consequently, a wooden stair that will remain intact under all conditions is safer than any material that is affected by heat or cold.

The results of fires in different parts of the world have demonstrated most clearly that there has not yet been built any special class of structure that has withstood the ravages of a conflagration. It is difficult to say what constitutes a really fireproof structure. I think it may be safely concluded that, given a building of any material, and fill it with combustible stock, if that stock becomes thoroughly well alight and inaccessible to modern fire fighting appliances, the building will be destroyed. Metal construction has failed. Almost every variety of stone has proved to behave disastrously when exposed to a fierce fire; and of all building material, good, sound, and solid timber, though doomed in the end, has been found to withstand the effects of fire longer than iron or steel. One trait in its favour is that it is neither distorted nor deflected by the heat. A wooden beam must be consumed to the breaking point before it gives way. Sound and seasoned timber gives far greater security and stability to a building on fire, and permits of the fire being attacked from within.

As an illustration of this contention, I take the case of an ordinary tenement in Scotland. It is very rarely that a fire spreads from one floor to the next above, although the very commonest of building material is employed.

The exposed surface above the fire in the first place is common, and often inferior, plaster ceiling on wooden lathing nailed to the underside of the joisting. The joisting is rough, of the 9 by 3 standard. Then you get the deafening, a luxury rarely met with in English houses. The deafening is often non-inflammable, or of very slow combustion, but it serves the dual purpose of not only checking the fire but also blocking up the air spaces, and preventing the flow of air and flame between the joisting, and protecting the underside of the flooring of the flat above.

---

[*] Abstract of a paper read by Mr. A. Pordage, Firemaster of Edinburgh, at a meeting of the Edinburgh Architectural Association.

This class of construction is, of course, of a very common order, in point both of quality of material and of workmanship. Tenements which are run up at the cheapest possible price do not admit of very much in the way of specially selected and seasoned material. The internal divisions and the method, rather than the material, are responsible for the rarity of large fires in tenement buildings.

For large external walls, stone has proved to be absolutely unreliable. In the early days of my career in the fire service in London, fires in the older warehouses of brick and timber construction were always followed up from floor to floor without consideration for falling floors and bulging walls; but the introduction of unprotected iron for supports and joisting alters the complexion of fires entirely. The deflection and buckling of the girders bulge and bring down the walls, and concrete slabs used as flooring frequently do more damage by wrecking than the actual fire.

Properly bonded brick, with good mortar, will withstand the fiercest fire; and, what is more noteworthy with regard to a brick wall, is that, after all the supports have either been burned or fallen away, the wall will remain in position for days after a fire. In one striking instance, a brick wall, 45ft. high, 40ft. wide, and 18ins. thick, was the only one of the many party walls which withstood the effects of the fire.

Brick is least affected of all material, and will withstand the exposure to a fierce fire and application of water many times without detriment to its stability. I have not found in my experience any other form of construction of which the same may be said.

Steel and wrought-iron columns, inadequately protected, have in many instances failed most disastrously, and in others they have succeeded in keeping other ironwork intact. A mere coating of concrete is not sufficient; there should be 2ins. or 3ins. securely anchored to the column and girder, as in all cases air spaces, pipes, and tubing should be excluded from the coating round ironwork. In fact, the coating should be solid. The expansion of piping and tubing bursts the coating and exposes the iron.

If concrete is of a satisfactory aggregate, and is thickly coated and anchored on to steel and ironwork, it is contended that unequal expansion of either material is almost impossible. I am of opinion that reinforced concrete of brick, slag, or cinder aggregate, is satisfactory for floor construction, and will withstand fire better than any other form of metal construction yet introduced.

We have not had very much experience yet with reinforced concrete, as it is practically a recent introduction; but in the great American fires of the last few years this particular construction has stood the test better than anything else.

In dealing with the fire-resisting properties of buildings, it is, of course, important that the construction should be such as will retard the spread of a fire from one section to another; and a word in the direction of the growing tendency towards extraordinarily high steel frame buildings may not be out of place. Our building regulations have so far kept the dimensions of these buildings within reasonable limits; but, owing to their apparent fire-resisting properties, there is an inclination to follow the American methods. Already in London there are several such buildings of ten and twelve floors. Buildings beyond 80ft. may be considered to be beyond the immediate resources of modern fire appliances. Consequently, when a fire occurs beyond that limit, it cannot be so readily attacked. It has longer time to get ahead before being reached, and the chances are that the fire will spread amongst the upper floors of adjacent buildings.

This class of building has a large surface of wall-opening enclosed by glass, which affords no protection from outside fires. It is due to this fact that great fires of Baltimore and San Francisco spread so rapidly. The fire, travelling with the direction of the wind, passed through the window openings, out of the top of one building into another, jumping over the spaces occupied by smaller buildings, which latter in many cases escaped entirely.

Taking the structures apart from the contents at the Baltimore fire in 1904, most of the frame buildings which were burned out in so far as the contents and fixtures were concerned, and whose skeleton frames remained, cannot be said to have behaved satisfactorily. The top floors which were inaccessible to the fire-fighting appliances, acted as fire conductors. Their stone and ornamental dressings were stripped by the effects of the heat, making the work of the firemen below extremely hazardous. An extract from the report of Chief of Engineers of the United States of America says: "The exterior walls of many of the so-called fireproof buildings ought to be taken down. All of them are more seriously damaged than appears."

We have to go to America for the best information on record about building material, and I propose to give a few extracts from the excellent report presented to the United States Government by a special committee appointed to report on the great fire of Baltimore in 1904.

The report says: "For exterior walls, both stone and terra-cotta suffered severely. The effect of fire on terra-cotta was a surprise. It was thought that architectural terra-cotta for external walls was reasonably fireproof, but it failed completely at this conflagration. It cracked and fell to pieces, and the heat seemed to destroy its texture. In some cases it became soft and pliable. More particularly was this the case with projecting and highly ornamental work."

With regard to internal fireproofing, the report says: "The only successful partitions were of brick, these lost their plaster but were otherwise undamaged. Coke-breeze or cinder concrete behaved admirably. In many instances where the flooring had not been subjected to damage by wreckage, the cinder concrete floor remained solid and intact." It is important, however, with regard to coke and cinder aggregates for concrete, that all combustible and partly consumed coal be rigidly excluded. I have experienced several instances where coke-breeze concrete has become incandescent.

In addition to its fire-resisting qualities, it has the advantage of being superior in lightness to all other forms of concrete.

Stone of every description suffered severely, particularly projecting parts. Terra-cotta facings and ornamental work failed completely. Granite spalled badly, worse than any other stone under moderate heat. Marble spalled badly, but not so much as the granite.

Of materials used in exterior walls properly bonded brickwork was the only thing that was really successful.

Nothing can convey more clearly the value of the fireproof construction in a fire than one of the quotations contained in the conclusions of the Special Committee of the National Fire Protection Associations of the U.S.A., which says: "It may be expected that in fires of great severity the steel frame, its protective covering, the walls and floor arches alone will remain, and even these will be more or less damaged according to the character of the construction and materials used."

"The contents of a fire-resisting building, without proper subdivision and with no adequate protection against exposing fires, are scarcely any safer as regards destruction by fire than if contained in a building of ordinary construction."

These conclusions, arrived at after careful and exhaustive enquiry in the results of the various building constructions, prove conclusively that the tall steel frame-built fireproof building acts as a fire conductor when the contents of the building are alight and get beyond control of the fire equipment.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies, or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s. made payable to Technical Journals, Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable and it must be understood that both question and reply will, as a rule, be published in these columns

Cost of Office Buildings.

Glasgow.—"Investment" writes: "What would you suggest as a fair rate per cubic foot to approximate the cost of a large office block? The building would be of eight storeys and basement, built fireproof, and finished in a modern but simple manner. The offices would be in groups of two to five rooms."

—Such a block would most probably cost from eightpence to tenpence per cubic foot, varying with the degree to which equipment and finish is carried. F.S.I.

Illustrations of Lion Base.

Birmingham.—Lion writes: "I am anxious to obtain a small photograph or print of an Italian or Lombardic example of the lion base; also information as to where there are any mediæval examples in England."

—An illustration of the well-known 13th century pulpit of Siena Cathedral, which appears in Anderson's "Architecture of the Renaissance in Italy," shows several examples of the Lombardic Lion base. Good and cheap photographs of almost any detail of Italian architecture can be obtained from Alinari Bros., of Florence, to whom applicant is advised to state his wants. There are no mediæval examples in England. G.

Plaster Peeling Off.

Ireland.—C. K. writes: "A customer of ours is greatly troubled through several houses which he plastered with cement, throwing off the cement after a number of months. The bricks of which these houses are built are common red solid brick, made locally, and our customer tells us that they were thoroughly wet before the cement was put on. The cement is put on in two coats mixed with clean sand, in a proportion of two to one. It seems to us, and our customer has the same opinion, that this is due to a white fluffy substance which seems to come out of the brick and separate the cement from the wall, at the same time causing the surface of the cement next to it to become rotten. One gentleman whom we spoke to on the matter said he thought it was gypsum, which was in the clay the bricks were made of; another said it was magnesia. Have you ever heard of similar cases, and do you know of any remedy which would prevent the cement coming off, as in some cases it has come off three times on the same wall? The cement is of standard quality."

—Some bricks which are increasingly used in Ireland are of so dense a nature that it is almost impossible for cement to adhere to them, as there is nothing in the surface of the bricks which can act as a "grip" or "key." The cement is not thrown off because of the "white fluffy substance," nor by the presence of gypsum or magnesia in the brick. Similar bricks are well known in England. All that can be done when they are required to be faced with cement or

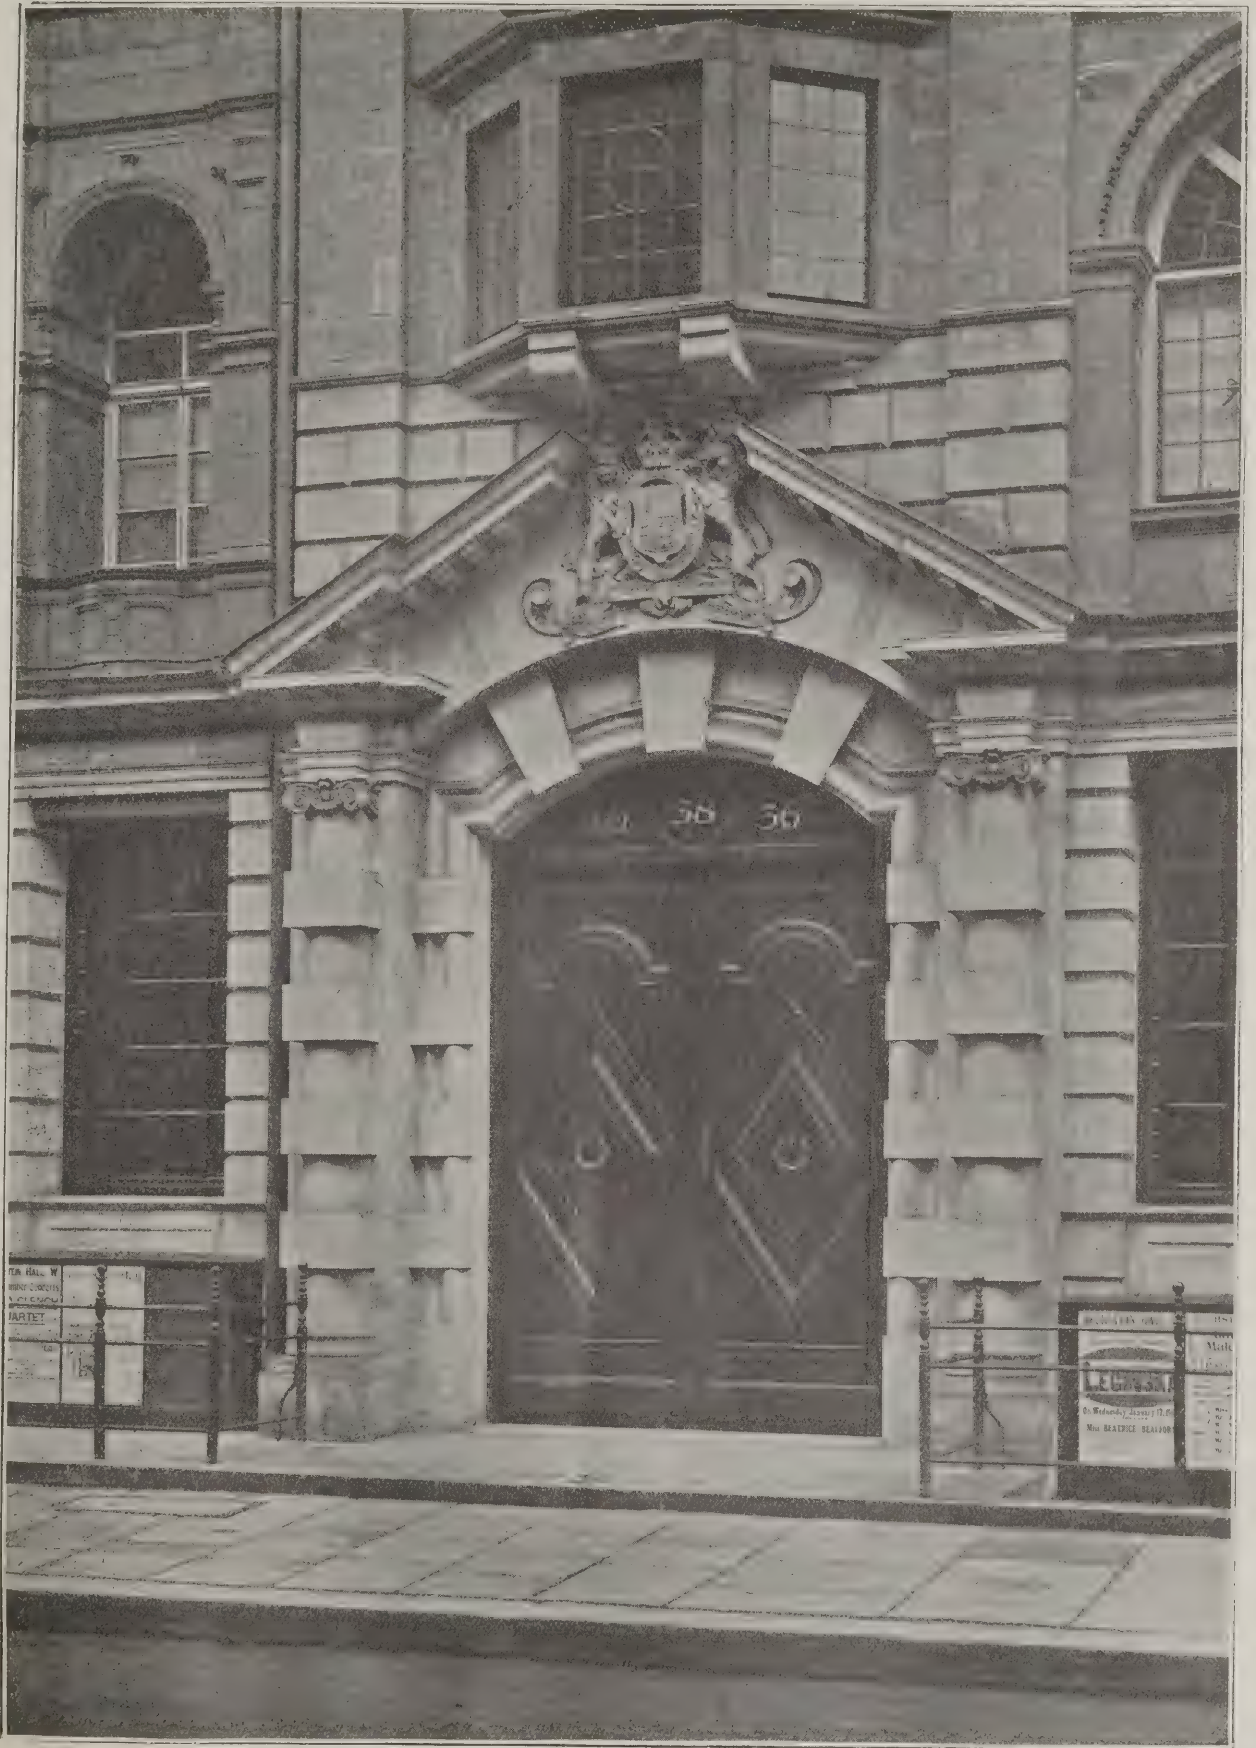


Photo: S. B. Bolas and Co.

ENTRANCE DOORWAY, PREMISES IN WIGMORE STREET, LONDON, W. WALTER CAVE, ARCHITECT plaster is to make them with grooves or keys in the face, so that the plaster or cement may adhere. This defect is so troublesome in some bricks made in the East of England, that many architects refuse to use them when plaster is required. The cause of the defect is that the particles of which the bricks are made are so close to each other—often cemented with a kind of glassy material formed in the burning—no pores are left into which the cement can run and easily adhere. Sometimes this density of texture is only on the surfaces of the brick, and the cement can then be made to adhere if grooves are chipped in the brickwork of a depth sufficient to reach the more porous material beneath the face of the brick. This process of chipping is, however, a costly one. There are several other causes which might result in the cement being thrown off such as the bricks being frozen when the cement is applied, or the cement and sand being improperly mixed; but the explanation of the trouble is most frequently to be found in the surface of the brickwork itself. Bricks of this character are usually so resistant to weather, that there is no advantage whatever in facing them with cement, and for stucco work, more porous bricks should be used.

Books on Church Design.

BURNLEY.—J. V. K. writes: "Could you recommend a good book or books on details suitable for a small country church?"

—Two papers on "Modern Church Building," read before the R.I.B.A., by Sir Charles Nicholson and Mr. Hubert C. Corlette, and reprinted from the Institute Journal, may be obtained at the offices of the Institute, 9, Conduit Street, W., price 3s. 6d. They are full of useful information and suggestions on practical points of detail in church planning and equipment. An interesting address on the æsthetics of the subject, delivered by Mr. E. P. Warren, F.S.A., at the annual Court of the Incorporated Church Building Society, was summarised in the "Builders' Journal" of May 26th, 1909. The requirements and suggestions of the society appear in the current issue of the "Architect's Compendium." A perusal of the foregoing should give sufficient information for the purpose, if practical points of detail (which alone can be effectively gleaned from books), are referred to by querist; if details of "Gothic architecture" are sought, J. K. Collings' books contain a wide selection of measured examples, and the late Edmund Sharpe's "Mouldings of the Six Periods of Gothic Architecture" is invaluable. The latter also published, in "Churches of the Nene Valley," numerous illustrations of details from the fine churches of that district; but the practice of transplanting detail designed for the local material of one district to another having quite different characteristics, is one to be deplored. Cannot querist obtain local inspiration?

Fireproof Floor.

A. H. (LONDON, N.W.) writes:—I have to convert the lower part of a two-storey building into a store house for somewhat inflammable materials (i.e., packing cases, etc.). There is no access from the upper floor to the lower part, but the floor of the upper story is an ordinary wood joist and boarded floor, ceiled on the underside in the ordinary way. The upper storey of the premises being in separate occupation prevents my getting on the top of the floor to pug it, and any material used must be applied from the underside and be in the nature of a fireproof ceiling. What do you advise?"

—As the upper part of the floor cannot be touched, the best method of making the floor fire-resisting without reducing the headroom is to remove the laths and plaster and replace it with expanded lathing, covered with Robinson's Adamant fireproof plaster. This will only retard the progress of a fire and cannot be considered as giving reliable protection to the upper part of the building; the most satisfactory method would be to put in a new floor entirely.

HENRY ADAMS.

Urban Council's Powers.

BARNSLEY.—A. M. writes:—"(1) Can an Urban District Council make by-laws to enforce the building of water closets to all new buildings (instead of privies and ashpits) and whether certain powers would have to be obtained from the L.G.Board. (2) Can an Urban Council enforce me to build new privies and ashpits in place of old ones now at front of houses—the above has been cited as a nuisance, also what Health Act would be used to make me do this."

—An Urban District Council acts under the usual by-laws approved by the L.G.B., and must accept those by-laws and no others. They cannot themselves make any new by-law without the approval of the L.G.Board. The answer to each of your questions is in the negative, provided of course that no nuisance exists. Everything turns upon this point, and if it can be proved that a nuisance does so exist, the owner can be called upon to remedy it (Public Health Act, 1875, section 91, etc.).

F. S. I.

Bending Joists.

BRENTWOOD, GALWAY.—A. C. writes:—"Will you give me your opinion upon the following? A 15in.×6in.×59lbs. steel joist 29ft. long, 26ft. span (Glengarnock steel) got bent laterally during transit (presumably) to the extent shown on sketch (not reproduced) and has been bent back cold, to almost straight. This joist is to carry a concrete floor 6in. thick, in which it is embedded thus. Do you consider that the joist has been weakened to any appreciable extent? The concrete is coke breeze 5 to 1 of P. cement. The expanded metal before use has rusted to some extent by being stored in a shed having open sides. Would it be advisable to brush it with a steel brush and oil it?"

—We do not think the joist would be much improved by such a small amount of bending cold, as it is made of mild steel and should be able to withstand much greater deformation. Of course it is somewhat different with large sections, especially a joist bent in the way this was, but it is usual nowadays to insist upon all small and large rods in reinforced concrete work to be bent cold. The only effect of the bending, with proper elastic material, is to increase the elastic limit and sometimes the ultimate strength, so that any reduction in sectional area is off-set.

Regarding the expanded metal, it would be advisable to remove as much of the loose rust as possible by means of a steel brush, but no oil or paint should be used; the concrete will completely protect the steel and even remove the rust by absorbing it into the surrounding concrete and painting or oiling is dangerous, as it prevents the concrete getting into close contact and thus protecting the steel. The coke breeze should not be used alone for the concrete, but should be washed first and a certain amount of sand mixed with it to render it more impervious by filling the voids. We advise the proportions to be 4 parts coke breeze, 2 sand, 1 Portland cement.

Books on Estate Work.

AMBLE.—"NORTH SEA" writes:—"Will you advise me as to the best books to study in connection with:— (1) The planning and laying out of small country estates for building purposes. (2) The drainage of, and the disposal of sewage from these estates. (3) Book-keeping: I should prefer such a treatise on elementary book-keeping as would best teach the principles of book-keeping to form a ground for builders' and contractors' work."

—(1) "Building Estates," by J. Maitland, published by Crosby Lockwood and Co., at 1s. 6d. (2) Sanitary Work in the Smaller Towns and Villages, by C. Slagg, published by Crosby Lockwood and Co., 3s.; Sewerage and Sewage Disposal, by Robinson, published by Biggs and Son, at 7s. 6d.; House-drainage, by Spinks and Blake, published by Biggs and Son, at 7s. 6d. (3) Book-keeping, by W. Snailum, published by C. J. Clay and Son, Ave Maria Lane.

F. S. I.

Roller Rink Floor.

LITTLEHAMPTON.—R. E. B. writes:—"I want to know how to lay a wood floor for roller skating; also the best wood suitable for the purpose."

—The usual method is to lay a concrete bottom, say, 4in. thick, composed of 1 part of cement, 2 of sand and 5 of broken brick, stone, etc., the top being brought to a true level. On top of this should be laid Anderson's impregnated felt about ¼in. thick, and then narrow battens of maple, laid in the direction of the traffic, that is, straight down the sides, diagonally at the corners and across at the ends. Or a hardwood dowelled block floor may be laid over the felt; say, maple, jarrah, karri, oak or pitchpine, may be used with a wrought face and then no polishing is necessary. HENRY ADAMS.

Liability for Fire Premium.

CARDIFF.—"K" writes:—"We are executing a contract for the erection of a public building for a public body, which we tendered for from their bill of quantities. The building recently needed insuring, and not having made any provision for same in their quantities as on their previous contracts, we took the matter up with the Council and received the following reply from them: "The Council does not undertake to insure buildings in course of erection, as contractors are liable to complete the work whether fire should take place or not.' The Council does not insist on us insuring as you observe, but as the premium was not a heavy one, we covered ourselves rather than take any risks. Had there not been quantities we should have had no cause for complaint, but under the circumstances we do not consider the stand taken by the Council a just one, as it practically puts us to the cost of insuring without being paid for it. We shall be glad of your opinion on the point, both as to the legal aspect of it and otherwise."

—I should say that the position taken up by the Corporation is correct, and that a contractor is liable in every way for his contract, and for every accident, except those specially excepted in the conditions of contract, until he delivers it over as a completed work and until it has been accepted at least "de facto" by occupation, if not formally in writing.

If the quantities supplied by the Corporation were made part of the contract, the builder would be entitled (in my opinion) to the item for insurance on a final adjustment of accounts. If the quantities, however, are not part of the contract, he would not be entitled to the item for insurance except as an act of grace. A. G. W.

Practising in Prohibited Area.

(Reply to P., Northants.)

A was articled to B, and in the articles there is the following clause:—

"A covenants with B that he the said A shall not without consent in writing of the said B at any time hereafter open any office or hold out himself as practising the profession of an architect and surveyor on his own account or as clerk to or in partnership with any persons in the town of C—or within a radius of six miles of the Parish Church of C—and in case the said A shall commit any breach of this covenant the said A will pay to the said B the sum of £200 as liquidated damages for such breach thereof."

Now A has taken an office outside the radius of the town of C—and, should he do any work within that radius although his office is outside of it, would he commit a breach of his covenant and be liable to forfeit £200.

It is reasonably plain that, in the circumstances above mentioned, A would commit a breach of his covenant, which is perfectly reasonable and capable of being enforced. It can clearly be stated, upon the authority of numerous cases, that to solicit or execute

This is the original block built by Charles II. and stands on the west side of the great quadrangle. In the design Webb is supposed to have had the assistance of Inigo Jones.

orders in the prohibited area is to infringe a restriction covenant. In Turner v. Evans, 2 De G. M. and G., 740, the question was raised whether merely soliciting orders—e.g., sending travellers within the prescribed area—constituted carrying on a trade there, and it was held that it was. Again in Lake v. Harrison, 13 T. L. R., 568, it was held that a person who contracted not to carry on the business of a patent-agent within four miles of Chancery Lane, and who set up in business outside the radius could not conduct applications at the Patent Office. Upon these authorities, it is clear that A could not (*ergo*) superintend the building of a house inside the prohibited area.

B must wait, however, until he has evidence of an actual case of interference before he moves in the matter. He could then obtain an injunction in addition to payment of damages. B.

Testing Portland Cement.

LEWISHAM.—H. E. B. writes:—"With reference to testing the specific gravity of Portland cement by Messrs. Stanger and Blountflash, the displacement of oil is taken. I know oil is used to prevent the cement setting, but should not the sp. gr. of the oil be taken into account, as when one speaks of sp. gr. of a body it is compared with the weight of water of the same volume. Oil has not the same sp. gr. as water. I shall be obliged if you can enlighten me."

In determining specific gravity of Portland cement by the method referred to, account must be taken of the different specific gravity of oil as compared with water; of course, the specific gravity of the oil used must be known.

Bowling Green.

GREENOCK.—CONSTANT READER writes:—"A new bowling green was made seven years ago. The ground being on a slope was made up at one end and two sides with furnace ashes. The green has never been satisfactory, and the last time levels were taken it was found to be two inches higher in the centre than at the edges. The conclusion is that the banks of furnace ashes are consolidating and shrinking. How long should material of this description take to consolidate. Would a 6in. layer of stones, broken small, spread over the whole surface improve matters and keep an even surface, or would the weight of this material cause the ashes to sink more?"

—When a bowling green, or embankment of any sort, is made up to a level on sloping ground, there will always be a greater depth of unconsolidated material on the lower side of the hill and a tendency to greater shrinkage on that side. In this case the trouble appears more as if it were connected with the percolation of rainfall carrying away some of the salts and finer particles in the ashes towards the outside of the green. Another possibility is that the side slopes of the embankment were made too steep, and that they were now weathering down to their natural slope and lowering the surface. A layer of small stone spread over the surface does not recommend itself to the writer, but the middle might be rolled with a heavy roller and the slides made up an inch or so with fine vegetable mould and lawn sand. This would not involve a destruction of the present turfed surface.

HENRY ADAMS.

Rainfall at Manchester.

H. E. C. writes:—"What is the average annual rainfall in the Manchester district. What number of gallons of water is produced by one inch of rainfall per acre?"

—The average annual rainfall in Manchester is given as 35in. 1in. of rainfall gives 500 ton of water to the acre, there being 224 gallons to the ton. This would work out at 112,000 gallons to the acre.

Drainage By-laws.

LONG EATON.—A. B. C. writes: "A local authority refuses to pass plans showing a cesspool, the objection being that sewers are not laid. Are they justified?"

—The sanitary authority possess no statutory right to refuse to pass your plans merely because the waste waters from the proposed building do not pass into sewers, and I cannot imagine that they would attempt to do so If you consult that portion of the local by-laws which is headed "with respect to the drainage of new buildings," you will find full provision for such a case as this, and provided your drains comply with the requirements there laid down, the sanitary authorities have no option but to allow the building to proceed. F.S.I.

Laying Out Racing Tracks.

DUBLIN writes: "Can you recommend any book dealing with the laying out of cycling and running tracks?"

—I am not aware of any such text-book as you require, and should not advise anyone to lay out a cycle or running track without expert knowledge. The great secret of success, of course, lies in the thorough drainage of the subsoil, but there are many other details which make for success in such a matter. You may possibly obtain some information by addressing an enquiry to one of the journals devoting themselves specially to athletics. F.S.I.

Inspectorship and Other Posts.

SOMERSET.—S. H. writes: "(1) What are the qualifications for Inspector of Quarries? (2) Is it possible to obtain a post as building inspector, sanitary inspector, or inspector of nuisances, without special certificates? (3) Is there a periodical for clerks of works? (4) Where should one look for advertisements of vacancies for estate managers, etc?"

—(1) There is no such post as inspector of quarries. There are examinations held from time to time by the Civil Service Commissioners for posts as inspectors of mines and quarries, and a full prospectus can be obtained from them. Enquiries should be addressed His Majesty's Civil Service Commissioners, Burlington Gardens, London, W., and endorsed Inspector of Mines and Quarries. From the syllabus and papers the examination appears fairly elementary, but the oral is considered severe, and there are many applicants for few posts. Past examination papers are published by Messrs. Wyman and Sons, Ltd., Fetter Lane, E.C.

(2) It is impossible to obtain any remunerative post in the sphere our correspondent mentions, without obtaining the corresponding certificate. He should see the answer to a similar question by F. L., published in our issue No. 753, of July 14th last.

(3) The only periodical we know which is entirely published for the use of clerks of works is the Journal of the Clerks of Works Association of Great Britain, price threepence post free. The secretary of the association is Mr. J. Brady, 37, Sandyhill Road, Ilford, Essex.

(4) As to the best books in which posts as estate managers and overseers of works are advertised, we should certainly advise reference to the advertisement columns of the trade publications taken at the nearest public library. From time to time such advertisements occur in this journal, as well as in the daily papers, and occasionally in those periodicals devoted to country life and estate management. B. and B.

Appointments Abroad.

BERKSHIRE.—D. writes: "Please advise as to prospect of an architect's assistant obtaining employment in the British Colonies or Dependencies."

—There are a good many posts for architects' assistants in various parts of the Empire, but it is very unwise to go out until one has definitely obtained such a post, as the living abroad is expensive. The only way is to make enquiries of the Government Emigration Agents for the different Colonies and Dependencies, whose names and addresses can be found in the Post Office Directory, and to follow carefully the advertisement columns of this journal. The daily papers also occasionally contain such advertisements, but our correspondent should be careful to consider the cost of the passage to, and of the living at, and the healthiness of the particular place in question, in comparing the salary offered with that to which he would be entitled in England. He might also make enquiries of the secretary of the Architectural Association, 18, Tufton Street, Westminster. B. and B.

Thrusts in Masonry Dome.

LANCASHIRE.—RETLAW writes: "Please explain the stress diagram of the accompanying plan and section [not reproduced] of a masonry dome."

—Without some information as to the source of the diagrams submitted it is difficult to give any assistance, as they appear to be upon some special system. There is no accordance with usual practice. There is no satisfactory treatment of masonry domes in any book known to the writer.

HENRY ADAMS.

TOWN PLANNING CONFERENCE.

A two-days' conference on the practical administration of the town planning clauses of the Housing and Town Planning Act was opened at the Westminster Palace Hotel on December 14th, under the auspices of the National Housing and Town Planning Council. Alderman W. Thompson (Richmond, Surrey), the Chairman of the Council, presided at the morning session, and representatives of local authorities throughout the country attended, as well as of various societies and institutions, including the Royal Institute of British Architects, the Surveyors' Institution, the Incorporated Society of Municipal and County Engineers, the British Medical Association, and the Home Counties Association of Medical Officers of Health.

The Chairman said that the advocates of town planning now had a measure which lent itself to useful experiments that would show the precise nature of the amendments which would be needed before they obtained town planning in the fullest sense of the word. Running all through the town planning clauses was the question of how the various regulations, the general and special provisions of the Local Government Board, would be given effect to. Borough surveyors, architects, and engineers were already overburdened with work, and the new project was a vast one. In these circumstances they advised that the ratepayers should spend some money at the beginning in obtaining the very best skilled advice in the development of their towns. They also felt that the fullest possible encouragement should be given to that clause in the Act which provided for the co-operation of landowners.

The Council placed before the Conference as the basis for discussion a series of suggestions, on the preparation of which Professor Adshead (Liverpool), Professor Berlepsch-Valendas (Munich), Professor Eberstadt (Berlin), Professor Fuchs (Tubingen), Professor Patrick Geddes (Edinburgh), and numerous other gentlemen had given assistance. The suggestions of these gentlemen took the form of a skeleton plan setting forth the best course for a local authority to take in the administration of the new Act.

After a lengthy discussion a resolution was passed in favour of a Town Planning Committee being appointed by the local authority, and suggesting that "a limited number of persons specially qualified may be asked by the local authority to give advice on this point." The "clear statement of objects to be aimed at," it was agreed, should include the provision of parks and open spaces and the preservation of all places of beauty or of historic interest. It was agreed that it might be of value to call in the services of a skilled adviser to confer with the Committee to give technical advice, prepare statements, alternative suggestions, contour models of towns and surroundings, and to organise civic exhibitions.

Various other suggestions connected with the preparation of the town plan, the stage at which joint action between local authorities should be secured, and the special ob-

This view shows the river front in sharp perspective, with a piece of the return front to the great quadrangle. The block stands on the western side of the quadrangle and is one of Webb's finest works. The corresponding block on the eastern side was built at a later date.

jects of the town plan were agreed to at the afternoon session, when Councillor Shawcross presided.

At the second day's sitting, the discussion showed general agreement with the suggestion of British and foreign experts that persons interested in the land proposed to be included in a town planning scheme should be called into conference at a much earlier stage than is done in Germany. When the Town Planning Committee of the local Council had clearly defined the general objects of the plan, those interested should at once be called into conference. Before this step was taken it was regarded as of fundamental importance that the Committee should have decided upon the policy which was in the best interests of the community. In the final stage of promoting a town plan the meeting was unanimous that at the public inquiry by the Local Government Board the help of citizens and associations interested in public welfare should be again enlisted for the purpose of giving evidence as to the amenities proposed to be secured for the community by the scheme. At this stage, it was suggested, the Council should have the warm support of all who desired to secure the proper growth of the town. For the first years of the administration of the new Act, the tradition which would govern the practice for the next thirty years would be created, therefore there was need for the expression of the right civic spirit by leading citizens outside the Council.

Alderman Bennett (Warrington) said he believed that even members of the Councils at present had only the most shadowy idea of what town planning meant. They had to overcome a good deal of ignorance and reactionary feeling, and to pursue active educational propaganda. Mr. Aldridge (secretary of the Town Planning and Housing Council) said that this body had already secured the help of Messrs. Lever, Cadbury, and Rowntree in the appeal for a fund of £5,000 with which to educate the people of the country in the possibilities of the Act. It was proposed to send a well-qualified man to address citizens on the subject.

Alderman Thompson (Chairman of the Town Planning Council) urged that they should impress upon the Local Government Board the extreme importance of allowing every local authority, without prejudice to larger action afterwards, the power of controlling the small areas for the protection of the public, in order that people should not rush through building plans for developing areas in the old haphazard way. He suggested that the Act gave power to a Council without waiting to prepare the elaborate scheme for the whole town, to make a hundred applications in respect of small areas.

Mr. Raymond Unwin thought that such a protective plan would be a very simple affair, quickly prepared, and that it would not prevent the Council from reconsidering the planning of the area when they made the scheme for the whole district.

The Conference agreed, after further discussion, that the attention of the Local Government Board should be called to the urgent need for devising at once some simple and effective procedure for protecting the community against the passing of street and building plans for the immediate development of areas on unsatisfactory lines before the town plan is made.

The cost of the town planning scheme and the necessity of its early consideration by the local authorities was spoken of by the Town Clerk of Blackburn, who said that the whole movement would be discredited in a town if, after a scheme was launched, the Council found themselves unable to retreat from a quagmire of compensation which would make the cost excessive.

Mr. Aldridge said he did not think that compensation to persons under the Act would involve much expense to the local authority. In Germany compensation was only paid when existing buildings were interfered with.

The Town Clerk of Rochdale thought it would be similarly limited under Mr. Burns's Act. The Conference agreed that good deal depended on the regulations issued by the Local Government Board.

Subsequently the Advisory Committee met to consider the points upon which representation is to be made to the President of the Local Government Board. There will be a Conference of borough officials in February on the technical administration of the Act, and in July there will be a Conference at the Institute of British Architects. During the International Housing Congress in May next it is proposed to arrange a tour of some Continental cities to study town planning.

LONDON COUNTY COUNCIL (GENERAL POWERS) BILL, 1910

The General Powers Bill to be introduced into Parliament in the session of 1910, deals with the following subjects that are of interest to builders and contractors:—

Street Improvements.—Power is sought to enable the Council to widen Church Street, Kensington, and to divert and widen Belvedere Road fronting the proposed new county hall. Power is also sought to require the Kensington Royal Borough Council to contribute towards the former widening.

Purchase of Lands.—Provision is made for the compulsory purchase of lands in Brookgreen Road, Hammersmith, for fire brigade purposes, and for the revival of powers for the compulsory purchase of lands in Lincoln's-Inn-Fields under the London County Council (Improvements) Act, 1899.

Smoke Nuisance.—Under this heading an amendment of Section 24 (*b*) of the Public Health (London) Act, 1891, is sought. That section provides that "any chimney (not being the chimney of a private dwelling-house) sending forth black smoke in such quantities as to be a nuisance," shall be a nuisance liable to be dealt with summarily under the Act, and it is sought to amend the section by the deletion of the word "black" and by the extension of the meaning of the word "chimney" so as to include openings through which smoke is emitted, which would not otherwise come within the scope of the section, and the chimneys of any building or place in which operations or processes are carried on under statutory powers, and also the chimneys of any Government workshop or factory. Power is also sought to enable the Council in special cases of nuisance arising under sections 23 and 24 of the Public Health (London) Act, 1891, to take proceedings at the request of and by agreement with the sanitary authority, and to enable the Council to take proceedings in respect of smoke arising from some cause outside the county of London. Provision is included to enable the Council to take proceedings against sanitary authorities in respect of smoke nuisance from any building or premises belonging to or used by sanitary authorities, and power is sought to enable the Council to expend such money as it may think expedient, not exceeding £500 a year, for the advancement of measures for the abatement of smoke nuisance.

Employment Agencies.—Under this heading the Bill provides that after January 1st, 1911, no employment agency shall be carried on unless licensed. Following the precedent of Part XI. of the London County Council (General Powers) Act, 1905, which deals with the registration of employment agencies, it is provided in the Bill that the Council shall be the licensing authority, so far as concerns the county of London, and the City Corporation the authority for the City of London. The Council's resolutions of May 18th-19th, 1909, contained no direction on this point, but we have assumed that the intention of the Council was that the position of the City Corporation should not be disturbed. Power is sought to enable the licensing authority to charge fees for the grant or renewal of a licence, and to make by-laws prescribing the books to be kept by persons holding licences, and any other matter which may be deemed necessary for the prevention of fraud and immorality in the conduct of any agency and for regulating any premises used for the purpose. Labour bureaux and exchanges and employment agencies conducted by a trade union or by a religious, philanthropic, or industrial institution otherwise than for private gain may be declared by resolution of the Council to be exempt from the provisions of the Bill. Employment agencies carried on as theatrical or music-hall agencies are exempted from the provisions with respect to the books to be kept and the entries to be made therein, and the inspection of such books and entries except in so far as such agencies are carried on for any other purpose.

Extension of Time.—An extension is sought for the completion of the widenings of Southampton Row, authorised by the London County Council (Tramways and Improvements) Act, 1903.

Power for the Camberwell Metropolitan Borough Council.—Power is sought to enable the Borough Council to acquire lands (i.) in Crystal Palace Road for purposes in connection with the public baths in that road, (ii.) in Toulon Street, with power to convey any part thereof to the trustees of St. Joseph's Roman Catholic school.

Miscellaneous and Financial.—Under this heading the Council seeks to be empowered to stop up part of Laxon Street, Bermondsey, and to appropriate for education purposes the site of the portion stopped up.

Fire Prevention Notes.

L.C.C. Fire Committee Notes. The London County Council Fire Brigade Committee has recommended for acceptance the tender of Messrs. Kerridge and Shaw for the erection of the superstructure of the extension of the chief station of the Fire Brigade. The tender, which is the lowest of twelve, amounts to £16,861. The highest is £18,059, and the architect's revised estimate of the cost of the work is £17,550. The committee recommend that in order to facilitate the descent of firemen from the upper floors to the appliance rooms, second handrails should be provided on the staircases at a further six fire-stations, namely, those of Hampstead, Homerton, New Cross, East Greenwich, Lewisham, and Dulwich. The Council on 20th July, 1909 accepted a tender to supply and fix, from time to time as required, not less than 1,000 and not more than 8,000 hydrant indicator tablets, at the following prices, viz., square single tablets, 11d. each; oval single tablets, 1s. 1d. each; and double or corner tablets, 1s. 4d. each, the price in each case including wooden blocks, iron stays, etc. The company now ask that they may be paid an additional sum of 3d. for removing the old tablet in each case in which a new tablet is substituted for an existing one, and 6d. for the same work where no new tablet is substituted. No provision was made in the contract for this work, and the committee think that the firm's request should be acceded to. Between November 22nd and December 6th, inquests were held into five cases of death from fire in London. All the persons who lost their lives, died or were removed from the premises in which the fires occurred before the brigade was called.

A Survival of the Great Fire. An interesting reminiscence of the Great Fire of London arises in a report of the London County Council Local Government, Records, and Museums Committee, who state that there has been brought to their notice a proposal of the Metropolitan and District Railway Companies to rebuild Mark Lane Station. The proposal includes a scheme to erect over what is now practically a ventilating opening, buildings to a height of from 26 to 34ft. As buildings of this height would seriously interfere with the view from the north side, of All Hallows, Barking, which is an exceptionally fine specimen of fifteenth-century Gothic architecture, containing much fine wood carving and many ancient monumental brasses, and one of the few churches that escaped the Great Fire of London, endeavours have been made to secure a restriction in height of the proposed buildings. At the instance of the Council, certain modifications have been made in the plans which will lessen to some extent the obstruction to the view of the church, and the committee have caused a letter to be addressed to the Corporation of the City of London expressing the hope that it will take any action it can to secure an unrestricted view of the church.

Protection of Hampton Court Palace. The First Commissioner of H.M. Works, etc., has requested that in consequence of criticism of the arrangements in force for the protection of Hampton Court Palace in case of fire, the chief officer of the London fire brigade may be permitted to make an inspection of the palace at an early date with a view to his advising the First Commissioner in the matter. Although a large number of Government buildings are at present periodically inspected by the chief officer, it has not been the practice for buildings outside the county of London to be so inspected, but in view of the special character of Hampton Court Palace and its national importance, the L.C.C. Fire Brigade Committee are of the opinion that the request of the First Commissioner should, as a special case, be acceded to. This is a wise step; but we cannot help thinking that the inspection should be made with the assistance of an architect. Judging from the building knowledge displayed by Mr. Pordage, Firemaster of Edinburgh, in the excellent paper printed in the present issue, fire officers apparently make it their business to acquire more than a mere smattering of building construction. It could be wished that architects would take their revenge more amply by giving full heed to the kind of information that is imparted so authoritatively and so agreeably in Mr. Pordage's paper; and the fact that an architectural society—that of Edinburgh—invited him to read it, encourages the belief that the desirability of obtaining first-hand information on fire prevention is becoming more clearly recognised by architects. Further co-operation of the kind should ensue. In such matters as that of the inspection of Hampton Court Palace, the fire officer may be expected to know most about the ways, and the architect most about the means of fire-prevention, and each can help the other in the revision of ideas. "Combine your information" used to be an axiom of educationists; and here is an opportunity of giving it force and effect.

Federation News.

LONDON MASTER BUILDERS' ASSOCIATION.

The Council met on the 9th and 16th December, 1909, when the President (Mr. F. G. Rice) occupied the chair.

Matters of an important character were discussed, and instructions given concerning them. The firms recommended by the Organisation Committee for election were adopted, and the Council felt that something should be done in connection with sub-contractors who wished to join the association as associate members. With those who are purely builders' merchants, there is no difficulty, but it was felt necessary to do something to enlist the cohesion of the sub-contractors in case of labour troubles. A declaration to be given was adopted, and a motion to amend the rules will be accordingly made at the next annual general meeting to meet these cases.

The quarterly financial statement was submitted, and considered together with the investment account. Among other items, cheques were drawn for the association's subscription for 1909 to the National Federation, and contribution for the same period to the National Federation reserve fund.

It was decided to eliminate from the list of members those whose subscriptions were more than two years in arrear, and from whom no satisfactory reply had been received to a recent communication.

The firm of Messrs. Minton, Robertson and Co. (chartered accountants) were invited to audit the accounts for the current year.

The Council gave further consideration to the case of a builder who is contesting the decision of an arbitrator, and gave instructions accordingly.

The president (Mr. F. G. Rice) reported that he accepted an invitation to attend the conference on the apprenticeship question at the Mansion House on December 3rd, and reported the proceedings to the Council. It was regretted that no employer representing the building trade had an opportunity to speak at this meeting. A gentleman who, apparently, was not present, was announced to speak on behalf of the building trade, but he was in no way connected with the London Master Builders' Association nor with the National Federation of Building Trade Employers. It would certainly be most desirable to enlist the sympathies and co-operation of the employers of the building trade if the movement is to be successful in our trade.

As a result of the conference with the Quantity Surveyors' Association, the Council decided to send a copy of the following resolution, come to at the time, to every member of the association:—

"That this conference disapproves of the practice of asking for tenders in competition for works of a substantial value without quantities, prepared by a fully qualified surveyor, being supplied, and is of opinion that such quantities should be supplied in all cases when competitive estimates are invited for works expected to cost £500 and upwards."

A deputation, consisting of the president (Mr. F. G. Rice), Mr. W. Shepherd, Mr. J. Randall, and Mr. G. Bird Godson, together with representatives of the National Federation, were received by the president and officers of the Royal Institute of British Architects on Monday December 13th, and discussed the question of bills of quantities being supplied. After a very pleasant interview, the deputation left with the assurance that the matter would be laid before the R.I.B.A. Council.

Mr. F. G. Rice and Mr. Wm. Shepherd spoke for the L.M.B.A., and Mr. Ernest J. Brown for the National Federation.

A communication from the London Association of Master Decorators was received, and it was decided to appoint the president and officers of the association to meet the Master Decorators.

Several questions of interest regarding trade practice were considered, such as demarcation of work and the Leicester arbitrator's decision as to plumbers' work.

The arrangements for the annual dinner in February next were left to the president.

Mr. L. Horner and Mr. G. Bird Godson were deputed to act with Mr. J. Carmichael in matters relating to the ventilation, etc., of the new offices in Kingsway.

The following committee was elected to consider alterations necessary in the rules of the association: The president (Mr. F. G. Rice), Mr. L. Horner, Mr. G. Bird Godson, Mr. J. S. Holliday, Mr. W. Shepherd, Mr. Frank May, J.P., Mr. F. Higgs, and Mr. F. L. Dove, L.C.C.

The following members were elected to represent the L.M.B.A. on the National Federation Council and Administrative Committee:—Council, the President (Mr. F. G. Rice), Mr. J. Carmichael, J.P., Mr. S. B. Depree, Mr. F. L. Dove, L.C.C., Mr. G. Bird Godson, Mr. L. Horner, Mr. J. S. Holliday, Mr. J. F. Parker, Mr. F. M. May, and Mr. A. W. Turnbull. Administrative Committee, Mr. B. I. Greenwood and Mr. W. Shepherd.

It was decided to inform the members of the L.M.B.A. that the rules relating to measurement of slating and tiling issued recently by the Master Slaters' Association had not been considered or approved of by this Council.

The meeting terminated after lengthy duration.

BIRMINGHAM ASSOCIATION.

Secretary: G. Henry Wright, F.C.I.S.

The Council of the Birmingham Building Trades' Employers' Association, at a recent meeting considered the proposals of the Amalgamated Society of Carpenters and Joiners, and the Associated Carpenters and Joiners' Society, for alterations and additions to the rules of the National Board of Conciliation. The proposed amendment of Rule 19, which relates to alteration of rules, was objected to on the ground that it failed to provide for notice being given, but empowered any board or branch at any time to move for alterations. Whilst it was admitted that the principle of the proposed new rule to make a representative on one Board ineligible to sit on another, had something in its favour, it was regarded as being impracticable for employers' associations, especially those in the smaller centres. The proposal to amend Rule 3 by increasing the representation on the National Conciliation Board, was also objected to, as was the proposal to amend Rule 4 by providing that "It shall be the duty of the aggrieved party to draw up the notice to the Centre Conciliation Board." The proposal to amend Rule 16 by providing that the arbitrator to be appointed by the Board of Trade should be a "permanent paid official of the said Board," was objected to for obvious reasons—not the least of which is the very limited choice the Board would have in selecting an arbitrator.

The Handsworth Urban District Council having drafted new by-laws for streets and buildings, a committee has been appointed to examine them, with power to act.

Notices have been received and considered from carpenters and joiners, bricklayers, and labourers, for alteration of the working rules, and counter-notices have now been served. The carpenters and joiners proposed that the whole of the Borough of West Bromwich should be included in the Birmingham area. It is now expressly excluded, and the association have given notice that the present rule should remain. A proposal has also been made that the wages of carpenters and joiners should be increased from 9½d. per hour to 10d.; but a counter-notice has been given that wages be reduced to 9d. As the local branch of the Amalgamated Society of Wood-cutting Machinists has become affiliated to the Amalgamated Society of Carpenters and Joiners in local trade matters, application has been made for separate representation by one delegate on the Local Conciliation Board, but the association have given notice that the rule remain as at present. In a note to the working rules, it is stipulated that skilled machinists and general sawyers are recognised, and in a reply to a notice for an increase of the wages of skilled machinists from 9½d. to 10d. per hour, and general sawyers and planing machine hands from 8½d. to 9d., the association has informed the carpenters and joiners that they propose to amend the note by providing that the wages of the former shall be the same as those of carpenters, and the latter one penny per hour less. All the notices received from the three branches of operatives propose a substantial amendment to the overtime rule by omitting the words, "at the request of the employer," and also the words: "Overtime shall not be paid until a full ordinary day has been worked, except in cases over which the workman has no control, or time lost, owing to inclement weather." In a counter-notice, the association have proposed that the rule should remain as at present, with the addition of the following words:—"For the purpose of this rule, ordinary working hours shall mean five o'clock all the year round for the first five working days of the week.' The present rules with labourers provide that the rate of wages for builders' labourers shall be 6½d. per hour, and for leading scaffolders 7d. per hour. The Operative Labourers'

Societies have given notice to alter the rules so that the wages of builders' labourers shall be 7d., and of all scaffolders 7½d. The present rule does not apply to excavators, but the operatives propose that the term "builders' labourers" shall embrace "all labourers engaged in the erection, demolition, or repair of buildings, or sewage work, such as bricklayers', plasterers', masons', joiners', plumbers', painters', and slaters' labourers, excavators, millmen, timbermen, and concretors. In response to this the Association have given notice that the rule remain as at present.

SHEFFIELD ASSOCIATION.

Secretary: Thos. Smith.

The question of walking time, on which several joint meetings have been held with the operatives, formed the chief subject of discussion at the meeting of the association, held on November 11th, under the presidency of Mr. Mears. The matter had been thoroughly threshed out by the committee, who recommended the association to accept the proposal contained in a letter from the operatives dated October 21st, viz.: "That 1s. per week shall be allowed for car fares to all men working on jobs over 2½ miles radius from the Sheffield Parish Church, up to 4 miles, men to be on job at the usual starting time." Wages to remain as at present, subject to the addition of the words in the portion within inverted commas: "This rule does not apply to men set on on the job." The committee also recommended the association to confirm its resolution of June 10th, viz.: "That lodging money at the rate of 6d. per night be paid to men sent from the contractors' place of business to work on jobs over 4 miles from the Sheffield Parish Church, except in cases where by mutual agreement it is considered advisable that railway or tram fares in and out be paid in lieu of lodging money, conditionally upon the men being on the job at the official starting time; no lodging money to be paid to men set on on the job." The committee also further recommended the further confirmation of resolution whereby bricklayers would give or take one hour's notice on leaving, the whole of the resolutions in their entirety to be forwarded to the operatives as a full and complete settlement of all questions raised on the notices of the association of September 1st, and the counter-notices from the operatives.

After a short discussion the association unanimously adopted the recommendations of the committee, and the secretary was instructed to forward it to the operatives. A reply has now been received from the secretary of the Operatives' Trades Committee, saying that the suggestions are not acceptable to them, and that he is placing the matter before the operatives' section of the Local Conciliation Board, with a view to the matter being considered at a joint meeting as early as possible.

It is hoped that the Conciliation Board will be able to adjust the little difference which now divides the parties.

GREAT YARMOUTH ASSOCIATION.

Secretary: Robert J. Hill.

The twelfth annual meeting of the Great Yarmouth Master Builders' Association was held on Tuesday evening, November 30, at the Crown and Anchor Hotel, Hall Quay, Great Yarmouth.

The balance-sheet for the past year was considered to be very satisfactory in the circumstances.

The Secretary reported a saving on the year's working of about £5. He regretted that during the year the meetings had not been attended as they should be, and urged members to attend more regularly during the coming year, as a secretary could not do his work without the co-operation of its members. He announced his intention of resigning the secretaryship, but was persuaded to continue.

On the Secretary's initiative, discussion took place as to the best methods of carrying on the Association, and of securing better attendance, and his suggestion that papers and discussions on matters of practical interest should be arranged, was received with approval.

The following officers were then elected: Councillor F. Grimble, president; G. Chasteney, vice-president; J. Ward, treasurer; Messrs. E. Moore and G. H. Wright, auditors; R. J. Hill, secretary. Committee, Messrs. B. Moore, C. Wiseman, R. Carter, A. Gunns, B. G. Beech, W. T. England, W. Wright, J. D. Harman, L. G. Hadingham.

The secretary was requested to call a committee meeting at the earliest possible time for the purpose of revising the rules for recommendation to a general meeting.

LEEDS ASSOCIATION.

Secretary: J. Davidson.

A meeting of the Leeds Master Builders' Association was held at the Grand Central Hotel, Leeds, to hear an explanation by Councillor G. F. Bowman, on the relative value of the sites for the proposed Agricultural Hall for Leeds. Mr. J. Pickard presided.

Mr. Bowman read a paper pointing out the advantages and disadvantages of the Camp Road and Quarry Hill sites for the proposed Agricultural Hall, in the course of which he advocated the latter site. He contended that the erection of an Agricultural Hall on the alternative site would raise the value and tone of the Corporation property in that district. If the value of the property and the land in the undeveloped area were raised one shilling a yard, it would pay for the cost of the hall.

In the course of a long discussion, Mr. W. H. Dews said the new site was near to the gasworks, and he asked if it was intended to remove those works. There was also the objection that some time must elapse before the scheme could be completed.

Mr. Bowman remarked that it was not intended to move the gasworks, but there were new processes of making gas being adopted, which would remove that objection. Powers would have to be obtained for the erection of the hall on the alternative site. The great object was to get the right scheme.

Mr. Dews remarked that the scheme was too large to be decided upon in a quarter of an hour's discussion, and he could not vote for or against it without further consideration.

Some discussion arose with regard to the restrictions imposed for the housing of the people who were turned out by the destruction of the property, and the provision for lodging-houses.

Mr. Bowman replied that some of the restrictions had been removed, and he thought they would obtain full liberation.

Mr. W. T. Ledgard, in moving a resolution that they looked favourably upon the alternative scheme, said it ought to have the serious consideration of the citizens. The Camp Road site was not the right place on which to erect the Smithfield Hall, because they would have to spend more money on improvements. A million of money had been spent in the other district, and it should be developed to the greatest extent. Mr. I. Atkinson seconded.

Mr. Thomas Clarke suggested that the meeting should condemn the Camp Road site, but this met with no support.

The resolution was carried with one exception, and a vote of thanks was accorded to Mr. Bowman for his paper.

During the afternoon Mr. Bowman submitted his scheme to the Council of the Leeds Architectural Society, and although no resolution was adopted, the feeling is said to have been favourable to the scheme, and that it was deserving of serious consideration.

HARTLEPOOLS ASSOCIATION.

The annual meeting of this association was held in the Oddfellows' Hall, York Road, West Hartlepool, on Monday, December 6th. Mr. W. M. Thompson presiding over a good attendance of members.

After the meeting had considered the circulars from the Federation respecting the dispute with the quarry-owners and their workmen, and also with respect to the proposed conference between the National Federation and the Institution of British Architects respecting conditions of tendering, the annual report and balance sheet for the year were received and adopted.

The balance-sheet showed a gain on the year's working of over £8, and the amount in hand at the end of the year was considerably over £200. The meeting decided to contribute towards the fund being raised with a view to inviting the National Federation to visit Newcastle in 1911.

It is stated that at the beginning of the year an agitation was begun with a view of trying to get more equitable terms for sub-contractors, and after long negotiations, a form was approved, and a supply procured for the use of the members. It has long been felt that some alteration should be made so as to remove the inconvenience caused by the many varied working hours of the different branches in the building trades, some of the workmen commencing at six and some at 6.30, some ceasing at 4.30 and others at five, some having breakfast before starting in the winter months and others stopping for the meal.

Unofficial negotiations took place between representatives of the Workmen's Societies and representatives of the Teesside and District Masters' Association, and a settlement was almost accomplished without resorting to giving official notice to the Conciliation Boards. This settlement just failing, official notices were given for uniformity of working hours and other alteration to working rules, and it is confidently hoped that the desired amendements with respect to the hours of labour will in the immediate future be agreed upon, and be in operation.

The levy to cover the association's share of the cost of administration of the affairs of the National Northern Centre, Northern Federation, Teesside Association, to which bodies it is affiliated, and to cover its own expenses, was fixed at 4s. per £100 wages paid.

Mr. J. W. Moore was unanimously elected as president for the ensuing year, with Messrs. John Proud and E. M. Tweddle vice-presidents. Mr. E. Moody, secretary and treasurer. Messrs. G. H. Jackson and S. Pearson, auditors. The committee being: Messrs. E. D. Barker, T. Corbett, R. Mothersdale, W. Pearson, A. Stephenson, J. A. Tweddle, W. Thompson, F. R. Turnbull and J. B. Wilson. Messrs. Thos. Beetham, W. Pearson, and Robt. Watt are the trustees of the association. Representatives to the Teesside Association and the Northern Federation were also elected.

The members at the close of the meeting accorded a very hearty vote of thanks to the retiring president, Mr. W. M. Thompson, for the excellent and painstaking manner in which he had discharged the duties of this office during the past two years. Mr. Thompson suitably responded, and expressed the hope that more members would take a keen interest in the work of the association, and aspire to the important position which he had just vacated.

Insurance.

Free £500 Accident Insurance Coupons have this week been sent to the following:—

S. J. C. (Lichfield), S. W. (Walsall), E. K. T. (Littleborough), J. D. H. (Great Yarmouth), H. F. H. (Herne Hill), T. A. (South Shields), J. T. A. (South Shields), R. A. (South Shields), A. V. R. (Manchester), H. S. (Rochdale), A. L. (Plymouth), E. C. (Birmingham), H. A. (Middlesborough), W. H. G. (Birmingham), G. C. (Wakefield), T. E. S. (Wakefield), E. A. E. (Wakefield), W. J. A. (Wakefield), A. H. L. (Bournbrook), G. H. (Burton), B. H. (Birmingham), W. T. (Manchester), J. W. C. (Ruthin), C. F. (Glasgow), A. L. (Regent's Park), P. W. L. (London, E.C.), C. P. O. (Bolton), H. O. (Great Yarmouth), S. H. L. (Cardiff), C. E. M. (Glasgow), G. H. P. (Bilston), J. S. (Kirkintilloch), W. W. (Limehouse), W. G. (Manchester), J. S. (Burnley), F. B. (Hull), W. W. (Wigan), J. S. (Worcester), J. J. W. (Worcester), R. W. H. (Northampton).

NOW READY.

"SPECIFICATION,"

No. 12, 1909-10.

Special Points about the New Edition.

1. It has been very drastically revised and brought up-to-date in conformity with the opinions and suggestions of many well-known Architects and other professional men.
2. A general Index of Special Articles on Planning and Equipment which have appeared in previous issues is included.
3. The information has been rigidly condensed in order to reduce the bulk of the volume, and to make it easier for reference.

The Scope of "Specification."

"SPECIFICATION" provides all the information that professional men require when preparing drawings, writing specifications, or compiling bills of quantities. Previous to its publication such information could only be obtained (and then inadequately) by the consultation of a large number of books.

For Convenience in reference "Specification" is arranged under the usual trade headings of a complete Specification of Works. The book is fully indexed. Model specification clauses are given.

All the sections are contributed by Specialists in the particular branches of the subject of which they treat.

In view of the fact that architects, surveyors, and municipal engineers meet on common ground, and have to deal with subjects very closely allied, information upon municipal engineering subjects is included in "Specification." Architects and surveyors often have to undertake the same work as the municipal engineer, namely, sewerage and sewage disposal systems, road making and water supply, &c. The Municipal Engineer has always been greatly concerned with building construction, and is becoming still more closely connected therewith.

List of Sections.

The information in each section is contributed by a Specialist.

Division I.—Building Construction.

1. General Conditions.
2. Excavator.
3. Drainlayer.
4. Concretor.
5. Bricklayer.
6. Mason.
7. Terra Cotta & Faience Worker.
8. Structural Engineer.
9. Fireproof Constructor.
10. Pavior.
11. Carpenter.
12. Joiner.
13. Ironmonger.
14. Roofer.
15. Ventilating Engineer.
16. Heating Engineer.
17. Founder.
18. Smith.
19. Plumber.
20. Bellhanger.
21. Mechanical Engineer.
22. Electrical Engineer.
23. Marble Mason and Mosaic Worker.
24. Plasterer.
25. Glazier.
26. Painter and Decorator.
27. Paper Hanger.
28. Horticultural and Landscape Architecture.
29. Blind Maker.
30. Furnisher.
31. Art Metal Worker.

Division II.—Municipal Engineering.

32. Roads.
33. Sewerage.
34. Water Supply.

***Accepted.**

Romford.—For erection of a new boiler house and Lancashire boiler, with Galloway tubes, at the Workhouse, Romford, for the Guardians. Mr. H. Harrington, A.R.I.B.A., architect, 65, Bishopsgate Street Without, E.C.:—

Dowsing and Davis, Mawneys, Romford	£1,234	0	0
F. and A. Wilmott, High Road, Ilford	1,220	0	0
Adjustable Cover and Boiler Block Co., Ltd., 64, Victoria Street, Westminster, S.W.	1,219	15	0
J. S. Hammond and Son,* Romford	1,194	0	0

***Accepted.**

Sleekburn, Northumberland.—Accepted for the erection of a new vicarage and parish room, and boundaries, etc., at Sleekburn, Northumberland. Mr. A. B. Plummer, F.R.I.B.A., dioceson architect:—

J. Goulding and Son, Blyth.

Fulwell Hydrated Lime.

A high-class Lime, slaked by a patent process, and packed in bags. Saves the labour of washing and running the lime, will not blow, leaves no waste, may be stored without deterioration and without bursting the bags.

For mouldings and lathwork can be gauged with a much smaller proportion of plaster than ordinary lime.

Converts lime into a safe, reliable and convenient material with the advantages of a bagged plaster.

Further Particulars and Samples from:—

The Exors. of the Late

Sir HEDWORTH WILIAMSON, Bart.,

Fulwell Lime Works, SUNDERLAND.

Shops in the Grand Manner. If, under modern conditions, the small trader is doomed, so, *ipso jacto*, is the small shop. The erection of the Selfridge Store is only one of many portents of the force of the new movement. That the impulse and the inspiration should have come from America is not surprising, a large and new country being naturally addicted to the conception of large and new ideas, and the temper and spirit of the people being impatient of conservative traditions, and apt in the initiation of courageous enterprise. That America is beyond all others the home of the big business building is most strikingly shown in the examples illustrated in our special issue, in which, we venture to believe, will be found much that is worthy of the most earnest attention of British architects, who now find themselves face to face with the necessity of dealing with the new conditions. In this country, the expansion of business is not always met in a free and bold spirit. The prosperous proprietor often seems to lack confidence in his good fortune. Instead of building up to it, he is contented with acquiring the premises next door, and he keeps on doing this until his premises are, architecturally, a "heterogeneous conglomeration of irreconcilable antagonisms." To wait patiently until your neighbours' leases fall in, and then buy them out, may or may not be a cheap way of gradually acquiring a large site for the big building that ultimately becomes inevitable, but a bolder and more wholesale operation would save much valuable time, would perhaps come cheaper in the long run, would offer less temptation to rivalry by bolder spirits, and, above all, would give fairer opportunities to the architect and builder, while sparing the general public the infliction of patchwork premises. That the shopkeepers of Paris are more akin to the Americans in largeness of conception, a further indication has just come to hand with respect to the first of the great emporiums of the Gay City. The Bon Marché is situated on the left bank of the Seine, in the unfashionable quarter, and its proprietors have been long hankering for a site in the centre of the boulevards, where it would make a more potent appeal to wealthy patrons, "especially foreigners," we are told, and of these no doubt the majority are Americans, whose ideas on the great "stores" question are likely to be taken into most careful consideration. Thus we get an interesting example of international reciprocity. It is stated, with reservations, that the proprietors of the Bon Marché have just accomplished a great *coup* in the purchase of the Grand Hotel and the surrounding establishments, including the Café de la Paix, for £2,200,000—perhaps the most commanding site in Paris. If this rumour is true, we are apparently on the eve of stupendous building developments, not only in Paris, but in the capitals of other countries in which so potent an example is sure to be followed as closely as circumstances will allow. It will be, we doubt not, in every respect a noble example, embodying the utmost architectural skill; and architects the world over will await with the greatest interest the confirmation of a scheme that promises almost unexampled opportunities for the combination of artistic grace and business utility.

Italian Gothic. In the "Contemporary Review" for December, Mr. L. March Phillips has a scholarly article on "Gothic Architecture in Italy." The writer has for his chief aim a refutation of the conventional belief that Italian Gothic architecture is "a mere feeble and spiritless imitation of the Northern style, and nothing more." This commonplace of criticism betrays, he thinks, a certain lack of sympathetic understanding. He scouts Fergusson's off-hand remark — since adopted as an article of faith by most Gothicists—that the Italians display "ignorance of the true Gothic feeling," and hints that most of the ignorance that comes into the question is imported by the critics. The Italians were not ignorant imitators; they were conscious adapters. "Italian Gothic evidently knows very well what it is about." It prefers breadth to height, the horizontal line rather than the vertical, and it assumes shape accordingly. This is clearly not ignorance, but self-assertion, representing a racial divergence as between the Latin and the Germanic strains of blood. The writer mentions a few of the "summary dealings" of the Italians with the vertical principle: "Externally the lines of boldly projecting buttresses and flying buttresses mounting in leaps to the abutment of the roof are, in the Northern style, one of the most forcible means of expression of its vertical character. In Italian Gothic these buttresses are either non-existent or are flattened to mere shallow and slight projections. Again, in the Italian style round-headed arches are as frequent as, and are often intermixed with, pointed ones," and while the spire is "the final aspiration of the Teutonic soul," it is in Italy almost always rejected in favour of the dome. The Gothicist will probably protest that these data explain but do not excuse Italian Gothic. Indeed, the author admits that "Italy possibly was mistaken in having any dealings with the style at all," although "Gothic had been adopted in the North with a fervour of conviction which made its influence difficult to resist." It is refreshing to read so judicial and philosophical an article on so controversial a topic; and its appearance in the pages of the "Contemporary" is significant of the revived interest in architecture and the arts.

An Art Essential. The search for the right road in art is perpetual. Luckily no final revelation is possible, and so the pursuit is of endless interest. Mr. Reginald Hallward, speaking on "Essentials in Art" the other day, had a large and distinguished audience, who evidently expected that so individual an artist would regale them with an unhackneyed treatment of his subject. Nor were they altogether disappointed. If Mr. Hallward did not evolve any new truths—which, indeed, were too much to expect from any mere mortal—he nevertheless gave piquant expression to some that are quite old, even if they are not all quite so familiar as the ideas about art that are more generally current. The artist declined to join in the discussion that has followed an exhibition of his own pictures, declaring, with becoming modesty, that the question of the essential principles of art is a much bigger one than anything appertaining to himself, because it is as old as the sculptures of ancient Egypt and Greece. It is probably much older than that, but it is as well not to push these things to extremes, and the speaker's artistic restraint is to be admired and commended. Then he straightway fell foul of the fetish of fashion. As he put it, we are weighed down by the materialism of contemporary life. Doubtless; but does not strong genius always, late or soon, rise superior to that condition? An artist, Mr. Hallward is reported as having said, is condemned if he does not adopt the mode of his time, and ventures to use a language which can give expression to his own feelings. It may be here interjected that if the language is not understanded of the people, the message must perforce fail of its effect—unless, indeed, the new language seems to be worth the trouble of learning, which is very seldom the case. It may well be that that is, after all, the highest form of art which makes the widest and the most instant appeal, provided that the response includes not only the "profane and vulgar crowd," but also the very elect who are not precious and eccentric; for, as Mr. Hallward truly says, "in art is to be found an interpretation of our own lives, and in this way it brings happiness and satisfaction." That is a faithful saying, and seems to us to admit of direct application to the manifestation of art in architecture.

Architectural Oddities.

When the lay Press condescends to notice architecture, it nearly always does it wrongly. For example, a London daily newspaper came out one day last week with about a quarter of a page illustrating "A Squire's Architectural Oddities." The Squire was one Fuller, who half a century ago amused himself by putting up a number of freak buildings in the village of Brightling, which is about nine miles inland from Hastings. Among them are an observatory, which is the most respectable of the collection, and contains in its dome a camera obscura, which, it is alleged, the Squire placed there in order that his tenants might keep observation on their cattle without being put to the trouble of going into the fields; a pyramid in imitation of "Cleopatra's Needle," but built of local sandstone, and reaching 600ft. above sea-level; a "Solomon's Temple," a mosque-like circular structure, with massive marble pillars; and a "Sugar-loaf House," in which the Squire wished to keep a man for seven years, to see what he would look like after being isolated from the world for that period without shaving, washing, or communicating with any human being. Although several "subjects" offered themselves, the authorities would not allow the Squire to carry out the experiment. It is no doubt all very interesting in a crude sort of way; but one would hardly have thought it worth a quarter of a page of a great London daily newspaper. Far be it from us to quench the smoking flax; but we trust that "architectural oddities" do not represent the only sort of architecture in which the public are supposed to take an interest. We have a horrible suspicion, however, that they prefer what is *bizarre* to that which is beautiful.

Architecture and the American Attitude.

Mr. Percy Robinson, F.R.I.B.A., President of the Leeds and Yorkshire Architectural Society, reminded his hearers, in the course of his presidential address this year, that, speaking on the subject of Town Planning last year, he suggested that the local advisory committees proposed to be formed in connection with town planning schemes, might be useful not only in connection with the immediate object in view; the scope of their work he thought might well be extended to watching over the artistic amenities and the evolution of our towns and cities in other directions This idea, he pointed out, has taken a concrete form in New York, where, at the instance of the ex-President, Mr. Roosevelt, following a suggestion made by the American Institute of Architects of Washington, a Council of Fine Arts has been created, and directions have been issued that for the future "before any plans are formulated for public buildings or grounds, or for the location or erection of any statue," the heads of executive departments, bureaux, and commissions must submit the matter to the Fine Arts Council, and follow their advice, "unless for good and sufficient reasons the President directs otherwise." In such an action as this, we have, he thinks, evidence not only of the enterprise of our brethren across the seas, but of their growing appreciation of architectural art, and it is an example that we might copy with advantage. We are afraid, however, that Mr. Taft has been much less sympathetic in his attitude towards æsthetic aspirations

Art and Sentiment.

The great wax bust farce has had one good effect. Its enactment (it is "still running") has drawn from Mr. T. G. Jackson, R.A., an excellent letter to the "Times," and the letter has provoked a leading article in the leading journal. Mr. Jackson points out that the authorship of the bust has nothing to do with its artistic merit. "Being what it is, it would be no better if it were proved to be by Leonardo, and no worse if it were by Lucas." This is cold-drawn commonsense; but, as Mr. Jackson rather grudgingly acknowledges, it discounts the sentimental interest that would pertain to Leonardo, but not to Lucas. In this respect it would, if Leonardo had wrought it, possess, undoubtedly, a certain measure of value, even if it were badly done. It cannot be denied that such sentiment is legitimate and wholesome. Mr. Jackson thinks "it is amusing to see how the merit of the works is forgotten in the dispute about its origin." We submit, however, that the merit of the work does not affect the question, except in so far as it helps to prove or to disprove the authorship, which is the real point at issue. Both Mr. Jackson and the "Times" leader-writer, in their eager championship of pure art, seem rather inclined to ridicule and condemn the form of hero-worship implied in coveting or cherishing the inferior works of great men. "The name of Lucas," says the "Times" writer, "is worth (among dealers) little or nothing, whatever price may have been given for a work of his attributed to an artist with a much more valuable name. This fact proves, what needed no proving, that there are many wealthy connoisseurs who buy works of art not for their intrinsic merit, but for what is supposed to be their authenticity." That is unimpeachably correct, and is perhaps deplorable; but we part company with the writer when he proceeds in this strain: "This state of things reveals an extraordinary timidity in buyers of works of art. If they all trusted their own taste, names would have no value." This would be true enough if one could eliminate from the field the glow of sentiment and the glamour of personality. Such detachment seems to us to be quite impossible. Uproot sentiment, and the love of art comes with it. Not the sentiment, but the excess or exaggeration of it, is to be strongly deprecated, and the unholy trafficking in it is hardly more detestable than the mawkishness which becomes its easy prey. It is necessary to discriminate between the states of mind represented respectively by such loose formularies as "It must be good, So-and-so did it," and by "So-and-so did it. It is bad, for all that; but since he was one of the world's great artists, anything that came from his hands is interesting, whether or not it have intrinsic merit. It is valuable upon personal rather than upon artistic grounds; although, even artistically, it may be valuable as throwing light on the development or the waywardness of genius." Yet, while moderating somewhat on the severity of Mr. Jackson and the "Times," we are at one with them in the condemnation of false values. Sentiment, and the pious afflatus, are very well if they are kept within due bounds—and if accompanied by a due regard for art. When they supersede that regard, and seem to render art a thing of little relative importance, they become as abominable as any perversion and unhallowed exploitation of a natural instinct always must be; and to this extent Mr. Jackson is justified of his timely protest.

The Ambitious Craftsman.

The other evening, the Duke of Argyll, in presenting prizes awarded to the students of the Trades Training School, which is conducted by the guilds of the Carpenters, Joiners, Painter Stainer, Plasterers, Tylers and Bricklayers, and Wheelwrights of the City of London, justly commended the good work that is being done in technical education by these City Guilds. It is indeed excellent—so far as it goes; and Mr. H. Phillips Fletcher, the Director of the Schools, is no doubt justifiably proud of the fact that the schools, which were instituted seventeen years ago, as something in the nature of an experiment, have proved by their continued prosperity the value of the work which is being done. He was also only too correct in the contention that it is impossible nowadays for an apprentice or a young workman to learn thoroughly his trade unless, by means of some such institution as this, he is infused with the vitalising spirit of his craft, instead of being left to welter in some cramping furrow, hole, or corner of it. It is a hard case, and any effort to meet it is commendable. The City and Guilds of London have set an excellent example of practical patriotism—for their energy extends far beyond the bounds to which their title would seem to restrict them, and spreads not only over the entire kingdom, but even beyond it. They are doing perhaps all that they can, and are doing it passing well. To say, however, that it is not enough is to understate the case almost ludicrously. Technical education is a crying national need, and should be placed on a national basis, and should be made compulsory. The youths who volunteer to submit themselves to courses of instruction do so less with a view to personal improvement as a thing to be desired for its own sake, than with the object—against which there is but little to be said—of qualifying for better positions. Generally speaking, their enthusiasm is less for the joy of perfect craftsmanship than for the material rewards of proficiency. Mr. R. Blair, Chief Education Officer of the London County Council, says in a report recently presented, "The scholarship system will have failed in its intention if a good proportion of the scholars do not find their way into industry and commerce," and he points out that this failure is in danger of being realised. Social ambition, and not the honourable desire to become "a workman that needeth not to be ashamed," is the spur of the great majority of the youths who are now being helped in various ways to "better themselves," and it is time to take some effectual means of placing technical education in a truer light. A system which trains a few teachers and develops a few foremen, is doubtless useful in a way; but it scarcely touches the fringe of a most important problem.

Messrs. Horne and Co. (W. E. Horne, F.S.I., W. V. Jell, P.A.S.I., F.A.I., J. R. Lancaster, F.S.I.), announce that in consequence of the demolition of their offices at No. 8, Delahay Street, under the Public Offices Sites (Extension) Act, 1908, they have removed to 35, Old Queen Street, Westminster, S.W.

SOME MINOR ITALIAN ARCHITECTURE.*

Whether we have seen them or not, we all know something of the big things of Italy, and of the works of her great masters in architecture. Possibly in our less heroic moments the big things are apt to seem hackneyed and the big names to pall, so that it is a relief occasionally to turn our backs upon all the grandeur and to dwell for a while on lesser themes.

Varallo, Orta, and Varese.

I propose, then, to bring before you this evening a series of small and hitherto almost unnoticed buildings, the work of obscure or unknown architects, and will ask you to accompany me to a part of Italy which is not famous for any achievement in great architecture, but where the stones cry to us in the vernacular of a district that lie somewhat apart from the main trend of contemporary thought. Varallo indeed speaks but the rude patois of a sequestered valley. By the lake of Orta we may listen to a strain of true lyric grace, while Varese tells its story in unmistakable prose, a little turgid and artificial as befitted the times, but not without interest.

If you draw a line across the map of Italy westwards from the town of Como, twenty miles will bring it to Varese, situate among the low foothills just where the mountains fade away into the great Lombardy plain. Go miles further on, after crossing the lower arm of Lago Maggiore it will pass through the town and lake of Orta, and at a point some 60 miles from its starting-place Varallo is reached, in the deep and wooded valley of the Sesia, a river which rises among the glaciers on the western flanks of Monte Rosa. The connecting-link between these three places is that each possesses a noted sanctuary in its Sacro Monte, or Holy Hill, and it is more particularly of these sanctuaries and the buildings which they comprise of which I propose to speak.

Imagine a glassy and undulating slope on a wooded hill, dotted with chapel-like buildings that gleam among the tree trunks, or stand out white against the sky, imparting a character of architectural romance to the whole mountain-side. Provide them with porticoes under which are grated view openings to the interior, vary the plan, size and design as fancy directs, and you have the general appearance of a Sacro Monte.

The Holy Hills.

Let us begin with the Sacro Monte of Varallo, that being, so far as I am aware, the first thing of the kind to be attempted. Its inception was due to a Franciscan friar, Bernardino Caimi, of noble Milanese family, who had been appointed Commissary of the Holy Places in Palestine by Sixtus IV. He returned home in the year 1481, and partly in grief at the neglected condition in which he found the sacred sites, partly with the wish to edify those of his countrymen who had not the opportunity of travel, determined to found a New Jerusalem in his native Lombardy, to contain, as its central object of pilgrimage, a replica of the Holy Sepulchre. Careful search among possible sites indicated the hill that overhangs Varallo as the most convenient for his purpose; and the foundation-stone of the Holy Sepulchre Chapel was laid in the year 1491.

Caimi started with the idea of reproducing the Holy Sepulchre, and probably certain other holy places, as Golgotha and the Grotto of the Nativity. But as the work proceeded the idea developed into commemorating the events of the Sacred Narrative by groups of life-sized figures, so that there are now forty-four chapels upon the Sacro Monte. We call these little buildings chapels for want of a better word, but they are not built or fitted for religious functions of any kind, but solely to shelter these groups of painted imagery which form in conjunction with their frescoed backgrounds tableaux of the Redemption story

Leonardo the Innovator.

Samuel Butler (whose "Alps and Sanctuaries of Piedmont" is one of the most delightful books of Italian travel) conjectures that the original idea of these representations in which painting and sculpture are combined with the realism of a scene on the stage, may have been suggested to Caimi by the great innovator Leonardo himself, who was in Milan at the time the scheme was projected. But in truth the whole idea was essentially mediæval, akin on one side to the miracle play, and on the other to the groups of coloured figures familiar to us in the altar-pieces of Northern Europe. In the earliest examples the figures are of wood, the latest are of stucco, but those of the best period are of terra-cotta. All are painted—nearly all, alas, repainted!—by the nearest house-painter or professor, which comes to pretty much the same thing, with rouged cheeks and staring eyes.

Crude Realism.

For canopies, hangings, and so forth, real drapery is introduced, and the figures have wigs of hair or dyed flax. There is no shirking realism so far as it may be had.

The first sight of these groups is certainly something of a shock. There is a sense of theatrical convention, of self-defeating realism; of the lifelessness that comes from arrested movement, as of a stage full of paralysed marionettes. This is the first impression. But if we complain of staginess, we must bear in mind that this is an attempt to put a scene upon a stage. It is a perpetual miracle play, a mediæval mystery without words or action. This intention must be recognised, and its resultant conventions accepted before we can judge fairly of the way in which it has been realised. It is both easy and obvious to talk of waxworks and Madame Tussaud. All coloured sculpture, even that of the Greeks, is obnoxious to this form of criticism. But what is really at fault in the majority of the groups is the coarse and tasteless repainting which they have undergone. Nor have time and weather been much kinder than the house-painter, and the scaling, blotching, and blistering of the paint, especially of the flesh tints, and the secular incrustations of dust and dirt, have given some of the figures "a diseased and mangy look," as Butler says, "so that there is not a chapel which does not require some effort of the imagination before the mind's eye can see it as it was left by those who made it." But, after all, the strongest motive for suspending judgment and looking a little below the surface is the respect due to the great artists who took part in these works, viz., the three brothers D'Enrico, of Alagna, the great Fleming Tabacchetti, and Gaudenzio Ferrari himself; the last of whom "ranks as among the few purest and most accomplished artists of the very culminating periods of Italian art; so that what he thought good enough to do may be well worth our while to consider with the best attention we can give to it." Such at least is the opinion of the eminently sane critic I have just quoted. However, it is not my intention to discuss the sculptures, and I have only said so much because it was impossible to speak of the chapels without alluding to that for which they exist. At Varese and

WALTER H. BRIERLEY, ARCHITECT.

Orta we may leave the contents of the buildings out of count altogether, but at Varallo there are both frescoes and sculptures which undoubtedly take a high place among the works even of that great period, the Cinquecento.

The Sacro Monte rises precipitously to a height of about 500ft. above the little ones, and is approached by a paved and well-graded path overshadowed by the chestnuts with which the flank of the hill is covered. When the top is reached the first impression is a bewildering one, as of an inconsequent and haphazard jumble of chapels. But even when many hands and many minds have laboured on a piece of work, and at long intervals of time, that is not the Italian way. As a matter of fact, buildings went on at irregular intervals during a period of two centuries and more. Over forty chapels had to be huddled on to a small, irregular, and *accidenté* piece of ground; they had to be approached in a certain order, and no architect of repute, except the rather second-rate Alessi and Tibaldi, were employed. Yet the result is what we see.

The Italian Garden.

When the sanctuary was first projected, it was doubtless impossible to foresee to what an extent the scheme would develop. So it came about that as new chapels were founded from time to time they were built on convenient spots, with due regard to æsthetic requirements, but without much consideration for the chronological sequence of the events commemorated. Towards the close of the sixteenth century, Tibaldi was commissioned to prepare a plan to remedy this confusion, and though little or nothing in the way of building can be attributed to him, the arrangement of the connecting path by which the chapels are linked in their proper order seems to have been his. The sinuosities of this path are far more judicious than the serpentine meanders of the Jardin Anglais, and there is much of the characteristic charm of the Italian garden in the lay-out, in which we include the length of time required to find out how small the area of ground covered really is. The path, of course, is cobble-paved with cross ribs of granite to afford foothold where the gradient is steep. It is bordered with trim hedges of box and beech; chipped shrubs and stone seats are set in the right places, and the chapels themselves supply points of interest at every turn of the way.

The walls are plastered, the columns and dressings of grey granite, a combination equally charming and appropriate whether among the bleak Breton moorlands or on the wooded slopes of these riant Alpine valleys. Much, of course, will depend upon the texture of the plaster, and we may trust the Italian even now to get an interesting surface in that material.

Beautiful Roofs.

The fine stone slabs with which the roofs are covered would suffice to confer a sort of dignity upon the meanest shed. Owing to the absence of coursing they have a curious appearance of having been thrown helter-skelter on to the roof, and though doubtless they lie closer than they seem to do, and there must be no little method in the madness of their laying, it is not easy to see how they manage to exclude the searching snows of winter.

In beauty of colour and texture these roofs excel, if that were possible, the stone roofs of the Cotswolds, and to one looking down from the Sacro Monte upon the huddled houses of Varallo, the little town seems clothed in mouse-coloured velvet, with an occasional patch of tiling to give the effect of rose-coloured rivers.

Two Systems of Planning.

In the erection of the chapels two systems of planning have been followed. The earlier were built upon a simple quadrilateral plan, divided by a screen into two compartments, the inner for the sculpture, and the outer for the accommodation of the pilgrims. In the later examples the entire space is given to the representation, and an external portico is attached to shelter the spectators, with grilled openings to the interior.

Interesting Screens.

The screen is often the most interesting part of the building. The upper part is usually glazed with nice old glass of pleasant tint and texture. Below is an oblong grille of carved wood, the upper part sometimes canted to afford a comfortable view of the wall and ceiling paintings. These wooden lattices are a peculiar feature of Varallo, as the iron grilles are of Orta.

The highest point is a rounded knoll, the summit of which is occupied by the chapel of the Transfiguration. This is a huge plain drum 40ft. in diameter and of considerable height; in itself bald and unsatisfying. But note firstly the charming contrast afforded by the porch with its delicate coupled columns and interesting entablature; and secondly, it should be borne in mind that these chapels are not so much isolated objects as parts of a composition. The architects of the seventeenth century at their worst were usually good scene-painters, who thoroughly grasped the art of grouping and of producing striking effects. It was probably their feeling for scenic propriety which led them to adopt the circular or polygonal plan whenever they had to build a chapel on an eminence. Orta and Varese supply numerous examples of this preference.

Grouped Chapels.

The concluding chapels of the series are grouped together near the edge of the precipice overlooking the town, so as to form a sort of piazza. One side is occupied by the large church of the Assumption, the other three by a picturesque medley of chapels, cloisters, and loggias. The church has an intolerable modern facade, gaudy and pompous; in most unpleasing contrast to the quiet beauty of the rest.

Three large chapels, containing respectively the Nailing to the Cross, the Crucifixion, and the Deposition, form an important group in the south-east corner. They are raised partly on a lofty substructure, partly on the native rock. A loggia extends along the front, approached by a flight of steps at either end. The first and last contain notable works by G. d'Enrico. In the Crucifixion chapel both sculpture and paintings are by Ferrari. "No finer works of their kind have been preserved to us," says Butler. Be this as it may, no one who knows Saronno, or has even glanced into the Church of S. Maria delle Grazie at the foot of the hill, will doubt that he is in the presence of a really magistral work—devout, manly, and dignified. As you turn from this you are faced by the light colonnades of the Scala Sancta, an immitation for pilgrimage purposes of the Roman original, by which we may ascend to the upper cloister to enjoy another view over the piazza, and a wonderful outlook through the clairvoyées at the back up the valley of Lesia, with Monte Rosa's snowy summit closing the distance.

Taken as a whole, the chapels of Varallo must be pronounced inferior in delicacy and refinement to the best of those at Orta, and in grandeur and scenic picturesqueness to those at Varese; but in simplicity, variety, and skilful grouping they are hard to beat. Moreover, and this is perhaps their greatest

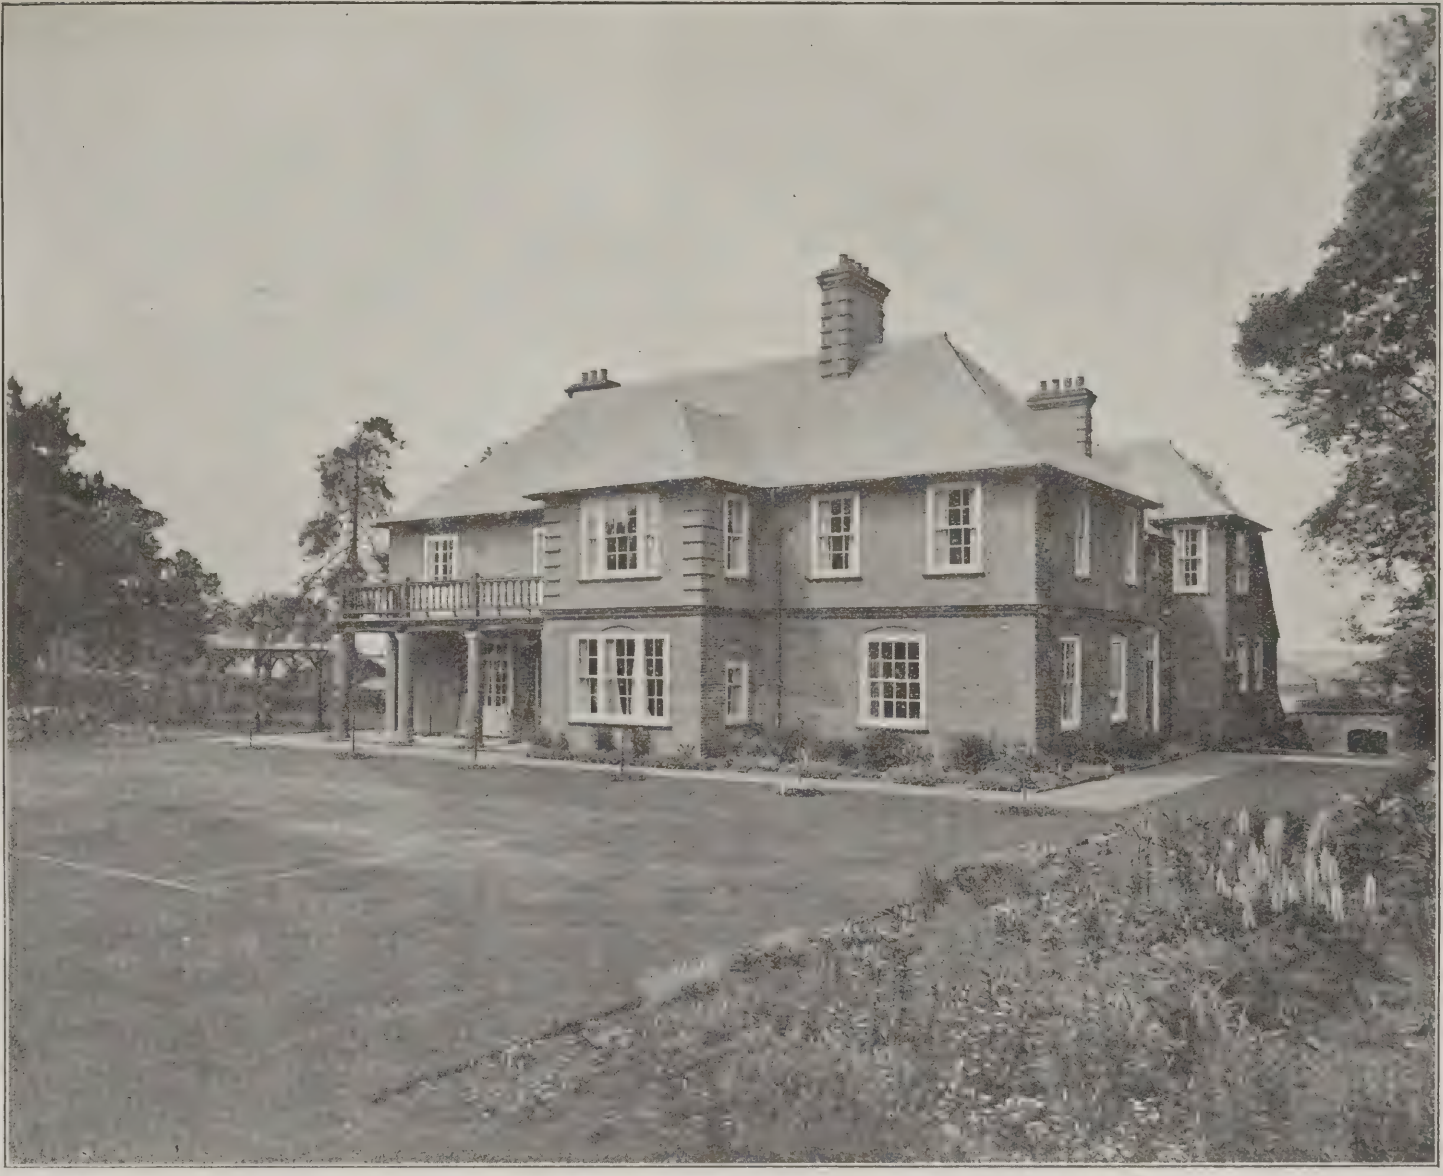

Photo: T. Lewis.

MEDICAL SUPERINTENDENT'S HOUSE, THE RETREAT, YORK. WALTER H. BRIERLEY, ARCHITECT.

This house is built of 2-inch hand-made bricks, with cavity walls, and the roofs are covered with half-inch rough Westmorland slates. The exterior woodwork generally is of redwood, painted, with the exception of the veranda balcony, which is of English oak.

merit, they are entirely suited to their situation and use. The gentlemanly elegance of Orta and the pomposity of Varese would alike have been out of place amid these sunny Alpine pastures, where such beauty alone need be sought as comes from that harmonious blending with nature which ever rewards the unaffected use of those materials which come readiest to hand.

The Sacro Monte of Varallo was, as I said, the first and for about 100 years the only thing of its kind. But in 1583 we have the first notice of a sanctuary being in contemplation at Orta. Here again the inspiration came from the Franciscan Order, and was probably suggested by a visit of S. Charles Borromeo to Orta on his return from Varallo.

The single narrow street of which the little town of Orta consists runs along the shore of its lake, at the foot of a steep promontory which projects nearly half-way across the water. Its summit is occupied by the sanctuary. Here are a monastery and twenty chapels, standing in a sort of wood, intersected by grassy glades and commanding exquisite and everchanging views of lake and mountain.

The entrance arch is approached by a cobbled path bordered by cropped limes. It is surmounted by a figure of St. Francis, in whose honour and to depict the scenes of whose life the chapels were erected.

Granite, Plaster, and Marble.

The materials employed here are the same as at Varallo, namely, granite and plaster, but with the addition of a dark serpentine marble, which takes the finest detail, and is used with excellent effect for the smaller moulded members, as caps, bases, and architraves.

The lay-out differs from that of Varallo, inasmuch as the chapels have been placed so as to get the best effect from each separate building, rather than with an eye to picturesqueness of grouping.

All the best chapels were erected between the years 1591 and 1630. Dr. Goldhardt—to whose pamphlet I am much indebted—discusses the authorship of these words, and attributes them on evidence which seems fairly conclusive to a Franciscan, Padre Cleto, of Novara. He draws attention to the significant fact that the style is old-fashioned, in fact, about a century behind the times; and suggests the inference that the designer was an amateur of Classic architecture, uninfluenced in the seclusion of the cloister by current movements and fashions, and this by no means to the detriment of his art.

Figure Groups.

In contrast with the sculptures at Varallo, the figure groups here are of no account; "feeble silly cant," Butler calls them; nor is the arrangement of the darkish interiors so well adapted for their display. But all the more worthy of attention is the outside treatment. Delicacy, economy of means—in many cases the cornices and other members are reduced to their most rudimentary forms—elegance of proportion, these are perhaps the most outstanding notes.

We now come to two more important chapels. They are both simple oblongs surrounded by colonnaded loggias, and it is interesting to observe how from very similar plans two utterly different buildings grow.

The first, known as the Madonna of the Angels, from the trumpeting angels on the roof, is the most ornate of all. The facade is charmingly composed, and for its date (1606) most refined in detail.

Concealed Art.

The fifteenth chapel, which has been so oddly connected with the name of Michelangelo, is one of those simple, inevitable, and masterly designs wherein consummate art lurks artfully concealed. The attribution of the authorship to the great Florentine master is, of course, worthless, except as evidence of traditional admiration. It is difficult to imagine anything more remote from the austere grandiosity of Michelangelo's manner than the Mozartian urbanity and grace of this little building.

We are now on the highest point of the Sacro Monte, and are, therefore, prepared to find, as at Varallo, a circular chapel. The plan is of the utmost simplicity—a plain drum surrounded by a peristyle of twelve slender Doric columns bearing semicircular arches. The stylobate is broken at the cardinal points by flights of steps for access to the ambulatory which is roofed with a lean-to. This plan is the earliest example (1597) of a central block surrounded by a portico, and exercised considerable influence upon the later chapels both here and at Varese. Henceforth all the more important ones display this feature.

The eighth chapel is obviously a variant upon the same theme, the octagon being taken as a basis instead of the circle. It is clear from the plan that the ambulatory involved the designer in sundry difficulties. The arches, if only eight in number, would become sprawling and ill-proportioned unless they could be carried to an extravagant height. The difficulty has been overcome by a similar device to that so often employed in the aisle of a Gothic apse, viz., by the division into alternate square and triangular spaces, producing thereby a sixteen-sided ambulatory.

Mastery of Resource.

In a small late building like this, by no means one of the best of its kind, one is surprised at the feeling for effect, the unerring knowledge and command of every device whereby the desired effect is produced, the freedom in handling difficulties. The squares I spoke of just now in the plan of the ambulatory are not squares, the sides incline inwards towards one another, that was dictated by the proportions of the arches (and an Italian mason is not one to bungle over the irregular vault thereby produced); nor are the faces from which the cross arches spring parallel; that gets over another difficulty; true, it lands you in a winding arch, but as that is only in plastered rubble nobody's bones are broken. By-and-bye we shall see another way in which the difficulties of an octagon surrounded by an arcaded loggia were faced at Varese.

I have dwelt thus at length on the plan of this chapel because, in spite of certain signs of debasement, it is a fair example of the skill with which these obscure masons handled their "Renaissance box of bricks."

Baroque Influence.

The next chapel is elliptical in plan—sure evidence of Baroque influence, and the porch seems stuck on.

Inside there is a good iron screen. There must have been a school of excellent smiths in this district. Almost every house in the town has a good iron balcony, and the neighbouring villages and churches are rich in ironwork, as well as the Sacro Monte itself. Even when the design is a little riotous the workmanship is careful, and even precise.

The doorway from No. 10 is of the same date as the entrance arch, and is not a bad example of the use of the black serpentine. It was interesting to find that the capitals are copied from an antique in the old church of St. Giulio on the island. This chapel also has a fine grille, of which it was possible to photograph the central portion.

One of the most charming structures here is the little well-house. The pedestals and caps are pentagonal, which is, I suppose, the only way of getting comfortably round an octagon.

Varese.

The town of Varese is situated on the verge of the plain of Lombardy. About three

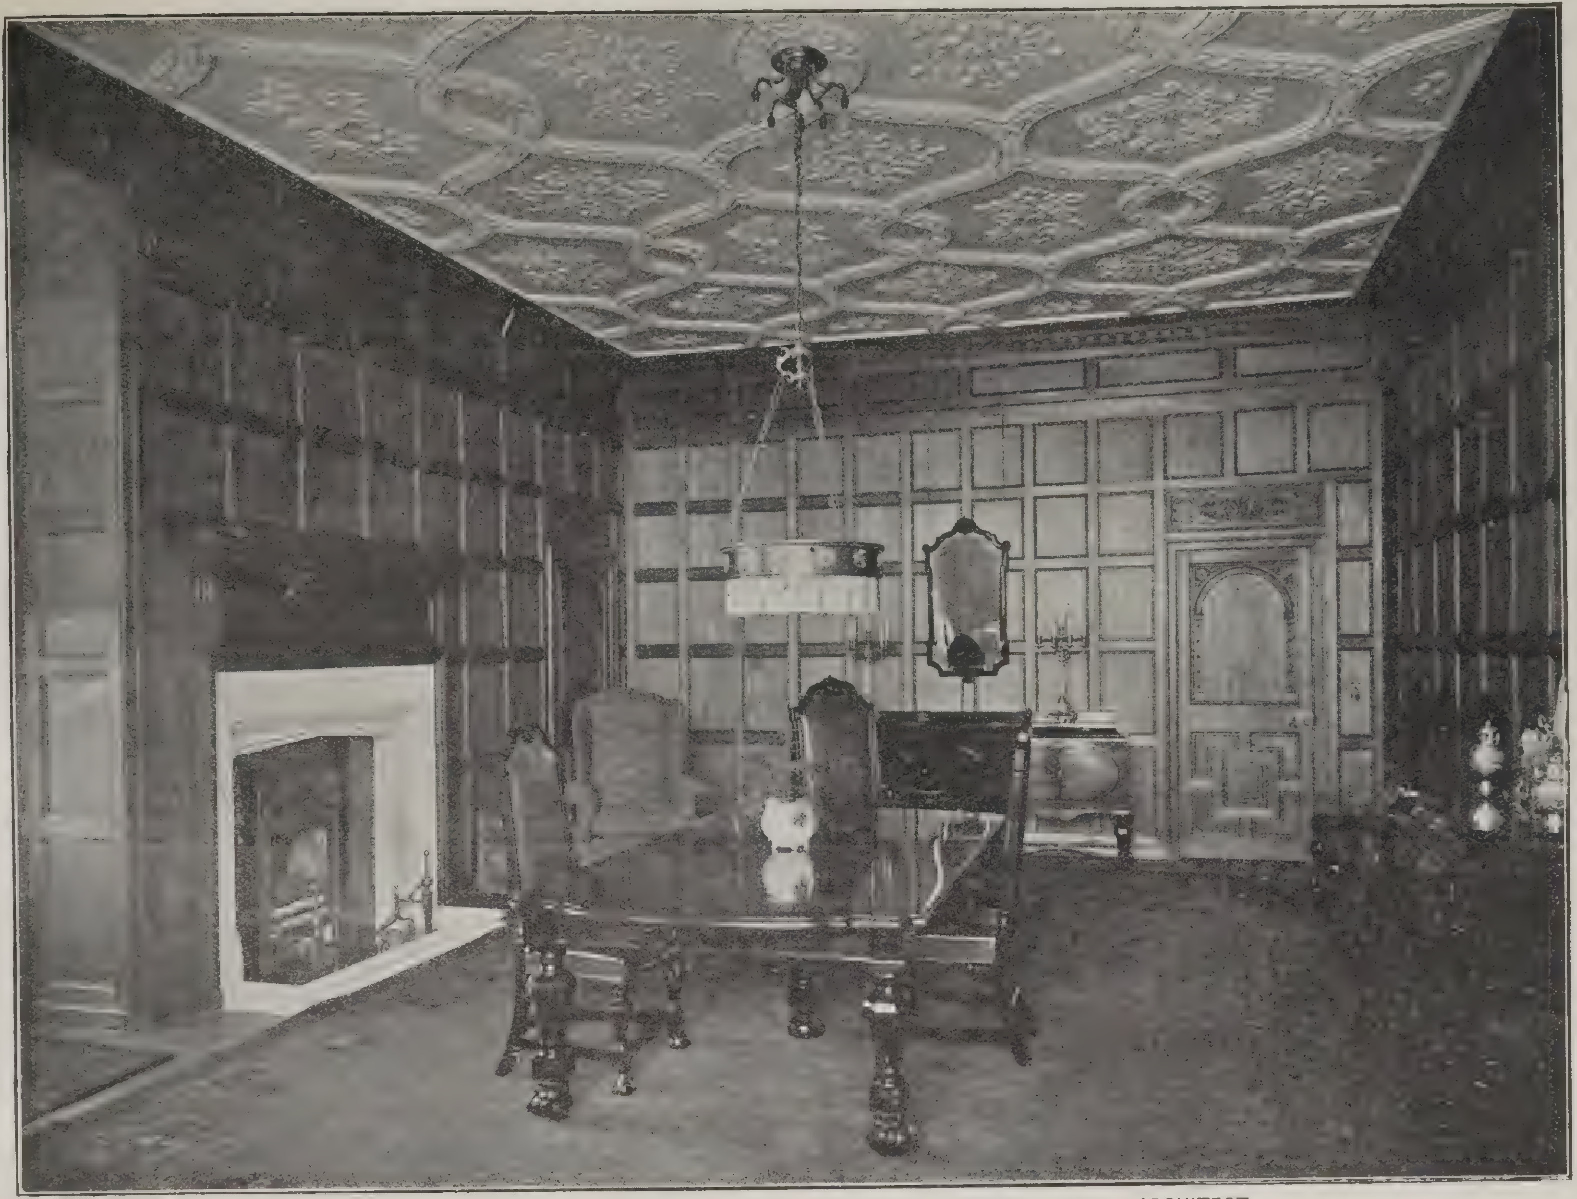
MEDICAL SUPERINTENDENT'S HOUSE, THE RETREAT, YORK. WALTER H. BRIERLEY, ARCHITECT.



RAVENSCOURT, THORNTON HALL: THE DINING ROOM. ROBERT WHYTE, ARCHITECT.

The dining-room is panelled in kauri pine from floor to ceiling. The grate and electric fittings are armour-bright, with ornaments of brass. The furniture is of mahogany, and was specially designed for this room. The fireplace is of Painswick stone.

miles to the north, in the direction of the mountains, is the entrance of the Sacro Monte.

The general scheme is quite different from what we have seen before; the chapels are not grouped in a confined space, but follow a broad paved road which ascends in zig-zags along a rising ridge. A chapel is placed at each turn of the road, and intermediately wherever a long straight run occurs. The road is perhaps 2½ miles long, and is the main approach to the ancient hill town of St. Maria del Mönte, which occupies the summit. The construction of the road was contemporary with that of the chapels, and no little skill and feeling is shown in its disposition and planning. Not only had it to follow the line of least resistance, so far as climbing the hill is concerned; but it is so schemed that the chapels show to the best advantage from below, and also provide the best points of view for the enjoyment of the landscape.

Bernascone of Varese.

Again a Franciscan was the originator of the scheme, the execution of which was entrusted to the architect Bernascone, of Varese. There are fifteen chapels, in illustration of the mysteries of the Rosary, each group of five being separated from the next by an arch and fountain. With the exception of five late and unimportant buildings all are Bernascone's work, and show him to have been a man of considerable imaginative and inventive power. Though begun only ten years later than Orta, it is quite 100 years later in manner. If the chapels there were the work of a refined and gifted amateur, here they suggest the professional man, quite up to date and to all the tricks of the trade. A marked difference is observable at once in the colour of the buildings; we have exchanged the stone roofs and whitewash of the mountain valleys for the tiles and yellowish stucco of the plains. Granite is more sparingly used, and the increased use of stucco instead of stone for ornamental features gives a sort of coarseness that smacks of a declining art.

The plan of the first chapel is similar to two of those at Orta, viz., a colonnaded portico round three sides of an oblong cell. But here the elevations suggest a Classic temple. We now find for the first time view openings in the sides of the building as well as in front. In this case they are rather prettily treated.

The second chapel is insignificant, and at the first turn we come to No. 3. Here importance is given to the side openings, which become regular transepts. Their treatment is, however, much more successful in the next chapel, which is designed like a domed church on the plan of a Greek cross, the transepts and aisles being as it were turned inside out.

The external division of the copper-covered dome into eight unequal segments is noteworthy; the wide divisions corresponding to the transepts, and the narrow to the interspaces. The undue width of the broader divisions is cunningly counteracted by the keel-like form given to them.

Masculine Work.

Immediately opposite this last is the most important building of the series. It is also the most complicated both in plan and design, but is a fine masculine piece of work, which, as I found on my second visit to Varese, improves greatly upon further acquaintance. The transeptal form of plan is again adopted, in this case grafted upon an octagon. The transepts instead of being connected by arcades, are joined merely by balustrades, which play a curiously important part in the elevation, as you will see. At first sight it is impossible to believe that they are horizontal. Their raking lines seem to buttress the main portico with a studded effect of support, and cause the whole building to sit securely on the side of the slope. The illustion in increased by the want of parallelism between them and the main block, so that in perspective their lines vanish to different points. You will observe what excellent effect is obtained by tiling the cornices; how by this simple means a very strong line may be produced without unduly coarsening the mouldings.

At the next turn of the road the town on the mountain-top comes into view with something of a shock. The chapel of the Flagellation at this spot has certain good points; a life-size Pieta, most effectively placed over the portico, and some pretty plaster work in the vault.

The road now ascends rapidly along the side of a deep valley to the Crucifixion chapel, with an interesting porch surmounted by a delicate pierced iron cross, designed to silhouette itself against the whiteness of the wall behind.

The ironwork here is not quite up to the Orta level. It is often enriched with bronze ornaments which have acquired an exquisite patina.

The plan of the Ascension chapel is interesting; an elongated octagon within and an ellipse without, to which is attached a large portico, a sumptuous piece of Baroque design.

The last chapel of Bernascone's is very simply planned.

Perils of Simplicity.

"Ah, me! what perils do environ the man that meddles with" simplicity. It looks so inevitable, and is so full of pitfalls. The vaults of the ambulatory are barrels decreasing both in width and height inwards, sections of a cone, in fact; and the arches which separate them follow the lines of the pilasters from which they spring, so that an angle runs along the soffit, salient for half its circuit, and re-entering for the other half, and just disappearing at the apex.

Discussion.

Mr. Theodore Fyfe proposed a vote of thanks to Mr. Eden, and observed that the examples of architecture which had illustrated the paper were distinctive in character, and possessed a fine early Renaissance feeling. Referring to a building which Mr. Eden had said was generally attributed to Michel Angelo, a theory in which he (Mr. Eden) placed no great faith, the speaker was more inclined to credit the authorship to Bramante. The value of paint was fully realised by the Italians, and applied to their sculpture with characteristic method. Mr. Percy E. Newton seconded the vote of thanks, and said that he had the pleasure of accompanying Mr. Eden on his first visit to Orta. It was a delightful spot; the lake was very quiet, and the locality formed an ideal place for a holiday.

Mr. H. H. Statham supported the vote, and remarked upon the interesting variety of treatment manifested in the plans. It would appear that the architects had formed their plans with but small consideration for the treatment of the superstructure. Mr. Eden's paper was one of the most interesting architectural lectures that he had heard for a long time.

Mr. Arthur Keen, speaking in support of the vote, said that what had struck him most was the wonderful beauty of the detail, which, perhaps, had been left more to the craftsman than to the architect, with, he thought, eminently satisfactory results. He referred more particularly to the detail of the iron grilles.

Mr. Gerald Horsley also supported the vote of thanks, and enquired of Mr. Eden whether Ferrari had designed any buildings. He knew that he had executed several groups in terra cotta, and had, he believed, also painted the background on the walls of a chapel, in fresco.

The Chairman (Mr. C. Wontner Smith) said that he had been to Italy once or twice, but never in the direction of Orta.

Mr. Eden responded, and thanked them for the very kind reception of his paper. Ferrari, so far as he knew, had never acted as an architect. His best group was certainly the one in the Crucifixion Chapel.

DRAIN OR SEWER?

From a Legal Contributor.

Questions often arise as to whether a particular pipe carrying sewerage is a drain or sewer. The importance of the matter lies in the fact that, broadly speaking, the local authority is liable to repair and maintain the sewers.

Inasmuch as it is practically impossible to deal with individual cases without a survey of the whole question, it is proposed in the present article to discuss material sections of the Acts of Parliament dealing with the matter, and the more recent cases which have been decided with reference thereto.

The definition of the words "drain" and "sewer" is statutory. Under the Public Health Act, 1875, section 4.—

"Drain" means any drain of and used for the drainage of one building only, or premises within the same curtilage, and made merely for the purpose of communicating therefrom with a cesspool or other like receptacle for drainage, or with a sewer into which the drainage of two or more buildings or premises occupied by two different persons is conveyed.

"Sewer" includes sewers and drains of every description except drains to which the word drain interpreted as aforesaid applies, and except drains vested in or under the control of any authority having the management of roads and not being a local authority under this Act.

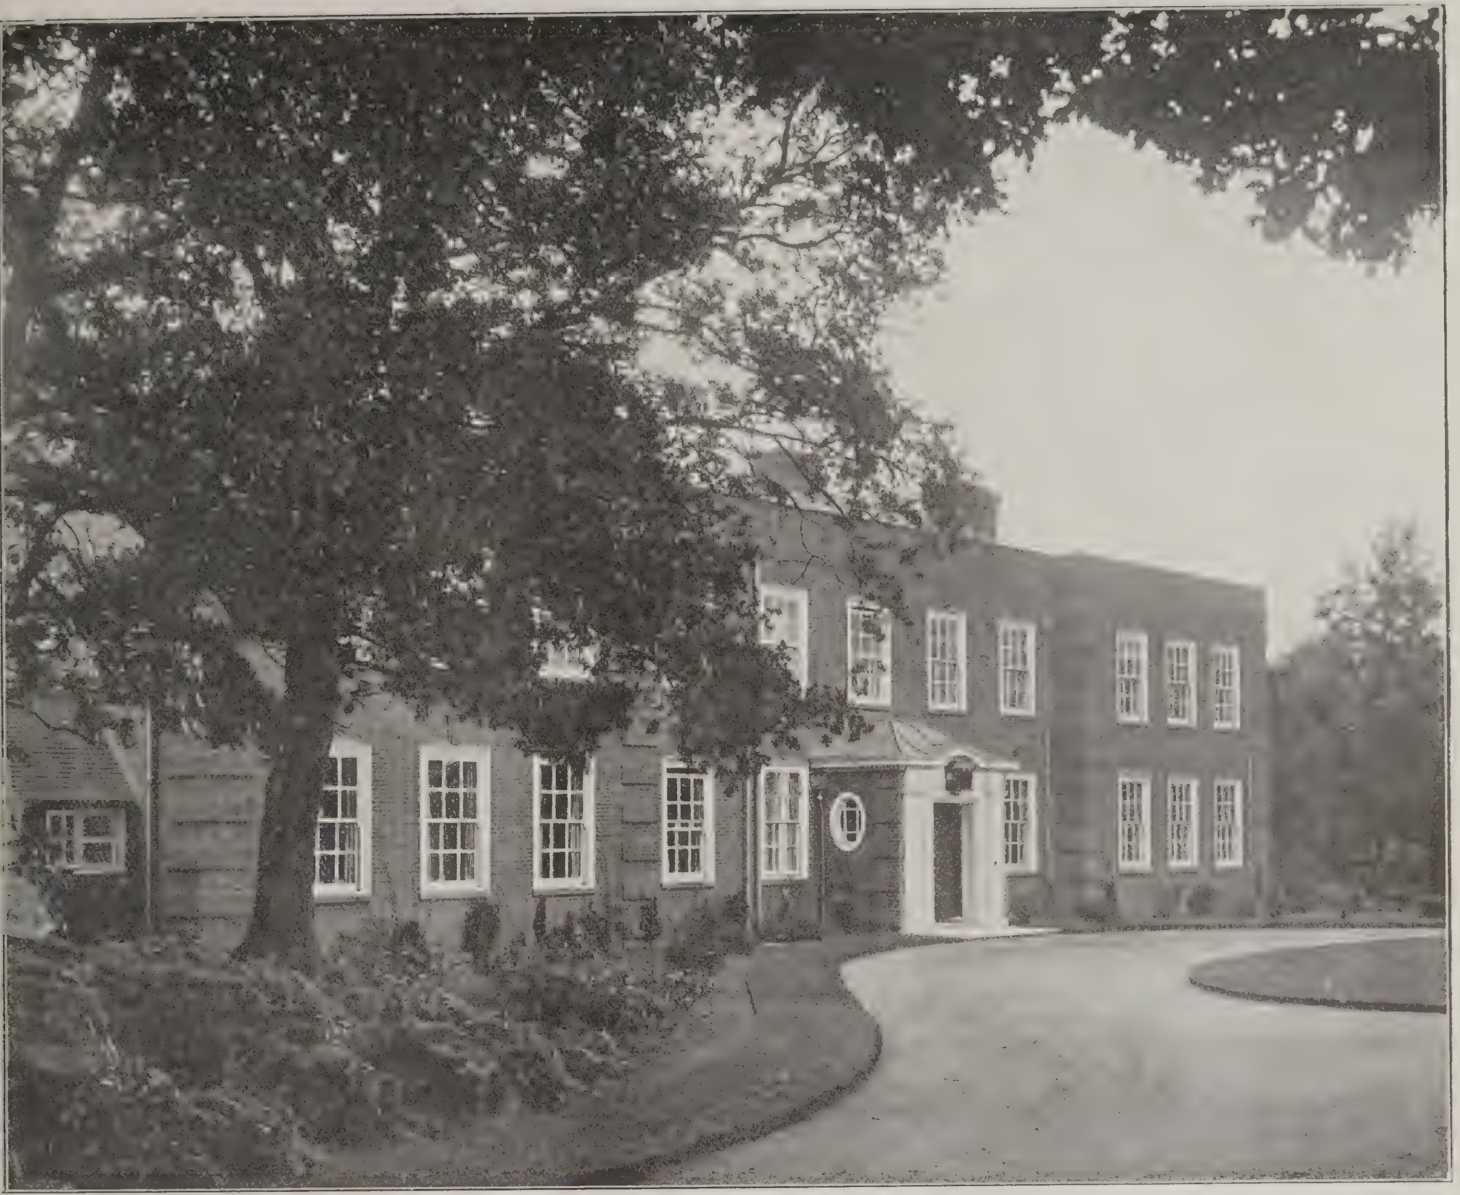
It is necessary to understand that there is a fundamental distinction between a drain and a sewer. A drain is made by a private person for private purposes: it is usually made in private land, and is not intended to be used by other persons. Where, however, it comes to be used by someone else the tendency is for it to become a sewer. Upon the question as to when it does so become a sewer extraordinary judicial difficulties have arisen.

Take first the case of *Travis v. Uttley*, 1894, 58 J.P. 85. In that case a drain ran under three houses. It passed through the basements and received the drainage first of one and then of two other houses. Mr. Justice Wills, in the course of his judgment, said: — "It is impossible to say that the part which is used for the drainage of one building is a drain, and the rest a sewer. The drain is a sewer from end to end." But it is material to notice that in a later case (*Beckenham U.D.C. v. Wood*, 1896, 60 J.P. 490) the learned judge withdrew this opinion. In the latter case it appeared that a pipe or line of pipes received the drainage of more than one building not in the same curtilage. It was held that it was a sewer *below* the point at which it received the drainage of more than one building, but that it was a drain and not a sewer above that point.

The startling anomalies to which the decisions on this matter have given rise may be further exemplified by the case of *Holland v. Lazarus*, 1897, 66 L.J.Q.B. 285, which arose under s. 250 of the Metropolis Management Act. In that case a drain for the drainage of four houses by combined operation was constructed under the authority of a vestry. A pipe which carried off rainwater from the roof of a fifth house was without the sanction of the vestry turned into and connected with this drain:—It was held that, the rainwater pipe was a drain, and that its unauthorised connection with the drain belonging to the four houses converted the latter from the point of junction and onwards into a sewer.

In a later case (*Silles v. Fulham Borough Council*, 1903, 67 J.P 273) Vaughan Williams, L.J., pointed out that it makes no difference although one of the two drains happens to be a drain which only carries rainwater, and that the drain which carries off the water from one building and the sewage from another building equally comes within the definition of "sewer."

The extraordinary result of the foregoing cases is that a drain may become a sewer "unbeknownst" to the local authority. If



HOUSE NEAR FARNHAM, SURREY. NIVEN, WIGGLESWORTH AND FALKNER, ARCHITECTS.

This house, an example in the modern Georgian manner, is built in red brick, with stone dressings to the porch, brick quoins relieving the surface at the corners of the bays, &c: The windows are of wood, painted white, The bricks are 2 in., carefully selected for colour. The result is most subdued; an effect of great quietness was aimed at, and, it is believed, has been attained.

one man connects his drain to that of his neighbour, the part which leads their joint sewerage to the sewer may become repairable by the local authority.

The next important section to consider is s. 19 of the Public Health Acts Amendment Act 1890, which provides as follows: (1) Where two or more houses belonging to different owners are connected with a public sewer by a single private drain, an application may be made under section 41 of the Public Health Act, 1875 (relating to complaints as to nuisances from drains), and the local authority may recover any expenses incurred by them in executing any works under the powers conferred on them by that section from the owners of the houses in such shares and proportions as shall be settled by their surveyor or (in case of dispute) by a court of summary jurisdiction.

(2) Such expenses may be recovered summarily or may be declared by the urban authority to be private improvement expenses under the Public Health Acts and may be recovered accordingly.

(3) For the purposes of this section, the expression "drain" includes a drain used for building.

The simple application of this section would seem to be that where there are six houses in a row all belonging to different owners, and the drain which runs under them all is connected with the sewer by a pipe, that pipe is a single private drain, and the owners may be called upon to pay as laid down in the section. What, then, is a "single private drain"? It turns upon the question whether the houses which it drains are owned by one man. The case of *Jackson v. Wimbledon U.D.C.*, 1905, 69. J.P. 225, affords a striking illustration. In that case twelve houses forming part of a crescent, numbered with odd numbers from 51 to 73, were the property of one owner, No. 75 belonging to another person, and Nos. 77 to 81 to a third person. At the rear of these sixteen houses ran a main or common drain which was connected with the public sewer in front of such houses by a branch drain, which ran between the houses numbered 73 and 75, at about right angles to the road, under a narrow strip of land, between such two houses, which was unbuilt upon. Each of the sixteen houses connected with the main or common drain by means of branch drains, which conveyed the sewage of each of the houses to the main or common drain and thence through the branch drain into public sewer in front of the houses. The main or common drain and branch drain were constructed wholly upon private property. A nuisance having arisen in the main or common drain and branch drain, a notice was served upon the owners to do the necessary repairs and works to abate such nuisance. The sanitary authority, under S. 41 of the Public Health Act, 1875, entered into and did the work and demanded from the owner of Nos. 51 to 73 his apportioned expenses under S. 19 of the Public Health Acts Amendment Acts, 1890. He did not dispute that the branch drain was a single private drain. It was held that the main or common drain at the rear of the houses Nos. 51 to 73 (odd numbers) was a public sewer, and that the owner was not liable to pay for the repair thereof.*

Here was an extraordinary anomaly. The sewerage running from the houses of the owner of Nos. 51—73 first ran in private drains under the control of the owner, then into a sewer repairable by the local authority, then into a single private drain, and finally into a sewer again! If the decided cases lead to such extraordinary results it is small wonder that property owners and builders are so often plunged into costly litigation.

The most recent case only makes more confusion. We refer to *Wood Green U.D.C. v. Joseph*, 1908, 72, J.P. 393. In that case a row of houses, of which six belonged to the respondent, and the remainder to other owners, were drained by a system of pipes arranged as follows: The houses were drained in pairs; each house of a pair was drained by a separate pipe which discharged into a pipe common to both houses, and each common pipe discharged into a line of pipes laid in private ground behind the houses, which

---

*A diagram showing the exact arrangement of the drains and sewers is to be found in the report *ubi supra*, and helps one to understand the case.

conveyed the drainage to a public sewer. It was admitted by the appellants that the common pipes through which the drainage of the respondent's house passed were sewers within the meaning of the Public Health Act, 1875. It was held by the House of Lords that the respondent's houses were not connected with the public sewer by a single private drain within the meaning of S. 19 of the Public Health Acts Amendment Act, 1890, and that, therefore, the respondent was not liable under that section and S. 41 of the Public Health Act, 1875, to contribute to the expense of repairing the line of pipes behind the houses. The House of Lords held that, on facts stated in the special case, it was not shown that the line of pipes in question was a single private drain.

The whole situation with regard to these vexed questions was accurately summarised by Mr. Justice Channell in the case of *Haedicke v. Friern Barnet U.D.C.*, 1904, 68 J.P. 473, when he said:—

"But it is right to point out that the real difficulty in the way of the Courts doing justice in so many of the cases on this subject arises from the automatic vesting in the local authorities of all sewers, and the automatic imposition of liability for their maintenance and repair by reason merely of the construction and the purpose they serve, and without any assent or acceptance on the part of the local authority. If it were provided that no sewer should be repairable by the local authority until adopted and taken over, as is the case with a new highway, proper provision being, of course, made for requiring local authorities to take over such sewers on notice, and on their being put in proper order, all the difficulties would disappear. The difficulty as to the extent of a surreptitious and wrongful joiner of one drain with another, the difficulty of knowing on whom the liability to repair a particular structure is, would all be got rid of, and, so far as I see, the existing machinery would all work satisfactorily as regards all drains or sewers made after such an amendment of the law. It is a discredit to our legislators or the departments of the executive which have charge of such matters that so simple an amendment of the law should not have been made long ago, as for the last fifteen years or more there has been constant litigation on these points. Of course, if there is to be an amendment of the law, it would be desirable, besides the simple amendment required, to prevent difficulty as to future constructions, to have some declaratory enactment dealing with existing structures, and I presume it is the difficulty of framing satisfactorily such a declaratory enactment which has led to there having been as yet no amendment of the law."

Enough has been said to show that a very short Act of Parliament would be sufficient to put an end to the anomalies which have laid such a burden of litigation on property owners and the rates. A householder who is served with a notice to pay a portion of sewerage expenses does not know where he is, and, as we have seen, the lawyer can do but little to help him out.

The Art Department of the City and Guilds Technical College, Finsbury, under Mr. A. F. Brophy, has for the second time scored a success in sculpture by one of its students, carrying off in the Royal Academy competitions the gold medal and travelling scholarship (in sculpture) of £200. On the first occasion, in 1896, the successful sculptor was Mr. Gilbert Bayes, who had been trained by the late Mr. W. R. Wright in the art classes at Finsbury. Mr. Wright died in 1903, and Mr. Bayes succeeded him as modelling master. The second success, just announced, is that Mr. Alfred Buxton, who, entering in 1900 under Mr. Wright, and continuing under Mr. Bayes, has now, after a connection of nearly nine years with the school, won the prize most coveted by young sculptors in England.

Obituary.

Mr. G. C. Sherrin.

The death is announced of Mr. George Campbell Sherrin, F.R.I.B.A., of The Gate House, Ingatestone, Essex, and 44, Finsbury Square. Mr. Sherrin, in his earlier years exhibited with some success at the Royal Academy, and among his best work was a picture of The Gate House Ingatestone. The originality and beauty of his designs exercised a considerable influence on architecture in Essex, where he began his career. He restored Lord Petre's seat near Brentwood, and reconstructed and built residences in all parts of that county and in Surrey, Sussex, and the Isle of Wight. He also designed the Alexandra Hotel, Dovercourt, and the Southend Kursaal. Among his London works were Rayleigh House, Chelsea, for the Hon. Richard Strutt, and Cannon Street Buildings, offices in Carey Street, Lincoln's Inn, St. Mary-at-Hill House, Eastcheap, and premises in Clarges Street, Piccadilly, and Finsbury. As architect to the Metropolitan Railway Company, Mr. Sherrin rebuilt Moorgate Street Station, Kensington High Street Station, with its arcade and adjoining shops, South Kensington Station, and Gloucester Road, the Monument, and Mark Lane Stations. About sixteen years ago he reconstructed Spitalfields Market. The branch of his work which perhaps afforded him most satisfaction was that connected with religious buildings, especially the dome of the Brompton Oratory, the the new buildings at Douai College in France, and the re-erection in Eldon Street, of the church of St. Mary's Moorfields. It is appropriate, therefore, that in the last-named building there was sung on the day of his funeral a solemn requiem mass. The funeral partly afterwards travelled to Ingatestone, the interment taking place in the neighbouring parish of Frierning. Mr. Sherrin leaves a widow, with three sons, one of whom, Mr. Frank Sherrin, had been associated with him for many years in his practice, and three daughters.

Mr. John Angus.

Mr. John Angus, a well-known Edinburgh builder, has just died at his residence, 6, West End Place, Edinburgh, in his sixty-first year. Mr. Angus, who commenced business over thirty years ago, was a native of Crief. He was a member of the Building Trade Exchange, and had contracted for H.M. Board of Works.

JAPAN-BRITISH EXHIBITION,

A meeting has been held of the "Public Health and Sanitation" Committee, under the Presidency of Mr. H. D. Searles-Wood, F.R.I.B.A. The committee itself is formed as follows:—Mr. H. Adams, M.I.C.E.; Mr. T. W. Aldwinckle, F.R.I.B.A.; Mr. H. P. Boulnois, M.I.C.E.; Professor H. R. Kenwood, M.B.; Colonel J. Lane Motter, R.A.M.C., M.A., M.D.; Dr. Samuel Rideal, F.I.C.; Mr. H. Saxon Snell, F.R.I.B.A.; Mr. W. C. Tyndale, M.I.C.E.; Mr. J. E. Wilcox, M.I.C.E.; Mr. J. E. Wroth, M.I.C.E., of the London County Council; and (ex officio) Sir John Cockburn.

The effect of the meeting is that special efforts are to be made to ensure that the public health and sanitation section, concerning as it does the welfare and comfort of the community, shall be one of the most important at next year's great undertaking, and shall bear a favourable comparison to the great demonstration to be made by our Japanese allies who, in peace and war, have proved themselves to be distinguished sanitarians. A classification for the section was agreed to which embraces schools, prisons, barracks, camps, building material, dairy appliances, apparatus for water supply, heating apparatus, lighting and ventilation, clothing, domestic appliances, means for the development of the physique, and so on. In order to carry out the enormous amount of work which this represents, it was decided to appoint provincial sub-committees for Leeds, Birmingham, Newcastle, Glasgow, Edinburgh, Cardiff, Liverpool, Manchester, Bristol, Bublin, and all the great industrial and mercantile centres. A feature of the section is to be its attractiveness from a spectacular as well as from an educational point of view.

APPOINTMENT OF WEST RIDING EDUCATION ARCHITECT.

The appointment of an architect to carry out the work of the Education Authority for the West Riding has been made. In response to an advertisement, 236 applications for the position were received, and the successful applicant eventually proved to be Mr. J. Stuart, who has been in the employment of the West Riding County Council for the past nine years. A special committee examined the 236 applications, and selected eight of the candidates to be interviewed. These were afterwards reduced to three—Mr. Stuart; Mr. George C. Lowbridge, deputy architect to the Staffordshire Education Committee; and Mr. Arthur L. Roberts, of Winchester, chief architectural assistant to the Hampshire County Education Committee. These three attended before the Finance Committee of the County Council, who had been empowered to make the appointment, and their choice fell upon Mr. Stuart, who has had a great deal of experience in school architecture.

Societies' Reports.

Sheffield Society of Architects.

The valuable work which is being carried on by the National Trust for Places of Historic Interest or Natural Beauty was described before the members of the Sheffield Society of Architects and Surveyors at the Sheffield University, by Mr. Nigel Bond, M.A., secretary of the Trust. Mr. Bond explained that the Trust stood for the preservation of the beautiful and the historic. This country possessed a great mass of beautiful landscapes and beautiful architecture, but in diminishing quantity, and it was felt that in the interests of the nation and of national interests that as much as possible should be done, without interfering unduly with other interests, to preserve the beauty of that architecture. The Trust also stood for other interests besides the æsthetic and the architectural. There were existing many good examples of that continuity which is one of its main features, showing how one event glided, so to speak, into another, and went forward without any great breaks.

Bristol Society of Architects.

At a sessional meeting of the Bristol Society of Architects, held at the Fine Arts Academy, Clifton, a lecture was given by Mr. G. Salway Nicol, A.R.I.B.A. (Tite prizeman, 1907), on "Rome and Paris; Their Architectural Relations." The lecture was illustrated with lantern slides, and numerous photographs and sketches made by Mr. Nicol. In the unavoidable absence of the president (Mr. Green), Mr. Frank Wills presided. Mr. Nicol explained that he had spent many months in the cities of Rome and Paris sketching their streets and he brought some of his sketches with him, because without illustrations it was impossible to describe architecture adequately. He proceeded to allude to the influence of the architecture of Rome and Paris upon the whole of the Western World and the effect of the architectural tradition which was handed down from ancient Rome. He urged the importance of students studying that tradition in all its phases, both as regards design and historical development. He showed that France had availed herself freely of the teaching of Roman architecture, and pointed to the definite personal expression in the buildings of the Renaissance architects, From the buildings of Paris, he showed, much could be gathered of the character and aspirations of the French people.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Dec. 31.	SOUTHEND-ON-SEA. NEW COUNCIL SCHOOL. Limited to Architects practising in the Borough. Conditions of competition and plan of site on application to J. W. Barrow, Clerk to the Education Committee, Education Offices, Municipal Buildings, Southend-on-Sea.
1910. Jan. 1.	LARNE. TECHNICAL SCHOOL IN VICTORIA STREET. For the Larne Technical Instruction Committee. Total cost, including fixtures and enclosing of ground, not to exceed £3,600, Premium, £21, merged. Successful competitor will receive commission of 5 per cent. for supervision, including plans, specifications, estimates, and *Bills of Quantities*. Particulars of Thomas Clearkkin, Secretary, Technical In-Instruction Committee, Larne.
Jan. 1— Mar. 1.	NEW BUSINESS PREMISES, LEEDS.—The Directors of the Leeds Industrial Co-operative Society (Ltd.) invite competitive drawings and estimates for new Business Premises and Offices, to be erected on the site of the old "Mercury" Office, Albion Street, Leeds. Premiums of £100, £50, and £25, respectively are offered, and will be awarded to the authors of the designs and plans placed first, second, and third by the Assessor. Conditions of competition, and lithographed plans and other particulars, will be forwarded on application to the Secretary, on or before Jan. 1, 1910, on receipt of stamped addressed foolscap envelope, accompanied with a deposit of £2 2s. Competitive designs and plans to be sent in to the Secretary, John W. Fawcett, Leeds Industrial Co-operative Society (Ltd.), 10, Albion Street, Leeds, not later than March 1, 1910. To the architect deciding not to compete, and returning all documents within seven days, the deposit will be returned.
Jan. 15.	ELEMENTARY SCHOOL, KEIGHLEY.—The Education Committee invite competitive designs and estimates for a new Public Elementary School for older children to be erected at Highfield, Keighley. Printed instructions and conditions, with a lithographed plan of the site, may be obtained on application at the Education Offices. Designs and estimates to be sent by Jan. 15 to H. Midgley, Secretary, Education Offices, Keighley. Only architects residing or carrying on business within the Borough are invited to compete.
Jan. 31.	NATIONAL MUSEUM OF WALES. The Council desires to receive competitive designs for the erection of a new National Museum at Cardiff, Three premiums are offered of £200, £150, and £100, for second, third, and fourth. The Council have appointed Sir Aston Webb, R.A., Mr. John J. Burnet A.R.S.A., and Mr. Edwin T. Hall, F.R.I.B.A., as Assessors. Particulars and plans of the site will be supplied to competitors on payment of a fee of £2 2s., returnable if all papers are returned within 14 days. Inquiries to be addressed to Dr. Wm. Evans, Hoyle, Director of the Museums. City Hall, Cardiff.
Feb. 1.	OLDHAM, EXTENSION OF THE TOWN HALL. Restricted to Architects practising or residing in the Borough. Premiums of £50, £30 and £20, for the three designs placed 1st, 2nd and 3rd, and a sum of £5 will be paid to all unsuccessful competitors who send in a complete set of plans in accordance with the instructions. Plan of site, with instructions and suggestions for architects obtainable from E. C. Foote, Borough Surveyor, Town Hall, Oldham. Deposit: 21s.
Mar. 1.	GLAZED BRICKWORK DESIGNS AND ESSAYS. A committee of glazed brick manufacturers invite designs for works to be executed in glazed brickwork, also essays as to the advantages to be derived from the use of this material in accordance with conditions to be obtained from J. Johnston Green, 142, Liverpool Road South, Southport. Premiums of 100 guineas, 50 guineas and 25 guineas awarded to designs and essays jointly. Assessor Mr. Max Clarke, F.R.I.B.A., appointed by the President, R.I.B.A.
May 31.	MUNICIPAL OFFICES, KARACHI. The Municipality offer a premium of 7,500 rupees (£500) for the best design, detailed plans and estimates for new Municipal Offices. Cost not to exceed 500,000 rupees, and the style of architecture is left open to the designers. Ferrotype plans of the site and a general arrangement of the floors of the building showing the accommodation to be provided together with a copy of instructions to architects, will be supplied to intending competitors on application to the Chief Officer and Chief Engineer, Karachi Municipality. A charge of Rs. 5 will be made therefor, which will not be refunded. Each set of drawings must be sent in anonymously, but accompanied by a sealed envelope containing the author's name and address. Each set of drawings and all the documents required, including the sealed envelope, must be securely packed in a wooden box addressed as follows:—The Chief Officer and Chief Engineer, Karachi Municipality, Karachi, India, and forwarded, at the competitor's own risk and charges, in time to reach the Chief Officer on or before the 31st day of May, 1910. It is proposed to apply to Government for permission for one of the chief architects to act as assessor to decide on the design to which the prize shall be awarded. The decision of the assessor will be final and not be open to dispute. The decision of the Municipality will be made within three months of the latest date for submission of designs, and payment of one-half of the premium will be made thereafter to the author of the selected design, the balance to be paid when the further details specified in the instructions to architects have been supplied. On payment of the premium the Municipality will have all rights in the design, with power to erect the building under its own agency, either according to the design selected or with such additions or alterations as it may deem necessary.

Our Plate.

London Homœopathic Hospital.

The new wing named after Sir Henry Tyler has a frontage of 86ft. 6in. to Queen Square, and 41ft. to Gt. Ormond Street, and is seven storeys in height. The new wing contains extension of out-patients' department, new Board Room, and offices, three large wards with day and other rooms, ten private wards, and several isolation wards, etc., etc., with a second staircase at the north end.

In addition to the new wing, extensive alterations are to be made in the interior of the old part to bring it up to the present-day requirements—replanning and extending the out-patients department with new consulting rooms, theatres, etc., forming new small wards, increasing kitchen, operating theatres, etc., new boiler-house and fitters' shops, and remodelling part of the old Staff Home.

The architectural style of the new building is English Renaissance, and the external facing is of Portland stone.

The balconies on the western or Queen Square front will form a useful adjunct to the wards, enabling patients to sit in the open air in the enjoyment of a good prospect and sheltered from flanking winds.

The architect is Mr. Edwin T. Hall, F.R.I.B.A., of 54, Bedford Square, W.C. The contractors are Messrs. Holliday and Greenwood, Ltd., of Brixton, S.W., and Mr. A. Turner is the clerk of works.

The Local Government Board have agreed to make a grant of £1,000 towards the reclamation of the banks of the Wandle in the Earlsfield portion of the Wandsworth borough. When the scheme is completed the banks of the Wandle will have been converted into a picturesque boulevard. It is proposed to reclaim the banks, lay out grass walks, plant trees, and generally transform the unsightly Wandle banks into a pleasant riverside walk.

WINDOW CILLS IN BRICK BUILDINGS.

By Edwin Gunn, A.R.I.B.A.

Window cills of some sort are a necessity in buildings of every class. Small houses and other structures on a minor scale are often made or marred by petty details which in larger buildings would be relatively unimportant, and of such details the cills are not the least frequent offenders. The building construction text books, which know only stone weathered, throated, and projecting cills are probably the cause why, in the large proportion of cases, this form of cill is instinctively and often unnecessarily adopted. Many quiet brick buildings are seriously damaged in scale by clumsy stone cills.

At the start it will be well to examine the reasons why a cill must be provided to each window opening. It is not sufficient to say merely that it is to throw off the wet which would lodge on the ledge at the bottom of the window reveal, and to prevent its soaking into the wall. Some designers, recognising this portion of a cill's functions, have rashly thought that by building all frames flush, thus abolishing the reveal and consequently the ledge, all need for a cill or its equivalent would be avoided. The reason actually goes deeper. Wall surfaces of all kinds are porous to a sufficient extent to take up the casual rainspots which ordinarily fall upon them. Glass, however, being non-absorbent, allows moisture to stream down; and it is this *collected* water which would

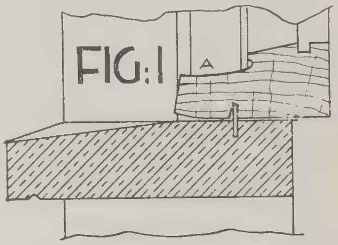

FIG:1

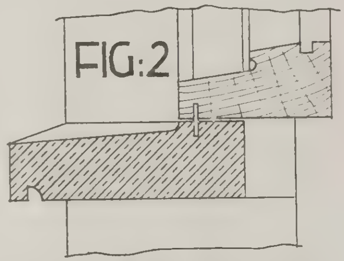

FIG:2

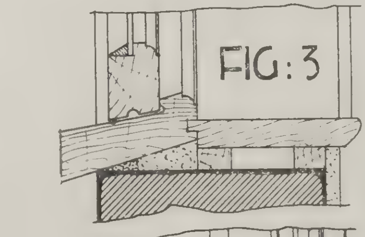

FIG:3

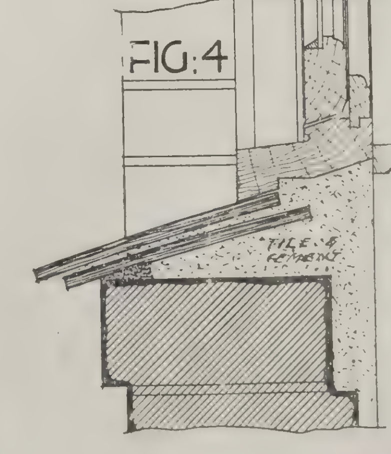

FIG:4

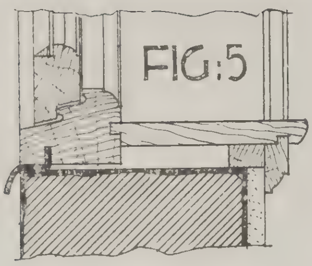

FIG: 5

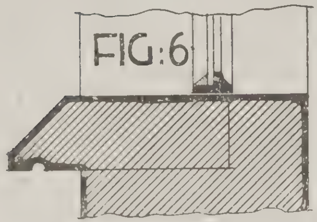

FIG: 6

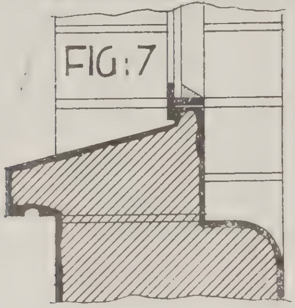

FIG: 7

tend to soak into the brickwork at the window ledge (if not protected by a cill); or where the ledge is abolished as previously mentioned, would saturate the brickwork below the window, producing in time a stained and streaky effect the reverse of lovely. In all but glazed brick facings, a projecting drip at the cill is desirable.

Stone Cills.

Where stone cills are adopted there are points to which it is well to give attention. The cill, as produced by the mason, is often like Fig. 1, the so-called throating being a shallow V-shaped scratch, and the sinking absent altogether. A more effective throating is that shown in Fig. 2, a form which secures that it shall fulfil its purpose of a drip. The groove for metal tongue is frequently worked too far back from the front edge of the cill, exposing an unnecessarily large portion of the wood cill resulting in the possibility that it may curl up and allow water to lodge thereon, thus inviting decay. As the object of the metal tongue is to exclude water, it is obvious that the less far it is allowed to penetrate, the better. In sashes with cased frames, the best position is immediately behind the outside lining, which, where carried down in front of the oak cill at the ends, forms there one side of the groove.

Wood Cills.

In cottage work where economy is of vital importance, a practicable form of treatment with flush frames is to extend the oak cill about 1½in. in front of the brickwork, working it on the slant as shown in Fig. 3. The feather-edge forms an effective drip, and if the cill is bedded on a cement fillet in front, and well grouted up with cement from behind after fixing, it makes a watertight job. The frame requires well fixing to the jambs, as the cill is practically free. Where projecting wood cills are objected to, the treatment shown in Fig. 5 is a simple one. A narrow strip of 6lb. lead is wedged into a groove previous to fixing the frame, and turned down over the brickwork, but not beaten close. Sometimes instead of fixing in a groove in the cill, the strip is made wider and copper-nailed to the back edge, extending right through the joint.

Tile Cills.

Where the frames are necessarily fixed in reveals, a variant of the cill shown in Fig. 3 may be arranged, with a weathered cill of two courses of tiles breaking joint, as shown in Fig. 4. This cill it is better not to form until the brickwork is completed (when it may be quite easily done, space, of course, being left), as otherwise the projecting tiles are likely to get displaced or damaged by rough usage before the cement sets hard. The check shown on the underside of the wood cill is desirable in exposed positions to prevent water which runs over the tile weathering from being blown through the joint between wood and cement, which of course have no adhesion. If the cement is well filled in solid it forms an efficient check.

Blue Staffordshire Cills.

Figs. 6 and 7 show two forms of blue brick cills commonly adopted in factory work, Fig. 6 being an inferior method in which a common offset brick is made use of, and Fig. 7 a more suitable one properly sunk and weathered and combining well with T section steel sashes.

Proposed New Works.

ARDROSSAN.—The Parish Council have agreed to the borrowing of £5,000 for the renovation of the County Council Poorhouse.

BARNES.—The U.D. Council have approved plans for the following:—Additions at the "Jolly Gardeners," Lower Richmond Road, Mr. W. J. Parker; plan of two shops, Sheen Lane, Mr. A. Stanley; five houses, Sheen Lane, Mr. C. Barwell; winter garden at the "Hare and Hounds," Upper Richmond Road, Mr. R. B. Rowell; four houses, Christ Church Road, Mr. C. Barwell; additions to club premises, Alder Road, Messrs. J. Harrison and Co.; seven shops, Upper Richmond Road, Mr. G. Hunt; additions to laundry premises, rear of 28b, Sheen Lane, Mr. E. Seaber; cottage, Railway Side, Mr. H. E. Retham; and eleven houses, Clavering Avenue, Barnes, Mr. T. W. Brenton.

BATH.—The L.G. Board has held an inquiry into the application of the Corporation to borrow £2,335 for alterations and additions to the Technical Schools. Mr. Mowbray A. Green is the architect.

BOURNEMOUTH.—The L.G. Board has opened an inquiry into the application of the Corporation to borrow £77,000 for the erection of a pavilion overlooking the pier approach. The proposed building includes a pavilion, large and small halls, a lounge, smoking, reading and billiard rooms, restaurant, dining room, etc., and public refreshment rooms. There is considerable opposition to the scheme, and the inquiry was adjourned sine die, the inspector, Mr. H. Shelford Bidwell, intimating that he could not attend before the third week in January.

CLYDEBANK.—The Town Council is considering the erection of a public library towards the erection of which Mr. Carnegie has offered £10,000.

GLASGOW.—The Dean of Guild Court have granted linings for the following buildings:—Walter MacDonald Bergius, engineer, engine works and offices in Dobbie's Loan; Glasgow Corporation, two pavilions at Ruchill Hospital; St. Peter's Episcopal Church, a temporary hall at the church in Gardner Street; the Progress Steel and Foundry Company, fitting shop on ground adjoining Avenue Street.

ILFORD.—The U.D. Council has passed plans for the following:—E. Silcock, house, 37, Pelham Road; W. Fletcher, Ltd., workshop in Roden Street; W. Brothers, stables rear of 174, Richmond Road; F. George, alterations to Ilford Paper Mills; W. Hancock, for Biograph Theatres, Ltd., Cinematograph Theatre, 63, High Road; E. T. Dunn, for A. Stearn and Son, shop premises, Cranbrook Road; H. E. Richards, new front to Skating Rink, High Road.

LARGS.—The Town Council has determined to build a sea wall along the Broomfields from Gogo Bridge. It has also been decided to lay a concrete footpath along the lower terrace walk of the Broomfields.

PRESTWICK.—The L.G. Board has held an inquiry into the application of the Board of Guardians for a loan of £6,000 for additional works incurred in the erection of the Booth Hall Infirmary.

RAWTENSTALL.—The Town Council has approved plans for the following:—Shops and offices, etc., Bank Street, Rawtenstall, for the trustees of Longholme Wesleyan School; bridge over Westwood Street, Reedsholme, for Messrs. Coates Bros.; four dwelling houses at Thistle Mount Avenue, Newchurch, for Mr. James Pinnington; new street at Thistle Mount Avenue, Newchurch, for Dr. Holt; plan of dwelling house, Hamer Street, Rawtenstall, for Mr. Wm. Fielding.

SLATEFORD.—The residents are raising funds for the erection of a public hall. Sir Oliver Riddell has given £100 to the fund on behalf of his wife and himself.

STOURBRIDGE AND HALESOWEN.—The Joint Hospital Committee have had plans prepared by Mr. Folkes for an extension of the Hospital at an estimated cost of £2,000.

UPTON, CHESHIRE.—The L.G. Board has held an inquiry at Chester into the application of the Cheshire County Council to borrow £82,000 for the extension of the Upton Pauper Lunatic Asylum.

WORKS IN PROGRESS AND COMPLETED.

ABERCARN.—The foundation stones of a new school in connection with Garn Congregational Church, Abercarn, have just been laid. The building when completed and furnished is estimated to cost £2,000.

BARROW.—The new laundry, which has been erected at the workhouse at a cost of £2,500, has just been opened. Mr. Fowler is the architect, and Messrs. Tullis, Neal, Bell, Walker, and Slee are the contractors for the various works.

BELLSHILL.—A new Baptist Church is now in course of erection from the design of Messrs. Miller and Black, F.R.I.B.A., I.A., Architects, of Glasgow. The church, which will provide accommodation for 550 people, is estimated to cost £2,000.

CHISWICK.—The new church of St. Michael's, Sutton Court, Chiswick, which was recently consecrated, was designed by Messrs. Caröe and Passmore, is late Gothic in style, and has accommodation for about six hundred worshippers.

COTTINGHAM.—The foundation stones of the new Council buildings, which are estimated to involve a sum of £2,260, have just been laid.

DUNDEE.—The Dundee Royal Infirmary will shortly be equipped with a new building for the treatment of out-patients. The building is estimated to cost £3,800, and will occupy the piece of ground on the west side of the Infirmary, an area of about 6,000 square feet. The architect is Mr. James Findlay, 33, Albert Square, Dundee.

EARBY, NEAR COLNE.—The new church, which was recently opened here by the Bishop of Ripon, has cost, it is estimated, about £8,000.

GLASGOW.—The new wing of the Glasgow School of Art, which has just been opened, has a frontage of 246ft. in length and 93ft. in height. It stands on a hill in the west centre of the town, and its back elevation is nearly a third more than the height of the front. The building is the work of Mr. Mackintosh, the Scottish architect, whose art has aroused much enthusiasm in Germany. Among the old students of the school are Sir James Guthrie, Mr. John Lavery, Mr. E. A. Hornel, Mr. A. Roche, Mr. George Henry, Mr. Francis Dodd, Mr. Muirhead Bone, and Mr. D. Y. Cameron.

HYDE.—The Cheshire Education Committee have let a contract for the erection of a new county school at Hyde for the sum of £12,345.

LEVEN.—The Parkhill Public School, Leven, which has been erected at a cost of about £8,000, was recently opened. The new school, a two-storey building, which will accommodate 480 pupils, consists of assembly hall, eight classrooms for 60 pupils each, four teachers' rooms, cloakrooms, lavatories, caretaker's closets, heating chamber, etc. The

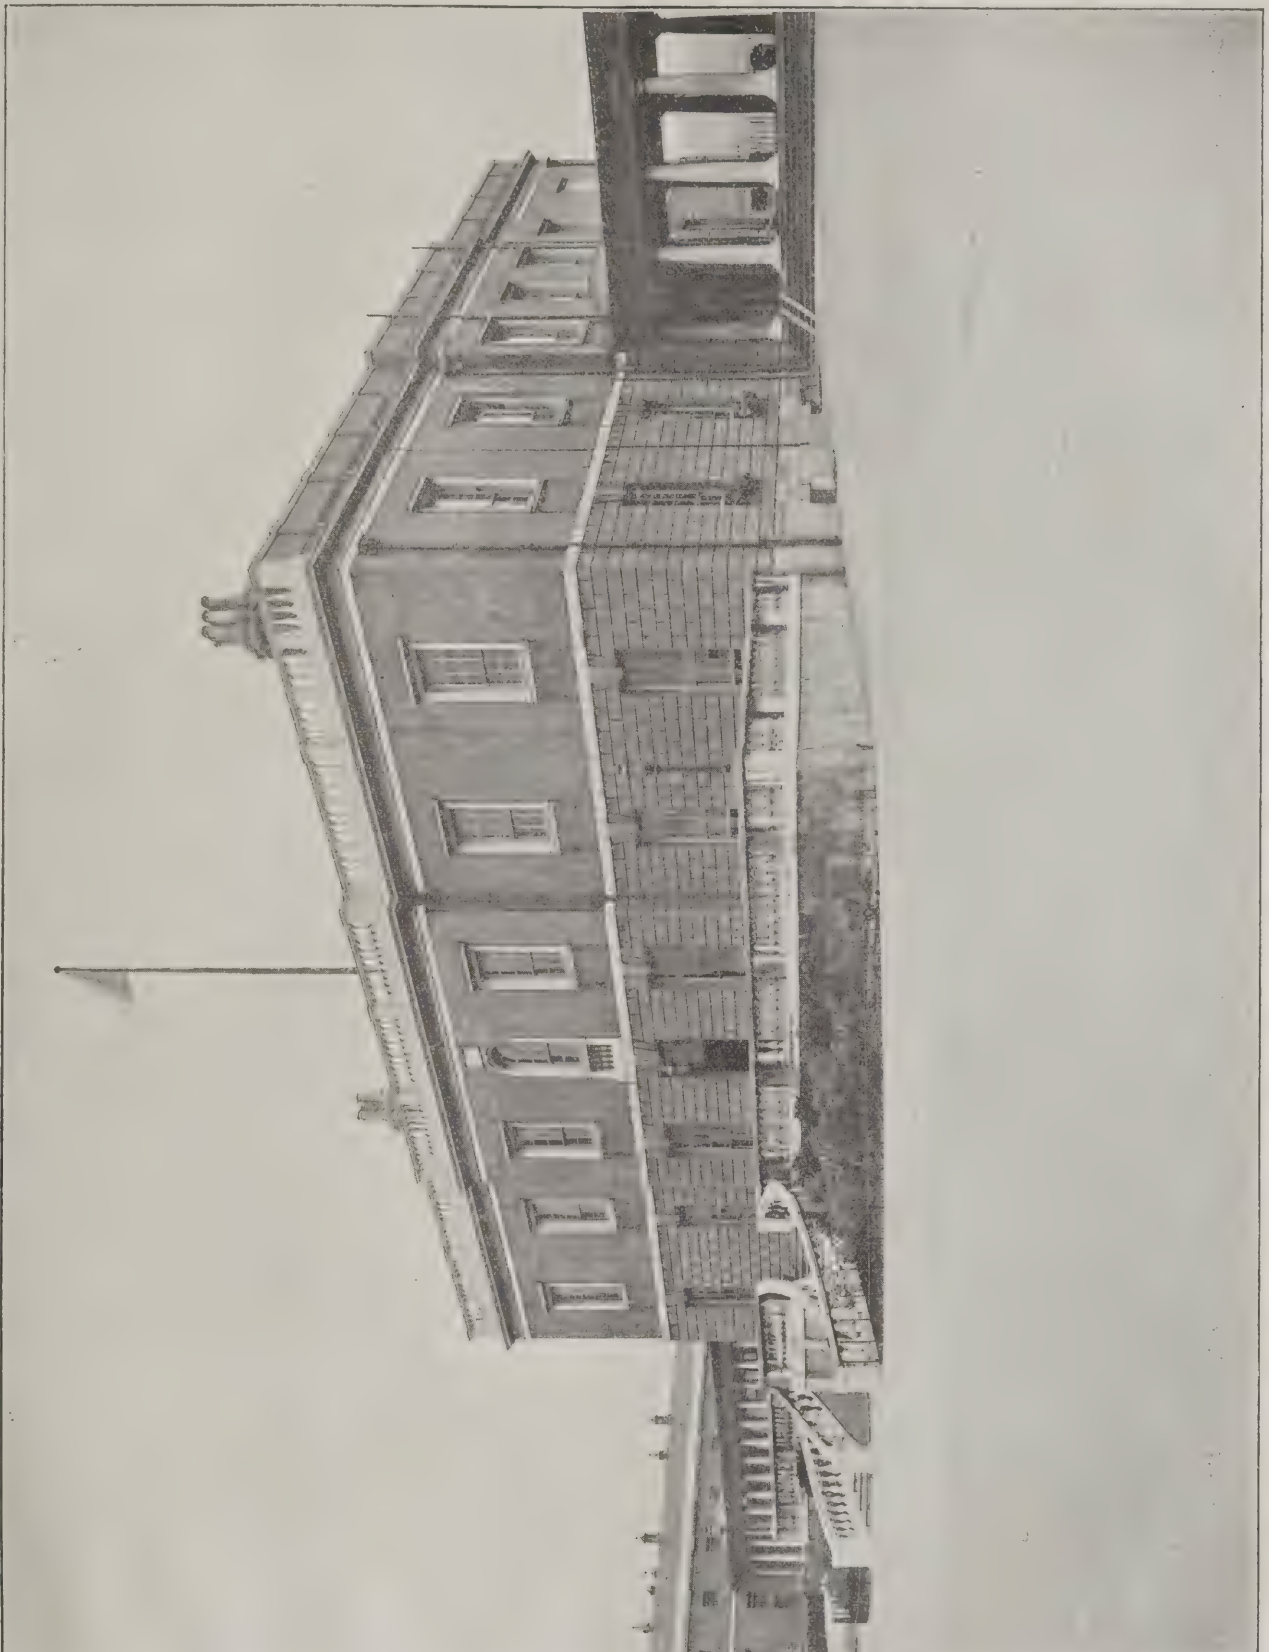

Photo: E. Dockree.

THE QUEEN'S HOUSE, GREENWICH. INIGO JONES, ARCHITECT.

building is almost wholly of brick, there being only freestone dressing at the staircases and a stone cornice at the wall-head. The architects were Messrs. Haxton and Walker, Leven, and the clerk of works Mr. James Wilkie, Leven. The principal contractors were:—Masons, Messrs. James Kinnear, Sons, and Co., Edinburgh; joiner, Mr. Alex. Waddell, Burntisland; plumber, Mr. Alex. Stewart, Cupar; plasterers, Messrs. W. and J. Easton, Kirkcaldy; slaters, Messrs. Chas. Neave and Sons, Leven; painters, Messrs. J. and J. Brown, Leith.

LONDON.—Considerable progress has been made with the new embankment wall at the river side at Westminster, in connection with the building of the new hall for the London County Council. The contractors have already commenced operations, the tidal waters having been shut out by a cofferdam, which runs along the whole frontage. A layer of concrete five or six feet thick will be placed on the clay bed throughout the whole area to be covered by the building. The embankment wall is being erected in Welsh granite, of which about three thousand tons will be used.

LONDON, N.E.—We are informed that Messrs. E. A. Roome and Co., of 36, Basinghall Street, E.C., and Urswick Road, Homerton, N.E., have secured the contract for the completion of St. John the Baptist Church, Holland Road, Kensington, under the supervision of Messrs. James Brooks, Son, and Adkins.

LONDON, S.W.—The new Trevelyan Hall, Westminster, which was recently dedicated by the Bishop of Kensington, stands in St. Ann's Lane, Great Peter Street. It adjoins, and is an extension of, the mission buildings of St. Matthews. On the first floor, approached by a separate entrance, is the Trevelyan Hall, having an area of some 1,560 super feet. An important painting by E. de Morgan, entitled "Attainment," is the chief ornament of the interior. The building is warmed by hot water radiators, and lighted by electricity, a secondary system of gas lighting being provided. There are two emergency exits and staircases as well as the main staircase. The frontage to St. Ann's Lane is largely of terra cotta and partly of glazed brick. The work has been carried out from the designs of Mr. Harold S. Rogers, architect, of 7, Dean's Yard, by Messrs. F. C. Hoskins and Co., of 4, Tufton Street, S.W. The following are some of the contractors with their respective works:—J. C. Christie, Aldgate, warming and lighting; Mark Fawcett and Co., Greenwich, fireproof flooring and steel roof principals; Samuel Haskins and Co., Old Street, E., revolving partition; Wm. Pearce, Ltd., Birmingham, iron casements and glazing; Shaw's Glazed Brick Co., Whitekirk, Darwen, facing bricks and terra cotta; Winser and Co., Buckingham Palace Road, drainage and sanitary fittings.

RICHMOND, YORKS.—The brass tablet which has been inserted in the wall of the Parish Church in memory of the late Lord John Lawrence was recently unveiled. The tablet was the work of Mr. John Phipps, of London.

SABDEN.—The new Baptist Church and schools, which are now in course of erection, have been designed by Mr. F. J. Parkinson, of Blackburn, and are estimated to cost £4,800. The church is planned to seat about 400 people. Both buildings are faced with local rubble (tuck pointed), with Whalley stone dressings.

SACRISTON.—A new workmen's club and institute, built at a cost of £3,400, has just been opened here. The building is constructed of brick, the front being faced with Accrington red-pressed facing bricks. The stone dressings were from the Blaydon quarries. Mr. G. T. Wilson, Blackhill, is the architect.

USHAW MOOR.—Foundation stones of a new group of cottage homes have just been laid. The group consists of twenty cottages, and the cost of erection is estimated at £2,500. The site affords a pleasant view of the Dearness Valley, and the cottages will face direct south. Each house will be self-contained, and will consist of a kitchen, bedroom, scullery, and pantry. Mr. C. Johnstone, of Bishop Auckland, is the architect, whose services have been given gratuitously; and Mr. Herbert Baines, of the same town, is the builder.

WORKSOP.—A new roller skating rink, which is now in course of erection, will cost approximately £2,000. The skating area is nearly 7,000ft., the total area covered being about 9,000ft. The architect is Mr. F. Hopkinson, Worksop, and the contractors Messrs. G. Henderson and Sons, Newark, in conjunction with Messrs. Davis Bros., of Wolverhampton.

LIVERPOOL PAINTERS' DISPUTE SETTLED.

Mr. Bertram B. Moss, secretary of the Liverpool Master Builders' Association, reports the settlement of the dispute with the painters. In August, 1907, a five years' agreement was signed by the operative painters, and everything ran smoothly until February this year, when the painters belonging to shops of two of the members of this association struck work owing to these firms taking men on at the various jobs without paying expenses and walking time. Negotiations took place with the operatives, but they refused to submit the matter under the rules to a Conciliation Board, with the ultimate result that the Liverpool Master Builders' Association wrote to the operatives saying that as they refused to abide by the rules, the agreement was at an end, and for some months the operatives went on working without any agreement between the two bodies. Early in November the employers decided, as there was no agreement, to reduce the men's wages ½d. per hour, with the result that this brought the operative societies into communication with the association again, and on December 1st an agreement was signed bringing in the previous five years' agreement, and agreeing to submit the matter in dispute to the decision of an independent arbitrator. A clause in the agreement also stated that after the decision was given, neither side should have any by-law or rule in any way counteracting the rules in existence between the employers and operatives.

The arbitration has taken place, and the arbitrator, Mr. H. Neville Bewley, solicitor (Messrs. Payne, Frodsham and Bewley, 9, Harrington Street, Liverpool), has given his award as follows:—

"The words to be interpreted were: 'This rule applies only to men sent from the shop and not to men engaged and paid at the job.'

"1. That any interpretation of the words above mentioned (so far as I was requested by the parties at the said reference to interpret the same), is that the said words authorise the members of the Liverpool Master Builders' Association to engage and pay men at the job, and that such men are not entitled to the benefit of the walking time allowance and payment of fares mentioned or referred to in the earlier part of the said rule.

"2. And that the said Liverpool Operative House Painters' Old Society, and National Amalgamated Society of Operative House and Ship Painters and Decorators (Liverpool District Committee) shall bear and pay eleven pounds, five shillings, the costs of this my award."

It will be seen from the above that the employers' contention was right, and employers are now, without any trouble, allowed to take men on at the various jobs, without having to pay expenses and walking time.

In order that employers will not discharge a man at the shop and send him to a job, with a view to saving walking time and expenses, the following rules have been agreed upon between the employers and operatives, for the guidance of members:—

"1. An employer can place a board outside his office or yard stating that painters are wanted at such and such a job. Application only at the job.

"2. In the event of a board not being used, if a painter applies at the office for work, the employer can say: 'We want painters at such and such a job, if you like to apply.' Also make it clear that no expenses will be allowed.

"3. In the event of a painter being discharged at the shop, and there is no board in use as suggested above, nothing to be said to such painter about having work at a job outside if he likes to apply."

Notes and News.

The London County Council have adopted the report of the Highways Committee, who stated that it had been necessary, in accordance with the request of the Port of London Authority, to remove certain old pile stumps at Waterloo Bridge which were considered dangerous to navigation. As the piles formed part of the foundation of Waterloo Bridge, very great care was needed in dealing with them, to ensure that the stability of the structure was not affected. The whole of the work had, of course, to be done by divers. Some further piles have been found to exist under the bridge in the centre of the most northerly arch, and the committee promise to report, if necessary, at a later date, as to the action which it may be desirable to take in the matter.

* * *

There has just been opened a great boulevard joining the three industrial cities of the Departement du Nord, which with the system of electric tramways in connection with it constitutes a most remarkable work, on account both of its extent and of the rapidity with which it has been carried out. The boulevard was constructed in three years. It has a length of 14.5km., and includes two branches, one starting from Roubaix, 4.036km. long, and the other from Tourcoing, 6.7km. long. The two branches unite in a common thoroughfare, 2.5km. long, which ends in the centre of Lille. The boulevard is 50 metres wide. On each side, bordered by footways 3.5 metres wide, is provided a roadway 5.5 metres wide, reserved for heavy traffic. A central roadway of 9 metres is allocated to light vehicles and motor-cars. Between it and the other roadways there are two raised roads 11.5 metres, wide, for foot passengers, cyclists, horse-riders, and a tramway.

* * *

A viaduct has recently been constructed of reinforced concrete to carry the Linda Vista Avenue across the valley of the Arroyo Seco, in Pasadena, California. The viaduct, which is 400ft. in length, with a 20ft. roadway and two 4ft. sidewalks, is about 50ft. above the bed of the river, and consists of six girder spans resting on five towers. Each tower is composed of four concrete columns 18ins. square and over 50ft. in height, each column being reinforced with eight 1¼in. round steel bars extending down to the piers. The towers are constructed with longitudinal and transverse struts, varying in size from 10ins. by 18ins. to 12ins. by 24ins., reinforced with four ⅞in. twisted steel bars. The deck consists of a reinforced concrete slab, longitudinal stringers, transverse deck beams, and girders. The stringers are 17ft. 3ins. long and 6ft. on centres, with a cross section of 7ins. by 19½ins., reinforced with four 1in. twisted steel bars. The deck beams between the large girders have a cross section of 10ins. by 25ins., and are reinforced with six 1⅛in. twisted steel bars. In the tower spans these transverse beams were increased to 12ins. by 30ins. to add lateral stiffness. The large girders, 51ft. 9ins. long, extending from tower to tower, have a cross section of 16ins. by 58½ins., and are reinforced with nine 1⅜in. twisted steel bars in tension and three 1⅜in.

round steel bars in compression. The bridge was designed to carry a 20-ton roller, but the heaviest one that was available weighed 14 tons. In the tests which were made with this roller, the greatest deflection that occurred in any girder amounted to 1-1,200 of the span. The engineers were Messrs. Mayberry and Parker, of Los Angeles.

* * *

The erection of the new south transept of Selby Abbey is to be entrusted to Mr. Thomas S. Ullathorne, of Selby, who carried out the recent restoration. It is hoped that by the time this portion of the work is completed funds will be forthcoming to erect the superstructure, which will be open to tender.

* * *

The subject given in 1909 for the Essay in competition for the Henry Saxon Snell Prize was "The Principles of Heating and Ventilating Public Buildings, with descriptive details and illustrations of the best systems." It is officially announced that fifteen essays were sent in, and they have been brought under the consideration of the Council. Acting upon the advice of the adjudicators appointed, the Council have awarded the prize offered of £50 and a bronze medal of the Institute, to Mr. Alfred E. Wheeler, West Ealing, writing under the motto "Hellios." Two of the other essays showed exceptional merit, and the Council have therefore decided to increase the amount of the award by £20, and to divide this amount equally between the writers of these two essays—to Mr. J. Roger Preston, M.R.San.I., Stourbridge, writing under the motto "Glow-worm," £10; and to Mr. E. Thomas Swinson, M.R.San.I., Feltham, writing under the motto "Dum Spiro Spero," £10.

* * *

Lord Ashton opened on Monday last the new Town Hall at Lancaster, which, fully equipped and furnished, is a gift from him to his native town. The building has cost £145,000, and additional expenditure upon a statute of Queen Victoria in front of the hall has also been borne by Lord Ashton. The structure is of English Renaissance design, and contains 115 rooms. The public hall will accommodate nearly 2,000 people, and contains an organ. The height of the building to the top of the tower is 146ft. In the tower is a four-dial clock, the bells of which bear an inscription recording Lord Ashton's generosity. Accommodation is provided for all departments of the corporation beneath one roof. Since the death of the architect, Mr. E. W. Mountford, F.R.I.B.A., the work of supervision has been in the hands of his partner, Mr. F. Dare Clapham, F.R.I.B.A.

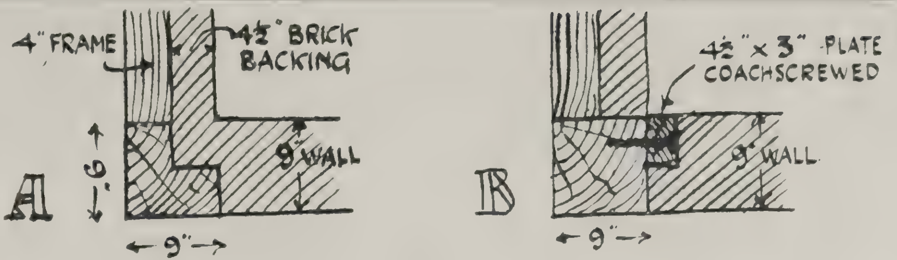
* * *

The Rev. R. C. Bates, Rector of Churchill, near Worcester, is appealing for a sum of £300 to enable him to re-open the nave of his church. On his appointment, six years ago, the building was in a dangerous condition, and money was collected to restore the walls and roof. The sum now asked for is to enable the nave to be fitted for worship. In the churchyard is a gravestone recording the burial of "English nuns of the Order of Poor Clares, who, when banished from Dunkirk by the fury of the French Revolution found a refuge in Churchill," an asylum having been given to them by the then squire, Mr. Berkeley, a member of an old Roman Catholic family. The parish is on the high road from Stratford-on-Avon to Worcester, and Shakespeare must have ridden through it when he went to the Cathedral city before his marriage to make the affidavit which is to be seen by visitors at the Edgar Tower. The church is Fourteenth Century, and a Saxon church preceded it..

GUILD OF ARCHITECTS' ASSISTANTS.

The S. Wales branch of the above guild held the first of a series of meetings in Cardiff, on Friday evening, December 17th. The Cardiff, S. Wales, and Monmouthshire Society of Architects kindly lent their room for the purpose.

A paper was read by Mr. S. Bowen Williams on "Llandaff Cathedral," and was followed by a very interesting discussion. Votes of thanks to the speaker, and the society for the use of the room, were then passed.



ILLUSTRATING REPLY TO "SHREWSBURY—H."

The meeting was well attended, and augurs well for the success of the movement in S. Wales.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor will, however, avail himsel. of the assistance of a large staff of experts in the matters above mentioned, but enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies, or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s. made payable to Technical Journals, Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable: and it must be understood that both question and reply will, as a rule, be published in these columns

Value of Book.

Long Eaton.—L. E. writes:—"I have a book entitled Rural Architecture in the Chinese Taste,' being designs entirely new, for the decoration of gardens, parks, forests, inside of houses, etc., on sixty copper plates, with full instructions for workmen, also a near estimate of the charge and hints where proper to be erected; the whole invented and drawn by William and Tho. Halfpenny, architects. Divided into four parts. The 2d. Edition, 1752. Printed for and sold by Robert Sayer, map and printseller at the Golden Buck, opposite Fetter Lane, Fleet Street. Is this of any value?"

—Halfpenny's "Rural Architecture in the Chinese Taste" has not very much value, say, from 10s. to 15s.

Fireproofing Floor.

Skipton-in-Craven.—"Yorkshire" writes:—"(1) What is the best means of making a present floor of 9in. by 2in. wood joists 12in. apart (floor boards already taken off) fireproof? My idea was to put pugging boards or expanded metal half-way down the joists and fill up to level of floor with 5¾in. coke breeze concrete. (2) To make a present ceiling fireproof: would the best means be to fix ferro-concrete 1½in. slabs to underside of joists and skim with plaster?"

—Coke breeze concrete put as pugging between the fir joists would be very heavy and only be partially effective in producing a fire-resisting floor. A better method would be to strip the present ceiling and fix expanded metal lathing covered with fire-proof plaster. Henry Adams.

Half-timbered Construction.

Shrewsbury.—H. writes:—"The enclosed sketch (not reproduced) shows a half-timbered gable end with the 9in. × 9in. corner post butting against a 9in. brick wall, which is not timbered, thus leaving a straight bull joint between the post and wood through to the inside for a length of 15ft. As the work settles, this joint is certain to open and develop a crack through to the inside of the house. Kindly suggest a sound method of bonding the wood post and wall together. The 9in. × 9in. square post must be adhered to. Hoop iron has been considered, also a 4½in. brick casing round post inside, but neither is favourably received."

—The construction is bad, and if the 9in. × 9in. corner post must be adhered to, its defects can be only partially overcome. The end framing is, of course, already partially tied in by the wall plate of the roof, and presumably by an intermediate floor; it can be further secured by wrought iron anchors screwed to the post and built into the brickwork at intervals, but the joint is practically certain to open more or less owing to shrinkage of the timber. The post should be rebated as shown in sketch A to allow the brick backing to pass behind it, but if it may not be cut, a strip of 4½in. × 3in., well coachscrewed on in the position shown in sketch B will prevent the crack (when it occurs) from extending in a straight line through the wall, as timber can be secured closely to timber, though not to brick. G.

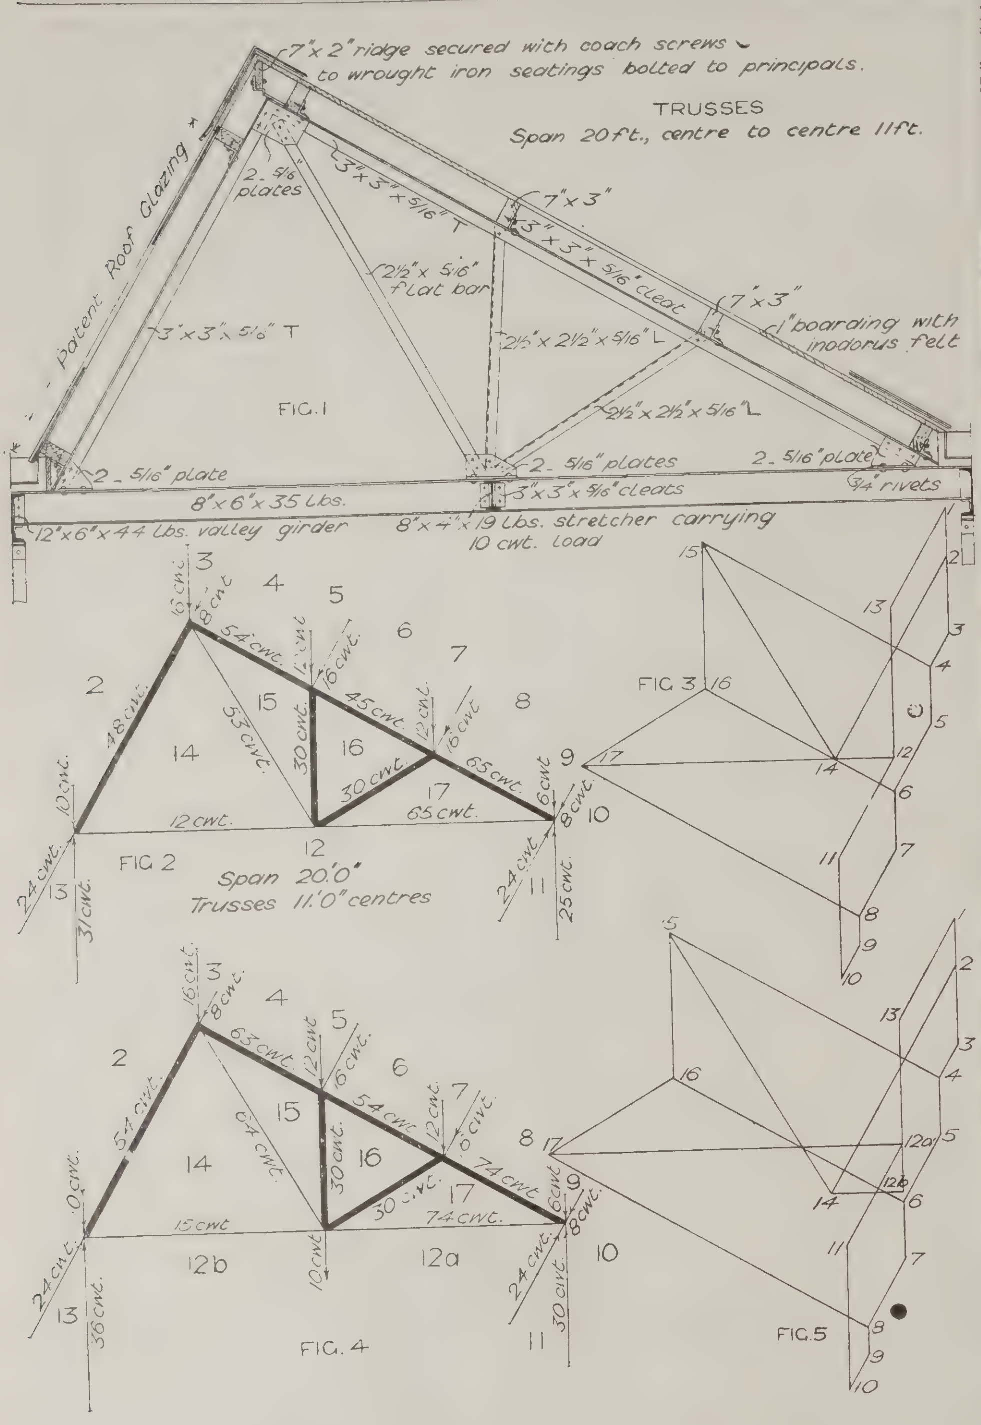
Factory Roof.

Kirkby.—Hosiery writes:—"I send herewith tracing of a roof truss [not reproduced] which I am thinking of using on a factory, and should be glad to have the opinion of your expert as to the sizes of the members of the truss. The roof on the flat side will be covered with slates. Distance centre to centre of principals, 11ft. The 8in. × 4in. × 19lbs. stretches are put in, partly for stiffening and partly for fixing stays from the machinery, and the 8in. × 6in. tie beam is for a similar purpose. There will be a good number of these trusses, and I am anxious to know whether any saving can wisely be effected. I cannot find a stress diagram of this class of roof in any text book. The position is not an exposed one."

—The design for the roof is shown in Fig. 1, and allowing for a structural load of 21lbs. per ft. sup. and a normal wind pressure of 28lbs. per ft. sup., the frame diagram with loads will be as in Fig. 2. The re-actions may easily be calculated and the stress diagram constructed as in Fig. 3, and the stresses marked on the frame diagram. The calculations will be as follows. For the principal rafter with a stress of 65 cwt. or 3.25 tons and unsupported length of 5ft. 9in. try the 3in. by 3in. by 5-16in. tee section,

Then $W = \frac{F\,S}{1+\frac{1}{a}\left(\frac{l}{d}\right)^2} = \frac{6{\cdot}5\times1{\cdot}76}{1+\frac{1}{750}\left(\frac{69}{2{\cdot}8}\right)^2} = 6{\cdot}33$ tons, so that this section will be rather more than enough, but it should not be made less, and the same section will also be sufficient for the rafter on glazed side of roof. For members 15-16 and 16-17 with a stress of 30 cwt. or 1.5 tons and unsupported length of 5ft. 9in. try a 2½in. by 2½in. by 5-16 in. angle section. Then $W = 1 + \frac{F\,S}{1+\frac{1}{a}\left(\frac{l}{d}\right)^2} = \frac{6{\cdot}5\times1{\cdot}47}{1+\frac{1}{750}\left(\frac{69}{1{\cdot}7}\right)} = 3$ tons so that this section will do for both members. Allowing 6½ tons per sq. in. member 14-15 will require an area of $\frac{53}{6{\cdot}5\times20} = 0{\cdot}4$ sq. in. net, requiring a 2½in. by 5-16in. flat bar.

Allowing for a hanging load of 10 cwt. at



ILLUSTRATING REPLY TO "KIRKBY—HOSIERY."

centre of truss the frame diagram will be as Fig. 4 and the stress diagram as Fig. 5. It will be seen that the stresses are not greatly increased and that the members previously assumed will still be sufficiently strong. There should be two rivets at the end of the inclined tension bar instead of one, and in order to obtain room for the extra rivet the plates must be increased as shown in Fig. 1.

Henry Adams.

Defective Mortar.

Leeds.—H. E. I. writes: "A dwelling-house built chiefly of brick, and to be covered with cement roughcast, has just been roofed and tiled. The mortar in the joints of all the common brickwork is not setting properly; in fact, the blade of a penknife or a sharp instrument can be pushed into almost any joint without hammering. (*a*) Can you give the cause of this? The proportions specified for mortar are 3 to 1. The lime appeared all right; the sand was got from a quarry, is practically crushed sandstone, but fairly sharp, and is commonly used in the district. (*b*) How can the mortar be tested now to see that the proportions are approximately accurate? Is not hydrochloric acid a solvent of lime? If treated with this, could the residue be taken as the sand, and weights compared before and after? Details of this or any better test will be acceptable, provided same can be carried out without exceptional apparatus. (*c*) What is the best course to adopt with the building in case it proves unsatisfactory?"

—(*a*) There are many reasons why mortar does not set, the chief being (1) unsuitable materials, (2) wrong proportions, (3) imperfect mixing, (4) climatic conditions, (5) faulty use, and (6) the bricks. The material appears to be satisfactory and need not, at the moment, be further considered. The remaining causes are less easy to ascertain in mortar which has been used, though a chemical analysis will show if the proportions of the sand and lime are correct, and a series of such analyses will show whether they have been badly mixed. A microscopic examination will also show the regularity or otherwise of the mixing. Under "climatic conditions" are such causes as frost, rain on the mortar, etc., and it is almost impossible to state whether these have influenced the setting in this particular case. This would be a matter for evidence of persons present at the erection of the building. "Faulty use" of the mortar is a frequent cause of defective setting, particularly if more mortar has been made than is required. If mortar begins to stiffen, it should not be used, but it is so easy to throw it back into the mill and to mix it up with a little fresh lime, that much defective work may be traceable to this. To some extent this may be ascertained by an analysis of the mortar, as it would probably contain an excess of lime. Other faults in use may be ascertained by an examination of the building, and a prior argument may be based on the indications thus found, though such argument is not absolutely conclusive. Defective bricks, especially if they are too porous or have been insufficiently soaked before use, will withdraw the water from the mortar so rapidly as to prevent its setting, and make it into an inert mass. The probability or otherwise of the bricks requiring special treatment can be ascertained from an examination of the bricks used, but expert knowledge is required for this purpose.

(*b*) The testing of the mortar to ascertain the proportion of lime present requires special training. It is not sufficient to treat the mortar with acid as suggested, because in setting some of the lime and some of the sand combine together, and the compounds so formed would vitiate the result. It would be far more satisfactory in every way to have an analysis made by a competent specialist, and would not be very expensive.

(*c*) There is no entirely satisfactory procedure possible, but the least costly course will be to scrape out as much of the defective mortar as possible, and to point it with a cement-mortar, composed of one part of cement to three parts of sand. If this is done on both sides of the walling, and one side is then "roughcast," it will probably be strong enough for all but very exposed positions. But before giving a definite opinion on this point, it is desirable to see the building and to inspect the mortar *in situ*.

WHY A "ROD" OF BRICKWORK?

The question has been raised, "Why is brickwork measured by the rod of 16½ ft. in length by 16½ ft. in height by 1⅛ ft. in thickness? and is the rod a land measure adapted to brickwork, or is it a brick measure applied to land?

To arrive at a solution of this interesting problem it is necessary to bear in mind that in England walls were not built of brickwork before the Tudor period; and bricks did not come into general use for ordinary houses until a somewhat later time than this. Considering that the rod appears to have been the accepted measurement of brickwork from an early period after its introduction, to determine the origin of the measure it is necessary to go still further back, and examine the method of measuring buildings before the days of brickwork.

Records of leases and sales of buildings during the Middle Ages constantly take the "bay" as the unit of measurement. Shakespeare is merely mentioning a customary standard when he says in "Measure for Measure," Act II., Scene 1: "I'll rent the fairest house in it after three pence a bay."

This unit arose from primitive timber construction, which, becoming traditional, was followed for a long time in the erection of unpretentious buildings. For all such ordinary buildings timber was the material in common use, and was generally adopted for the framing, even when other materials were employed for filling in. Such early framing consisted of "forks," corresponding to the principals of a modern roof; each was composed of two tree trunks, often bent; one end of each was bedded in the ground and the two trunks were joined together at the top. They accordingly bear a slight resemblance to a Gothic arch. A tie beam was inserted at a convenient height to hold the bent timbers together. The "forks" were connected at the apex by a ridge, and wind braces were generally added. A building with two "forks" would be spoken of as consisting of one "bay." Larger houses would have two or more "bays," with, perhaps, outbuildings attached.

A unit of measurement such as the "bay" would lead to great confusion unless there was at least an approximate standard of length for the "bays," but if such were the case it would be a reasonable and ready means of denoting the size of a building. Upon examination of many of the smaller houses, farms and barns constructed with "forks," it is found that the usual width of the "bay" is 16 ft. or thereabout.

More definite evidence of the application of the rod or perch, as a measurement for buildings, is furnished by the Domesday of St. Paul's, in which we read: "The great barn of Walton was 10½ perches in length (a perch being 16 ft.) and 3 perches and 5 ft. in breadth."

In the dimensions of the larger secular buildings, where exigencies of site or other considerations did not interfere, a multiple of 16 ft. or 16½ ft. is very commonly found, such, for example, as the old Guesten Hall, Worcester, which is 65 feet 8 inches long, with a roof of 8 bays; or the Hall of Penshurst Place, 64 ft. long with a roof of 4 bays.

As the rod was thus a standard of measurement for the general dimensions of the domestic buildings of the Middle Ages, it is not unnatural that it should be retained in computing the quantity of brickwork, when that material came into vogue for walling.

It might be urged, however, that stonework is measured by the cubic foot and not by the rod. Upon a slight consideration, the answer to this objection will be apparent, for in stonework a superficial measurement of standard thickness would introduce difficulties in calculation, where walls may be of various thicknesses, which are not multiples of a given unit, such as that provided by the breadth of a brick for brick walls of all thicknesses. Superficial measurements are more readily dealt with than cubic ones, and as brickwork of varying thicknesses can be easily reduced to a standard thickness of 1½ bricks, the reason for the retention of the rod for brickwork, but not for stonework, is clear.

To ascertain whether the rod was a land dimension applied to buildings, or a building dimension applied to land, it will be necessary to discover the method of measuring land in times gone by.

In 1592 a book was published entitled: "The Moste Profitable and Commendable Science of Surveying of Lands, Tenements, and Hereditaments: drawen and collected by the industrie of Valentin Ligh," which contains the following table:

"The partes or divisions of an acre, with the denominations of the same, according to the Statute here mentioned.

"Three Barlie cornes faire and rounde, taken out of the middell of the Eare maketh an Inche.

"Twelve Inches make a Foote.

"Three foote make a Yarde.

"Five Yardes and a halfe maketh a Perche, which in some countries men cal a Pole or Rode, a Perche.

"Foure Perches make a Day-woorke.

"Tenne daye woorkes or XI Perches maketh a Rode or Quarter of an Acre.

"Fourscore Perches or two Roodes maketh halfe an Acre.

"A hundred and IX Perches or foure Roodes make an Acre.

"And fortie Perches in length and foure in breadth is an Acre."

The combination of lineal and superficial measures in the same table, to say the least, is somewhat confusing. The daywork mentioned, though obsolete in name, still exists in the chain of 4 perches or 66 feet. The author continues with some practical hints to surveyors. He adds: "To aunswere by Rodde or by Lyne, it is at your pleasure, but of them both the Line is the speedier, and also of moste antiquitye.

"Your Line being foure perches of length, and at everye Perche ende a knot, would bee well scarred with hotte Wax or Rosen, to avoide stretching thereof in the wete, and shrinking in the draught."

Passing now to early times, in the Domesday Book there are too systems of measurement applied to land. The first, by the "Hide" and by the "Carucate," it would appear, was obsolete at the time of the compilation of the record, but was probably the result of an earlier survey of the times of Ethelred the Unready, for the assessment of the "Danegeld" tax, and was corrected and incorporated in the later survey.

The second system was that in vogue after the Norman Conquest, and is the basis of our present method of land measurement, though certain modifications were introduced before the system was sanctioned by the statute of Edward I. Most of the dimensions are lineal and not superficial. The following table gives the measurements of length:—

3 feet equal 1 yard.
5½ yards equal 1 virga or pertica.*
4 perticæ equal 1 acra.
10 acræ equal 1 quarentina.
12 quarentinæ equal 1 Leuna, Leuga, or Leuca.

The lineal acre has since become obsolete. The quarentina of 40 perches corresponds with our furlong (*i.e.*, forty long).

The present league of 3 miles is just twice the old lenga of 1½ miles.

The superficial measures ran thus:—

30¼ yards equal 1 pertica.
160 perticæ equal 1 acra.
10 acræ equal 1 quarentina.
12 quarentiæ equal 1 leuga.

From this table it will be observed that the superficial acre did not consist of one lineal acre square, but of an oblong area, whose sides are 1 lineal acre and 10 lineal acres. It appears, moreover, that many plots of ground of the extent of one acre in area were set out with a width of 4 perches and a length of 40 perches. This agrees with the apparently irrelevant statement of Valentin Ligh quoted above, "and fortie perches in length and foure in breadth is an acre."

Returning to the Saxon basis of calculation—the "Hide" and the "Carucate." These terms did not denote an exact area of land, but only gave an approximate idea for the purpose of assessment. The word "Hide" signifies a homestead, and included the land belonging to the homestead, as well as the homestead itself. The term "Carucate" comes from the "Caruca," or ox plough team; a carucate was the land for the working of which one ox team would be sufficient. The full ox team consisted of eight oxen, and similarly the carucate was divided into eight divisions called "bovates."

The measurement of land, upon the basis of the ploughing of the oxen, gives a suggestion as to the probable origin of the perch or rod of 16 or 16½ feet. This dimension is that required by four oxen working or standing side by side. The full team consisted of eight oxen, but the usual working team was composed of four oxen. What more natural method for measuring land could there be than that of calculating it by the widths of 16ft. required for its working by the oxen? This would account for the setting out of an acre, as previously mentioned, of a width of 4 perches and a length of 40 perches.

If the perch had its origin as a land measure, from the width required by a team of four oxen, there remains for consideration the reason for its application to buildings. The primitive farmhouse generally consisted of a common living and sleeping room (such as would be termed the "hall" in larger houses), with a private chamber at one end; at the other end, and under the same roof was the oxhouse and stable. Horses, in those days, were used chiefly for riding and as pack horses. As the four oxen worked side by side during the day, so they would rest side by side at night, in the same stall, and consequently they would require the same space of about 16 feet. Most authorities, from Vitruvius to the present time, agree that this width is necessary for four oxen. This unit, having once been adopted for the oxhouse, would become the unit for the remainder of the house, and, considering the acknowledged conservatism and traditionalism which characterised the builders of the time, it would readily be applied to other buildings, in which the actual necessity for this particular dimension did not exist.

Federation News.

WAKEFIELD AND DISTRICT ASSOCIATION.

Secretary: J. Beaumont.

The annual meeting of the members of Wakefield and District Association was held at the Great Bull Hotel, Wakefield, on December 2nd. Mr. Tom Lee, the retiring president, took the chair at the commencement of the meeting, and proposed the election of Alderman Judge as president for the ensuing year. The proposition having been unanimously carried, Mr. Lee, in vacating the chair in favour of Alderman Judge, extended a hearty welcome to the new president.

Alderman Judge, in returning thanks for his election, addressed the meeting on the work of the association.

The president then proposed Messrs. E. A. Elvey, H. Fallas, T. Lee, and G. Crook as vice-presidents, and on being seconded by Mr. J. W. Bramham, the resolution was carried.

The following members were elected on the general committee, viz.: Bricklayers and masons, Messrs. R. L. Leake, J. Pashley, D. F. Parker, J. W. Bramham, and G. Clements. Joiners, Messrs. W. J. Atkinson, H. Blackburn, J. Lazenby, J. H. Broadhead. Plasterers, Messrs. J. W. Sanderson, and T. E. Senior. Plumbers, Messrs. W. H. Moss and H. Gillott.

The retiring president (Mr. T. Lee), and Mr. H. Fallas, were elected as the representatives of the association, on the Yorkshire Federation Council, on the motion of Mr. J. W. Bramham, seconded by Mr. Elvey, and the secretary, (Mr. J. Beaumont) was re-elected on the proposition of the president, seconded by G. W. Elvey.

The annual accounts were submitted by the secretary, duly audited by Mr. Lee, and Mr. Gillott, and were adopted.

EDINBURGH, LEITH, AND DISTRICT BUILDING TRADES ASSOCIATION.

Secretary: James Cameron.

The monthly meeting of the executive of Edinburgh, Leith, and District Association was held in the Building Trades Exchange, 61, Lothian Road, Edinburgh, November 25th. There was a good attendance, presided over by Mr. James Millar, in the absence of the chairman, Mr. Mekie, who was ill.

A letter was read from the secretary of the National Federation, as to conditions under which tenders are sent in, and several concrete cases were given by the members present of what they considered unreasonable demands made in certain conditions of contract. The secretary was instructed to supply the National secretary with the information regarding these cases, in view of the meeting to be held with the president and officers of the Royal Institute of British Architects on December 13th.

With regard to the German-made schools being erected in Leith, the secretary gave a report of the protest meeting recently held. It was agreed to make an examination of the work and report, and five gentlemen were appointed for the purpose.

Under this heading the secretary referred to the publicity given to the question of the

---

*"Pertica" is the origin of our word "perch," and signifies a wooden rod or pole. It was used for example for the perch for hawks in old houses.

German-made schools in the "Builders' Journal," and urged the members to become subscribers. It was agreed to bring the claims of the journal under the notice of the members at the annual meeting, and the secretary was instructed accordingly.

NORTH SHIELDS, WHITLEY AND DISTRICT.

Secretary: John R. Hadaway, C.A.

The annual meeting of the North Shields Whitley, and District Master Builders' Association was held on November 30th at the association's offices, Howard Street, North Shields, when Mr. Joseph Pelton presided over a representative attendance of members. The secretary (Mr. John R. Hadaway, C.A.) presented the annual statement of accounts, which were considered highly satisfactory.

The President congratulated the members upon the state of the association's finances, and was pleased to say that the relations between the building trade employers and employees continued to be of a pacific character. In spite of the depression in trade during the past year no reduction had been made in the wages of the operatives.

The election of officers for the ensuing year resulted as follows:—President, Mr. John T. Scott; vice-presidents, Messrs. W. S. Shepherd and Joseph F. Newbold; treasurer, Mr. J. G. Fell; auditor, Mr. Gilbert Park; representatives of the Northern Counties Federation of Building Trades Employers, Messrs. John T. Scott, Joseph Pelton, and Joseph F. Newbold; representatives to the Tyne and Blyth Federation of Building Trades Employers, Messrs. W. S. Shepherd and J. G. Fell.

Tyne and Blyth District Federation.

The annual dinner of the Tyne and Blyth District Building Trades Federation was held at the County Hotel, Newcastle, on December 7th. The President of the Federation (Mr. W. T. Weir, of Howden) was in the chair, and he was supported by a large company, including Coun. J. T. Armstrong (South Shields), vice-president; the Sheriff (Mr. W. R. Armstrong), Coun. Johnstone Wallace, Deputy Lord Mayor of Newcastle; Coun. W. Foster (Pelaw), president of Newcastle Association; Mr. A. G. White (London), secretary of the National Federation of Building Trade Employers of Great Britain and Ireland; Mr. Joseph Duffy, Mayor of Wallsend; Coun. Stephen Easten; Mr. John T. Scott, President of the North Shields Association; Mr. G. T. Brown, of Sunderland, President of the Northern Architectural Association, etc., etc.

After the toast of "The King," Councillor J. T. Armstrong gave "The National Federation of Building Trade Employers." He said there was no trade with greater need of organisation than the building trade. They had to face strong competition, and they carried with them very great risks, but their National Federation was doing much to break down the risks that were imposed upon them. The aims and objects of the National Federation were not entirely of a selfish nature. The Federation did much work in connection with Parliamentary Committees, and the meeting of deputations, and if the outcome of this work was successful, he ventured to say that in seven cases out of ten it was the proprietor and owner of works that benefited rather than the actual builder.

Mr. J. W. White, a vice-president of the National Federation, responded. He said that all the builders wanted was a perfectly fair agreement to both sides to a contract. He was glad to say that in this district they had made considerable progress. There had been some tilting against the Conciliation Board, but the great thing to remember was that this Board, promoted by the Federation, held the field. During the last four years there had been no strikes throughout the country in the trades connected with the Federation. He went on to say that they were having too much legislation, too much Parliamentary interference. They had had new rules recently in respect of scaffolding, and the arrangements for building; this year they had had Labour Exchanges; next year they were to have insurance against unemployment; and when they coupled with that the Board of Trade returns, Workmen's Compensation Act, the Factory Acts, and so forth, they would wonder whether in their offices they were really builders or lawyers. He doubted whether the Labour Exchanges would justify their expense, but the builders would give them an honest trial. As to insurance against unemployment, he thought this question might be better combined with the Compensation Act.

Mr. A. G. White (secretary of the National Federation) gave "The Tyne and Blyth District Building Trades Federation." He said their organisation and other similar organisations had resulted from defensive needs. Like the workmen, they were relying on moral force. It was true, he said, that they had conditions of contract which were in the main satisfactory, but incidental to the obtaining of tenders there were a number of conditions which were imposed on tenderers which were anything but satisfactory, and he hoped a movement which had begun in the shape of a conference arranged between the professional bodies would ultimately result in a very much-needed reform in this direction. It was simply outrageous some of the things that were put forward. In proposing the toast of the "Tyne and Blyth District Building Trades Federation," he said that he was peculiarly interested in that District Federation, which embraced towns where the local conditions were analogous. It was much better that they should co-operate for their own benefit, than that they should indulge in any kind of rivalry. The best way to avoid trouble was to organise to meet it. It was the great Napoleon who said that in dealing with an adversary the moral effect that one was able to produce upon him compared with the physical effect as three to one. He took it that it was chiefly the moral effect that they relied upon to secure them the things they had in view. (Hear, hear.) He was sorry to say that his excellent chief, Mr. Brown, the president of the National Federation, was unable to be with them that night, but he sent them his best wishes for their success and a speedy return to better conditions.

The toast was responded to by the various local presidents. The Chairman (Mr. Weir) said they had been passing through very depressed times, but he thought there were indications all round of better trade. Probably they were themselves to blame for the ill-effects resulting from depression, as they had so cut up business that very little profit had accrued. With their better organisation he hoped they would have more sense, and see that they got a fair return for their work. He trusted also that all the builders in the district would join their Federation. It was hardly fair that builders, and even quantity surveyors and architects, should benefit from the organisation of others.

Coun. W. Foster (Pelaw) also responded. Times doubtless had been depressed, but they would have been much worse if the coal trade had not been prosperous, and it was on account of that that he hoped there would be no trouble about introducing the Eight Hours Act.—The toast was further spoken to by Coun. J. T. Armstrong, Mr. John T. Scott (North Shields), and Mr. J. Simpson (Blyth).

Coun. S. Easten proposed "The Architects, Engineers, and Surveyors," He said the position of builder and architect was peculiar, but he was willing to admit that the large majority of architects, whilst understanding their power under the contract forms, wielded that power very fairly. A the same time, he thought it was unfair tha where disputes occurred between two parties the question at issue should be referred to a third and interested party.

Mr. G. T. Brown, F.R.I.B.A., responded As a class, he said, architects realised tha they were part of the building trade itself They were all, builders and architects, absolutely interdependent upon each other. H trusted that the deliberations in progres with regard to sub-contracting and separat trades would result in a satisfactory arrangement. Under the present form of Institut contract the architects' powers had been considerably curtailed, and there was now n reason for any contractor to assume that h was not, under this contract, going to ge fair treatment. He would suggest that thei Federation should acquaint their member with the effect of the various general conditions under the existing contract which applied almost generally in the North of England.

TO CONTRIBUTORS.

Owing to the very large number of voluntary contributions submitted to the Editor, it has been found desirable to make the following regulations:—

1.—Intending contributors are advised to send a preliminary letter before forwarding articles and illustrations. The non-receipt of a reply within one week is to be taken as a polite negative. MSS. and drawings in all cases should be accompanied by sufficient stamps to cover return postage.

2.—The Editor declines to take any responsibility for the safety or return of contributions submitted, although every care will be taken where these regulations are complied with.

3.—Each MS. and illustration should bear the name and address of the owner or sender.

Milsom and Booth, £2,210.

BIRMINGHAM CLERK'S OF WORKS AND BUILDER'S FOREMAN'S ASSOCIATION.

By the courtesy of the Rev. Fathers, the members and friends of the above association were invited to inspect the now completed memorial church, erected to perpetuate the memory of the late Cardinal Newman. The party were conducted over the building by Mr. W. H. Francis, Clerk of Works, and greatly admired the design and workmanship of the church, which has been erected regardless of cost, and without a competitive tender, from the designs of Mr. Dorian Webb, of Salisbury.

The new structure was adapted from the church of Saint Martino di Monti, at Rome, the style being early classical, but instead of the flat roof of Saint Martino, the architect has introduced a barrel roof and dome of reinforced concrete. The great features of the building are the monolith marble columns, each about 17ft. 6ins. high, with a girth of 6ft. 8ins. In addition to these columns, each costing over £200, the marble panel work at the back of the Sanctuary, together with that of the choir gallery, is very beautiful and attracts great attention and admiration. At the conclusion of the inspection a vote of thanks was accorded to the Rev. Fathers of the Oratory, the architect, the builder—Mr. E. Linzey, of Trowbridge, and the Clerk of Works.

This form should be cut out and sent with remittance to: The Manager, "THE BUILDERS' JOURNAL"
Caxton House, Westminster.

"THE BUILDERS' JOURNAL"

PREPAID ADVERTISEMENT FORM.

PLEASE WRITE CLEARLY.

Advertisements must reach Caxton House not later than 5 o'clock Monday.

Burnham and Co.), 559; Girard Trust Buildings, Philadelphia (McKim, Mead, and White, and Allen Evans), 560, 561; The State Savings Bank, Detroit (McKim, Mead, and White), 560; Rotunda, Old National City Bank, New York (Isaiah Rogers), 561 (see also 554, 555, 556, 561); Cleveland Trust Bank Plan (Geo. B. Post and Sons), 561 (see also 552); Chicago National Bank Plan (Jenney and Mundie), 561; Girard Trust Building, Philadelphia, Plan, 561; Students' Prize-winning Plan for a Savings Bank (John Russell Pope), 562 (see also 549); First National Bank, Pittsburg (D. Burnham and Co.), 565; Illinois Trust Company's Building, Chicago (D. H. Burnham and Co.), 564; Knickerbocker Trust Building, New York (McKim, Mead, and White), 565, 566, 567; Canadian Bank of Commerce, Montreal (Frank Darling), 568, 570, 571; Crocker-Walworth Banking Hall, San Francisco (A. Page Brown and Julius Schweinfurth, 569; Tiffany Building, New York (McKim, Mead, and White), 572; Shop Fronts, Guaranty Building, Buffalo (Louis H. Sullivan), 572; (see also 537); Gorham Building, New York (McKim, Mead, and White), 573; Arc Lamps Detail (Louis H. Sullivan), 573; Bronze Screen Detail (Louis H. Sullivan), 574; Dressmakers' Premises, New York (Warren and Wetmore), 574; Scribner's Book Shop, New York (Ernest Flagg), 575; Shop Fronts, St. James Building, New York (Bruce Price), 575; Tiffany House, New York (McKim, Mead, and White), 576; Cable Building, New York (McKim, Mead, and White), 577; Selfridge Store, Original Design (D. H. Burnham and Co.), 578; Gimbel Brothers' Building, New York (D. H. Burnham and Co.), 578; People's Gas Company Building, Chicago (D. H. Burnham and Co.), 579; Altman and Co.'s Store, New York (Kimball, Thompson, and Mackintosh), 580, 581; American Insurance Company Building, New York (Cass Gilbert), 581; Chickerinh Hall Pianoforte Show-rooms, Boston (Peabody and Stearns), 582, 583; Bush Terminal Company's Offices, New York (Kirby, Petit, and Green), 584; Singer Building Addition (Ernest Flagg), 585; Office Building, Walkerville, Ontario (Geo. D. Mason and Albert Kahn), 586; Metropolitan Life Insurance Building, Baltimore (N. Le Brun and Sons), 586; Customs House, New York (Cass Gilbert), 587; Dome of Rhode Island State House (McKim, Mead and White), 588 (see also 592); George Washington Memorial Buildings, Washington (Geo B. Post and Sons), 589; Connecticut Savings Bank (Gordon, Tracy, and Swartwout), 590 (see also 558); National Farmers' Bank, Owatonna (Louis H. Sullivan), 590; Library, Columbus, Ohio (Albert Randoll Ross), 590, 592; New Music Hall, Boston, Mass. (McKim), Mead, and White), 591; Metropolitan Club, New York (McKim, Mead, and White), 591; Rhode Island State House (McKim, Mead, and White), 592 (see also 588); Approach to the Library, Columbus, Ohio (Albert Randolph Ross), 592 (see also 590); New York University (McKim, Mead, and White), 593; Columbia University Library (McKim, Mead, and White), 594; College of the City of New York (Geo. B. Post), 595, 599; United States Court House and Post Office, Indianapolis (Kellogg, Rankin, and Crane), 596, 597, 600; Wisconsin State Capitol (Geo. B. Post and Sons), 598; New York Stock Exchange, Plans, 598; Madison Square Gardens, New York (McKim, Mead, and White), 599; Carnegie Branch Library, New York (McKim, Mead, and White), 600; Brooklyn Institute of Arts and Sciences (McKim, Mead, and White), 600; Swimming Pool, Phipps Natatorium, Pittsburg (Grosvenor Atterbury), 601; New York Stock Exchange (Geo. B. Post and Sons), 601; Buildings at the Alaska-Yukon Pacific Fair, Seattle, 602, 603, 604, 605; Suggested Improvements, Newport Harbour, Rhode Island (Geo. P. Post and Sons), 603; Union Station, Washington (D. H. Burnham), 606, 607; Free Christian Church, Andover, Mass. (McKim, Mead, and White), 608; Union Station, Pittsburg (D. H. Burnham and Co.), 608. United States Capitol Group:—Office Building of the Members of the House of Representatives (Thomas Hastings), 609; Corner of ditto, 609; Office Building of the Senators (John M. Carrère 624; Corner of ditto, 610; Rotunda, Office Buildings of the House and Senate Carrère and Hastings), 610; Waiting-room in the Office Building of the Senators, 610.

REPORTS AND PERSONALIA OF THE YEAR—

R.I.B.A.:—Mr. Ian Macalister, Secretary, 612; Mr. Ernest George, President, 613; Mr. J. G. S. Gibson, Professor Reginald Blomfield, Mr. A. W. S. Cross, and Mr. E. Guy Dawber, Vive-Presidents, 613; Dr. A. J. Evans, Royal Gold Medallist, 1909, 614.

THE ARCHITECTURAL ASSOCIATION:—Mr. Henry Tanner, President, 615; Mr. F. Dare Clapham, and Mr. C. Wontner Smith, Vice-Presidents, 615; Mr. Maurice Webb and Mr. Edwin Gunn, Hon. Secretaries, 615; Mr. D. G. Driver, Secretary, 616.

THE SOCIETY OF ARCHITECTS:—Mr. G. E. Bond, President, 616; Mr. C. McArthur Butler, Secretary, 616.

THE QUANTITY SURVEYORS' ASSOCIATION:—Mr. H. T. A. Chidgey, President, 617; Mr. A. G. Cross, Secretary, 617.

PRESIDENTS of SOCIETIES ALLIED to the ROYAL INSTITUTE of BRITISH ARCHITECTS:—Mr. Arthur Clyne (Aberdeen), 617; Mr. Mowbray A. Green (Bristol), 617; Mr. E. J. C. Down (Cardiff, South Wales, and Monmouth), 617; Mr. W. H. May (Devon and Exeter), 618; Mr. J. T. Maclaren (Dundee), 618; Mr. John Watson (Edinburgh), 618; Mr. George Bell (Glasgow), 618; Mr. F. Batchelor (Royal Institute of Ireland), 619; Mr. G. F. Beckett (Arch. Association of Ireland), 619; Mr. Percy Robinson (Leeds and Yorkshire) 619; Mr. T. E. Eccles (Liverpool), 619; Mr. G. T. Brown (Northern Association), 620; Mr. A. E. Heazell (Nottingham), 620; Mr. Thomas Monkman (York and Yorkshire), 620; Mr. W. J. Hale (Sheffield), 620.

NATIONAL FEDERATION OF BUILDING TRADE EMPLOYERS:—Mr. Ernest J. Brown, President, 623; Mr. S. Smethhurst, Senior Vice-President, 622; Mr. A. G. White, Secretary, 622; Mr. F. G. Rice (President), Mr. Thomas Costigan (Secretary), London Master Builders' Association, 624.

RECENT BRITISH BUILDINGS:—The Victoria and Albert Museum (Sir Aston Webb), 625, 626, 627, 628, 629; Birmingham University (Sir Aston Webb and E. Ingress Bell), 630; Ashton Memorial, Lancaster (John Belcher), 631, 632; Dunkeld Cathedral Restoration (W. Dunn and R. Watson), 633, 634; Chelsea Town Hall Extension (Leonard Stokes), 635, 636; The Selfridge Store (R. Frank Atkinson), 637, 638; Central Free Library, Nelson, Lancs. (John R. Poyser and W. Brandreth Savidge), 639, 640; Edinburgh Life Assurance Building (J. M. Dick Peddie), 641; Additions to Glasgow Central Station Hotel (James Miller), 642; St. Albans High School for Girls (Amian L. Champneys), 643, 644; St. Peter's School, Weston-super-Mare (W. H. Ward and Gerald Cogswell), 645, 646. Hammersmith Public Baths (J. Ernest Franck), 647, 648; Churchill Cottage Homes (Silcock and Reay), 649; St. Paul's Church, West Ealing (Hall-Jones and Cummings), 650; Royal Automobile Club, Pall Mall (Mewès and Davis, and E. Keynes Purchase), 651, 652, 653, 654; Dodford Church, Worcestershire (Arthur Bartlett), 658; The Tower Building, Liverpool (W. Aubrey Thomas), 656, 657; Westminster Trust Buildings, Westminster, 658; Manley Gasworks, Sidney, N.S.W., 659; Bridge at East Retford, 659; Corn Mill, Bristol (W. H. Brown), 660; Engineering Workshops, Silvertown, E., 661.

CONCRETE AND STEEL IN 1909—

Anglo-South-American Bank, Broad Street, London, 664; Warehouses, Watling Street, London, 664; The Dolphin Bridge and Viaduct, Norwich, 665; Caxton House, Westminster (west block), 666; Coal Bunkers, Hamersmith, 666; Western District Post Office, Wimpole Street, London, 667; The King' House, Kingston, Jamaica, 667; New Secondary Schools, Barnstaple, 668; Albert Foundry, Belfast, 668; Secondary School, Sowerby Bridge, 668; Boot Factory, Bromsgrove, 668; New Garage and Warehouse rooms, John Bright Street, Birmingham, 669; Reservoir at Whaley Bridge, 673; Oldknow Road Schools, Birmingham, 673; Derwent Viaduct, Ambergate Reservoir, 673; Salford Public Baths, 673; Manchester Telephone Exchange, 674; New Barnet Church, 674; Bridge and Viaduct at Broadheath, 675; Stores for Messrs. Whitbread and Co., Chelsea, 675; Retaining Wall, Messrs. Mappin and Webb's premises, Queen Victoria Street and Cheapside, London, 676; Jam Factory, Dublin, 676; New General Post Office Building, south side, 677; Water Tower for the Great Marlow Water Co., 677; Grand Stand for the Rugby Football Union, Twickenham, 678; Roof Trusses, National Gallery, London, 678; Bank of England Records Office, Roehampton, 678; Pavilion for the Leeds Golf Club, Ltd., 679, 686; Yeadon and Guiseley School: Floor and Swimming Bath, 679; Leeds Maternity Hospital, 679; Central Free Library, Birmingham, 680; Chestnut Isolation Hospital, 680; Heles School, Exeter, 680; Teignmouth Sea Defence Works, 680; Royal Mail Steam Packet Co.'s Premises, Kingston, Jamaica, 681; Dunlop Rubber Co.'s Extension of Premises, Aston, Birmingham, 681; Bridge over the London and South-Western Railway, 682; Tank at Kempton Park, 682; Pier, Las Palmas, 683; Driving Kahn P[illegible]es, 683; Warehouse at Colombo, 683; Stand, Doncaster Racecourse, 684; Cocoa Factory for James Epps and Co., 684; Queen's Theatre, Dublin, 685; Grain Stores for Isaac Andrews and Sons, Belfast, 685; Walney Island Bridge, 685; Workshops for Henry Atkinson and Sons, Leeds, 686; interior, Kodak Works, Wealdstone, 687; Wharf at Portslade, 687; Birmingham Telephone Exchange, 688; Panton Street Brewery, Cambridge, 688.

WORK

with these Materials
—they will do justice
to your Craftmanship.

MINERVA PAINT

Composed of **Genuine** Materials only—thoroughly amalgamated. Four Whites and 120 Colors.

SATINETTE White Enamel

Produces a finish like Choice Old China—Purely White, Perfectly Smooth and Very Durable. Gloss White, Flat White, and 36 Colors, or any Shade matched to order.

DEYDO Cold Water Paint

for Beautiful Flat Tints—Sanitary, Washable, Weatherproof, and Fire-Resisting. White and 33 Colors.

VENUS Fine Copal VARNISHES

Interior and Exterior. Will not crack, chip, peel off, bloom or " scratch up " white—are extremely durable and dry with a magnificent lustre.

Full Particulars, Prices, Shade Cards, &c., concerning all our Specialities, will be sent post free, upon request to:

THE BUILDERS' JOURNAL

AND ARCHITECTURAL ENGINEER.

Caxton House. Westminster.

TO ALL OUR READERS AT HOME AND ABROAD: A HAPPY AND PROSPEROUS NEW YEAR.

Foreword. It is with mingled pleasure and relief that we place before our readers this Special Issue of the "Builders' Journal," the production of which, as its mere bulk would suggest, has entailed a vast amount of labour and expense. If it meets with the same warmth and generosity of approval with which its predecessors were greeted in every direction, at home and abroad, we shall see of the fruits of our labour and be satisfied. Its commercial success is already beyond conjecture, the orders for it having exceeded our utmost anticipations; and we entertain no misgivings as to our readers' approval of its contents. For our part, we venture to believe that it is the best of the series; in which case we may perhaps be pardoned the pride and pleasure we feel in having not only sustained but increased the reputation already enjoyed by our firm for unrivalled courage and enterprise, by producing, for the third successive year, a volume of unique interest, and of unexampled quality and value.

1909. At the beginning of 1909 hope ran high that the general depression of trade, which had so long reacted with disastrous consequences on the profession and business of building was about to disappear; but, unfortunately, it must now be confessed that the net result of the twelvemonth's experience is the addition of yet one more to the already long list of lean years. Still, on the whole, the indications, rather than the material advantages, have been sufficiently encouraging to sustain heart and hope, and to foster the belief that matters are really mending, if with tedious slowness and almost imperceptibly. There can be no doubt that the tardiness of recovery in our own country is largely due to political unrest. Capital has been locked up, and enterprise has been daunted, by the creation of a new set of financial conditions, whereof the consequences are not easy to estimate, and by the uncertainty as to whether or not the country will accept them. Until the matter is definitely settled one way or the other, and the political atmosphere becomes clear enough to enable the capitalist to take his bearings, and shape his course, substantial improvement is impossible. The result of the next general election may or may not re-establish confidence. It may possibly be so indecisive as merely to postpone the event and prolong the agony of suspense. But to hope for the best is to help to ensure it.

Important Buildings. Naturally, a year that has been fraught with so much uncertainty and anxiety has not been very prolific of building operations. Nevertheless, the important buildings that have been finished or begun during the past twelvemonth make a tolerably respectable, if not an imposing, list, as the selection described and illustrated in the present issue will serve to suggest. The new University of Birmingham, which, designed by Sir Aston Webb and Mr. Edward Ingress Bell, was opened by the King on July 7th, may be said to represent an entirely new spirit in this class of building; the studies in the university being largely, if not chiefly, of a practical and technical character, and the elevation of the building revealing very frankly the purposes to which it is being put. It is illustrated in the present issue, as well as in that for July 7th. The completion of the Royal Victoria and Albert Museum, and its opening by the King on June 26th, were duly chronicled in our issue of June 30th, and an illustrated description of this notable building is given in the present issue. The completion of the Selfridge Store marked a new era in the style and structure of business buildings in London. The controversy as to the design for London County Council's new hall has not wholly subsided. In April it was stated by the Establishment Committee that the architect had come to the conclusion that "he can greatly improve the appearance of the centre portion of the river front," and his amended design received the approval of the assessors; but apparently no mere modification of the original design will satisfy the malcontents, whose opposition was vigorously renewed on this announcement. Early in the year it was decided that the proposed memorial to Shakespeare should take the form of a national theatre, which is to be built, on a site that is not yet chosen, at a cost of perhaps, £100,000.

R.I.B.A. Topics. The year will not be altogether undistinguished in the annals of the Royal Institute of British Architects. On May 17th and 24th, and June 7th, a special general meeting was held to consider the proposals of the Council for the revision of the by-laws under the new Supplemental Charter, the chief points in which were set forth in our issue of May 19th. The Supplemental Charter will broaden the basis and extend the influence of the R.I.B.A., by giving it power to admit within the fold all who possess the necessary qualifications. "It will empower us," said Mr. Ernest George, in his presidential address delivered on November 1st, and summarised in the "Builders' Journal" of November 3rd, "to open the gates of the Institute for the space of one year for the admission of the large number of practising architects of good standing who are still unattached to our body." Then, the Institute "representing practically the whole of the architectural profession in this country," Parliament is to be asked for larger powers. This, of course, means registration, of which, therefore, 1909 seems to have brought us almost within measurable distance. The question of registration no doubt had an influential bearing on the election of the new Council of the R.I.B.A., and the result of the election was flattering to the friends of the movement. The new Supplemental Charter received the Royal approval, and the reconstruction of the R.I.B.A. on a broader basis is apparently not far off. Under the new by-laws, it was decided to add two Associates to the Council (six instead of four), thus increasing the Council to forty-two.

The Architectural Association. The "Junior Institute"—the Architectural Association—is to become still more like its parent in one of its most agreeable features, the "At Homes," which have proved so successful with the senior body, and should afford a no less valuable means of intercourse between members of the Association who otherwise would have no easy means of meeting each other. The Association, which is perhaps mainly educative in its character, wisely lays stress on the social and recreative side; and the proposed formation of a golf club gives promise of a notable addition to the amenities. A slight falling off in the membership is regrettable, but was rather to be expected as a result of the business depression, which has been acutely felt among architects.

The Building Exhibition. Foremost among the events of the year was the Building Exhibition, which was held at Olympia from April 17th to May 1st, and was in many respects the most successful of the series. In a normal state of trade, the accruing business results would doubtless have been vastly better; but we understand that, in the circumstances, most of the exhibitors had no reason to feel dissatisfied. As Mr. Ernest George said, in the speech he made at the opening ceremony, "Such an exhibition as this teaches us a great deal, and it is our business to know what is going on in the building world. We find here examples of every material and appliance to help us in building, and those who pursue that most important art should be fully cognisant of all that is happening in connection with it." In furtherance of this object, we published, in our issues of April 21st and April 28th, the fullest and best account (copiously illustrated) that has ever appeared in connection with these exhibitions; and, in particular, the issue of April 21st is, as to both bulk and quality, probably without a parallel in periodical literature of the kind.

Thames Bridges.

The bridging of the Thames is still engaging a great deal of attention. The St. Paul's Bridge scheme has been put forward with a view to relieving the growing congestion of traffic, and would represent a fairly large experiment in sectional town planning; but that the whole subject involves architectural as well as engineering considerations will have to be kept steadily in view. An illustrated article by Mr. Robert Boyle, B.Sc., on "The Bridge Beautiful, and Otherwise," in our issue of August 25th, is of timely value The widening of Blackfriars Bridge was completed in September, and in our issue of September 22nd we were able to give an authoritative account of the work. The subway constructed as a part of the widening scheme was opened on November 29th.

Town Planning.

Town planning has naturally received a great deal of attention. Several important lectures, dealing with its various phases, have been delivered during the year, notably by Mr. H. V. Lanchester, Mr. Inigo Triggs, and Mr. Raymond Unwin; and the two last-named architects have each published an important book on town planning. There have been also several important conferences on the subject, but these have been necessarily tentative and indeterminate. The latest of them, however—that held at the Westminster Palace Hotel on December 14th and 15th—got as far as the nomination of an advisory committee. A Town Planning and Housing Exhibition was held at the Hampstead Garden Suburb from July 14th to August 7th, and Mr. Ernest George, Prof. Beresford Pite, Mr. Raymond Unwin, and Mr. S. D. Adshead were present at the opening ceremony. The visit of a large party of professional men, members of town councils, and others to Germany, to study the methods of town-planning in that country, was no doubt highly instructive, and must have a considerable bearing on the administration and interpretation of the new Act. It was described by two of the visitors in our issue of May 19th. In revenge, a party of 200 members of the German Garden City Association visited this country in July, and found that we have examples worth imitating. Another notable Garden Suburb enterprise is being developed at Winchmore Hill, near Enfield, where stress is to be laid on architectural design. The French, who have never been indifferent to town planning, have in hand a gigantic scheme for widening and extending the Boulevard Haussmann, and they are evidently growing restless under the accusation that Paris has, of recent years, made but little effort to sustain her reputation as one of the finest cities of the world. Rome also has its town-planning scheme, which, as first put forward, was of such a drastic character as to threaten the destruction of many venerated buildings. It has since been considerably modified.

Architectural Education.

The year has seen a considerable advance towards the reform of architectural education. To this subject the "Builders' Journal" has devoted constant and careful attention; and the attitude on the question which we have consistently maintained is that what is required is a system of training modelled on that of the Ecole des Beaux-Arts. To this view the new Council of the R.I.B.A. shows a decided inclination, and Mr. Ernest George's presidential address contained for us no more welcome announcement than that careful consideration was being given to a scheme for founding a British Architectural School of Rome. Recent modifications in the R.I.B.A. examinations have been fully dealt with in our issues of August 18th, September 22nd, and September 29th. Another educational idea that has assumed form and substance during the year is that in connection with the new Chair of Civic Design and Landscape Architecture, founded through the generosity of Mr. W. H. Lever, M.P., at Liverpool University, to which chair the Council of the University, at a meeting held on March 23rd, appointed Mr. Stanley Davenport Adshead, F.R.I.B.A., in whom Mr. C. H. Reilly, the Roscoe Professor of Architecture at the University, has a worthy coadjutor. During the year, Prof. Reilly visited the United States with the object of studying American methods. The character of the very practical educational work that is being done in Liverpool University was well shown by illustrations in our issue of August 4th; and an important and timely article on "The Ecole des Beaux-Arts, its teaching and its influence on American Architecture," by Paul Cret, was given in our issue of August 11th. An account of the new architectural day school at the Birmingham Municipal School of Art appears in the same issue.

Competitions.

Competitions have been this year less remarkable for their number than for the extraordinary amount of dissatisfaction to which their results have given rise. Indeed, so much "feeling" has arisen, and so many nice points have been raised, that some means of modifying the method of conducting competitions would seem to be eminently desirable in the interests of all concerned. One point that has been made quite clear by coincidence of independent opinions of counsel, obtained by dissatisfied competitors in the case of the Middlesbrough Public Library designs, is that, under ordinary conditions, the competitors are absolutely without remedy, because the organisers of a competition are always safe in accepting the award of the assessor, who, not being a contracting party, is under no legal obligation to the competitors. The question no doubt bristles with difficulties; and it is to be hoped that the R.I.B.A. will give it careful reconsideration in the light of the somewhat harassing experience of the past twelvemonth.

Society of Architects and Registration.

The Society of Architects, which this year issued its twenty-fifth annual report, saw this year a most encouraging result of its long and strenuous fight for registration. The Society's Branch in South Africa promoted a Bill in Parliament, and it was read a first time in the Assembly at Pretoria at the end of June. It was then referred to a Select Committee, who, after hearing the evidence of the promoters, recommended the Bill for adoption by the House, and on July 7th the Bill was read a third time and passed without opposition. The Institute of Architects in New South Wales is working with the same object, and with a fair prospect of obtaining a similar measure of success. The one point of regret is that the Mother Country has not been able to show the Colonies a concrete example.

Quantities and Contracts.

One of the most considerable movements of the year was that which came to a head on October 13th, when a conference, convened by the President of the Quantity Surveyors' Association, was held at the Holborn Restaurant to consider the question of the non-provision of quantities by building owners when inviting tenders from contractors. A resolution disapproving of the practice was passed, and the conference recommended the Council of the Institute of Builders, the London Master Builders' Association, and the National Federation of Building Trades Employers, to urge their members to refuse to tender in competition without quantities for works costing £500 and upwards. This, and the revolt against the one-sided character of conditions of contract, and the designation of the official architect or engineer as referee in cases of dispute, have been among the burning questions of the year.

Earth Tremors.

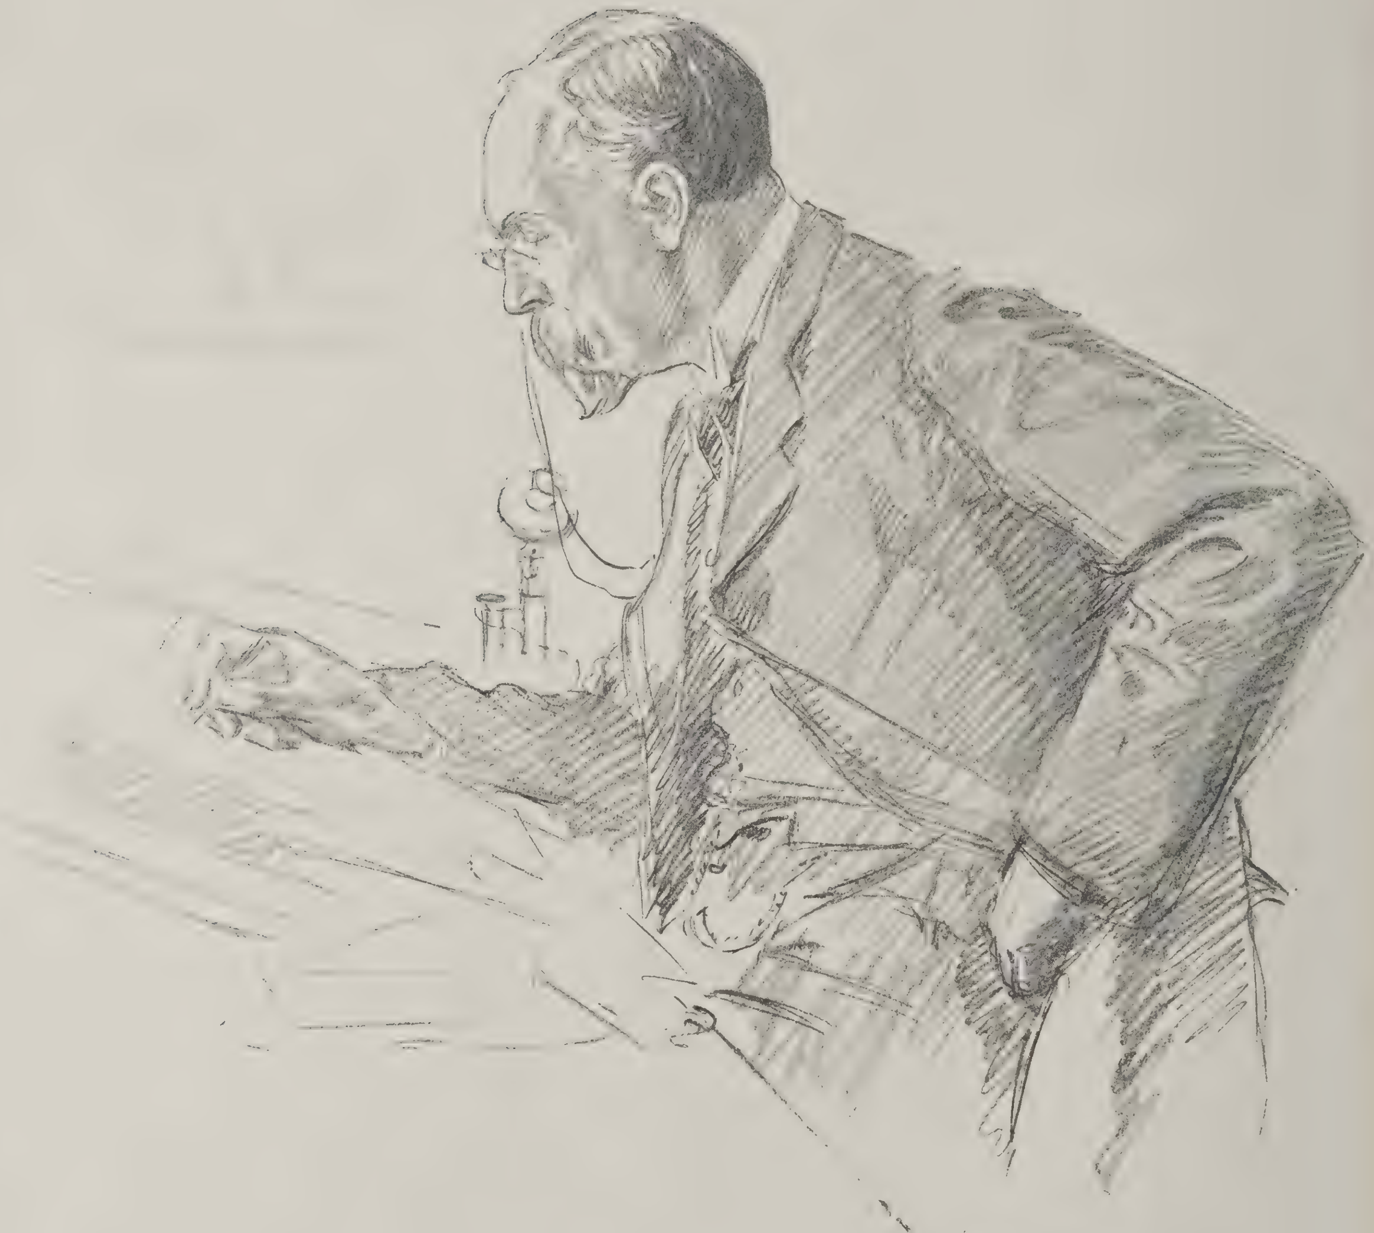
Consequent on the Messina disaster, much attention has been directed towards earthquake resisting construction, and we have been able to publish the results of some careful observations on the spot by an English expert, who, while refraining from premature conclusions, has been able to put forward some very valuable suggestions on the subject. In May, a system was patented by Dr. J. A. Calantarients. It was described in our issue of June 23rd. Somewhat imaginatively, perhaps, earth tremors were at first thought to have caused the outstanding accident in this country during the year—the disaster at Newport (Mon. in June, when, by the caving in of a large dam at the new dock works, abou thirty lives were lost.

Professional Interests.

The question of architectural copyright ha been brought forwar very prominently. I has received due attention in th "Builders' Journal," and the case fo copyright was clearly and authoritatively put in our issue of May 26th. Th thirty-seventh annual congress of Frenc architects, which was held this year a Toulouse (June 20th-26th) was largel occupied with the question of apprenticeship, a fact that marks rather strikingl the wider horizon that the French architect allows himself as compared with hi British confrère. The Guild of Architects Assistants, the formation of which wa suggested in our columns by Mr. E. J Dixon, A.R.I.B.A., last year, began t take shape in March last, when the inaugural meeting was held at the Tudo Hotel, Oxford Street, W., and subsequently a successful meeting was held i Cardiff. The question of professiona tendering has been taken up with muc vigour by the Quantity Surveyors' Association, who seem to us to have right an reason on their side in objecting to th demoralising practice of inviting professional men to make bids for work.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

Supplement to The Builders' Journal and Architectural Engineer, Edition de Luxe, *December* 31, 1909.



ARCHITECTS OF THE DAY—IX. PROFESSOR REGINALD BLOMFIELD, A.R.A., M.A., F.S.A., etc.

Sketched from life by our Special Artist.

Architectural Personalia. Mr. Alexander Graham resigned the office of hon. sec. of the R.I.B.A. after years of arduous and distinguished service. Sir Aston Webb was awarded a C.B. on the completion of the Victoria and Albert Museum. Mr. John Belcher was elected R.A. with Mr. Goscombe John the sculptor. Prof. S. D. Adshead was appointed to the newly-founded chair of Civic Design in Liverpool University. Dr. Arthur Evans was presented, in November, with the Royal Gold medal of the R.I.B.A. Two giants of the profession have died—on September 14th, Charles Follen McKim, of the great American firm of McKim, Mead, and White—and M. Auguste Choisy, who was chiefly known for his studies in architectural archæology. Each had received the R.I.B.A. gold medal. Portraits and biographies of both were given in our issue of September 29th.

In Parliament. In the Parliamentary Session of 1909, which was opened by the King in person on February 16th, the extraordinary Budget proposals overshadowed all other interests, and have undoubtedly had the very unfortunate effect of suspending building operations throughout the country, and this at a time when the industry had begun to hope for relief after a long period of depression. An absurd endeavour to tax clay as a mineral, which would have had the immediate result of crushing completely the already languishing industry of brickmaking, was happily abandoned in deference to vigorous representations by Mr. H. G. Montgomery, M.P., and in the Press, our own journal being by no means backward in opposing the ill-considered impost. The Housing and Town Planning Bill, reintroduced by Mr. John Burns, on April 5th, excited but little serious opposition in the House of Commons, and was passed by the House of Lords without serious mutilation. Several measures in which building interests were to some extent involved were carefully watched by the Employers' Parliamentary Committee—as, for instance, the Trade Boards Bill, and Mr. Churchill's Labour Exchanges Bill, which rapidly went through both Houses. The former was considerably modified in committee, and the building trades and other organised industries were, after influential representation, excluded from its operation. A Building Works Bill, introduced in March, was withdrawn in face of strong opposition from employers' organisations, and the Check-weighing Bill met with a similar fate.

Builders' Interests. Under the stimulating presidency of Mr. Ernest J. Brown, who happily unites an engaging geniality with splendid business capacity, the National Federation of Building Trade Employers has displayed extraordinary activity, and has done much to strengthen and improve its position and influence. It has held many important meetings—notably the half-yearly meeting at Portsmouth in the summer, and the Conference of Secretaries at Leeds in the autumn. The year has also been remarkable for the number of important questions that have been dealt with, such as the increasing employment of specialist contractors; the undue and ruinous delay of settlement for contracts; the imposition of inequitable conditions of contract; the non-supply of quantities for tendering; the unfair designation of the engineer or architect as arbitrator or referee in circumstances in which it is impossible to regard him as acting in a properly judicial capacity; the question of apprenticeship, and other matters, all of which have been taken up with vigour in the official journal. A large increase in membership is reported, partly as an effect of the inter-trading rule.

Architects of the Day.

IX.—Professor Reginald Blomfield, A.R.A.

When the history of contemporary architecture comes to be written, it will be recognised that to Professor Blomfield English architecture owes a very considerable debt, not only because he is one of our most erudite and scholarly architects, but also because he is one of the leaders of the higher education movement that has had such a beneficial effect upon our architectural schools and training. His appointment as Professor of Architecture at the Royal Academy was not only well deserved, but, apart from his undoubted merit for the post, was particularly fortunate. A professional capacity has been regarded as one rather of scholarship than accomplishment, but Mr. Blomfield brings to a wide knowledge of his art the invaluable experience of a large practice as a corrective of merely theoretical opinion. In addition to a keen analytical faculty he has the gifts of lucid exposition and literary expression which make his lectures a delight not only to his students but to that considerable public which is interested in the Art of Architecture.

Mr. Blomfield was born on December 20th, 1856, and is the third son of the late Revd. G. J. Blomfield, M.A., Rector and Rural Dean of Aldington, Kent. He was educated at Haileybury, and obtained an exhibition scholarship to Exeter College, Oxford, where he took a 2nd in Classical Mods., and a 1st in Classical Greats (1870). He played cricket for the Seniors during his College days, and cricket has always been one of his favourite recreations. It may be opportune, here, to correct a very frequent mistake by stating that he was articled to his uncle (not father), the late Sir Arthur Blomfield, for a term of three years. He also studied at the Royal Academy Schools, winning prizes of £10 and £25. Subsequently he travelled for some months in France, and he has, probably, a wider knowledge of French Renaissance work than any other English architect. Now that town-planning and civic design are so much to the fore, it may be

WYPHURST, CRANLEIGH, SURREY. REGINALD BLOMFIELD, A.R.A., ARCHITECT.

This house, recently completed, is a large extension and practical rebuilding of an older and much smaller house, seen on the extreme right, which, in turn, was an enlargement of a cottage. The wing on the extreme right has been converted into a private chapel.

of interest to mention that it was Mr. Blomfield who unearthed for English notice what is probably the first example of town-planning—the village of Richelieu, designed by Lemercier, as an adjunct to the great Cardinal's princely mansion, now destroyed, to house doubtless his numerous retinue. In spite of the vicissitudes of time and much unsympathetic treatment, the town is still so well preserved as to show the original scheme and architectural merit; and it is illustrated in the first "Town-Planning and Housing" Supplement of The Architectural Review next month (January, 1910).

Mr. Blomfield was a member of the Editorial Committee of The Architectural Review; was elected an A.R.A. in 1904, and appointed Professor of Architecture shortly after. He is also an Hon. Fellow of Exeter College, Oxford, a Fellow of the Society of Antiquaries, and a Fellow of the Royal Institute of British Architects, being elected a vice-president of the last-named body during the present year.

Since 1884, when Mr. Blomfield began to practice, he has designed a very large number of country houses and other words, of which it is impossible to mention more than a tithe here. But among his principal works are Apethorpe, Northants; Brocklesby Park, Lincolnshire, for the Earl of Yarborough; Boldre, Hants, for Mr. Herbert Alexander; Barwythe, for Mr. Ernest Alexander; new hall at Drakelowe, Derbyshire, for Sir Robert Gresley, Bart.; Elfordleigh, N.B., for Admiral Bainbridge; Caythorpe, Lincolnshire, for the late Mr. Edgar Lubbock; Cowley Place, Uxbridge, for Major A. Tylden Patterson; Chequers Court, Bucks, for Mr. Arthur Lee, M.P.; the Friars, Winchelsea, for Mr. George M. Freeman, K.C.; buildings at Haileybury College, and the South African War Memorial there; Heathfield Park, Surrey, for Mr. W. Alexander; Godinton, Kent, for Mr. Ashley Dodd; Gog Magog, Cambridgeshire, for Mr. Ernest Alexander; No. 6, Grosvenor Place, London, W., for Mr. George Albu; the Goldsmiths' College extensions, New Cross, S.E.; Saltcote Place, Rye, for Mr. R. Hennessey; Leasam, Rye, for Rear-Admiral Sir George Warrender, Bart.; No. 20, St. James's Street, S.W.; Knowlton, Kent, for Mr. Elmer Speed; Lady Margaret Hall, Oxford; Moundsmere, Hants, for Mr. Wilfred Buckley; Mystole, Kent, for the late Mr. W. Pomfret, M.P.; Mellerstam, N.B., for Col. Lord Binning; Murraythwaite, N.B., for Mr. W. Murray; The United University Club, London; alterations at the Oxford and Cambridge Club, London; Garnons, Hereford, for Sir John Cotterell, Bart.; Paul's Cross, St. Paul's Cathedral (now in course of erection); Portsea Parish Institute; Whitehall, Sandwich, and Hill Hall, Essex, for Mr. Charles Hunter; Sherborne School Buildings; Whitby School, Chichester; Wittington, Great Marlow, for Sir Hudson E. Kearley, Bart., M.P.; Wyphurst, Cranleigh, Surrey, for Sir Charles E. H. Chadwyck-Healey, K.C.B., K.C.; and Warehouse, Greycoat Place, for the Army and Navy Stores; London County and Westminster Bank, King's Road, Chelsea.

Of those we illustrate in this issue, Wyphurst, Cranleigh (p. 517), is a large extension and practical re-building of an older and much smaller house seen on the right in the view (p. 517). The older house was an enlargement of a cottage, and in the new buildings the house has been planned afresh with the exception of the old dining room. The old wing, seen on the extreme right, has been converted into a private chapel. To the west of the house an enclosed private garden with raised grass walks and water pieces has been formed.

The Warehouse, Greycoat Place, for the Army and Navy Stores (p. 518) is built on a site with a flat curved frontage formed by lines at a very obtuse angle with each other. The two ends are occupied by the main staircases, the centre eight bays on the ground floor are occupied with loading out stages at the front. The materials are

The materials are red stock brick and Portland stone dressings, with a base and columns of Cornish granite. The frontage is an irregular curve formed of lines at obtuse angles with each other.

red stock bricks for facings with Portland stone dressings and Cornish granite columns.

Whitehall, Sandwich (p. 519), is a golf box recently completed on the edge of the sea-shore between the Deal and Sandwich Golf-links. The walls are built with a hollow space, and "harled" or rough-casted on the outside, and the roofs are covered with Delahole slates.

Brocklesby Park (pp. 520, 521), was destroyed by fire in 1898, and rebuilt from Mr. Blomfield's designs during the three following years. The plan of the building was entirely re-arranged during the re-building, and large additions were made on the east and south sides, comprising a billiard room, dining-room, drawing-room, hall, library and principal staircase.

The South African War Memorial at Haileybury (p. 522), was erected to the memory of old Haileyburians who died in the war. It is a Portland stone obelisk, with bronze shields, swags, Cannon balls and cartouches. On the cartouches are the names of the sixteen battles of the war for which clasps were given. The winged heart is the school crest. On the shield facing the road is the inscription:—

> "HAILEYBURIENSIBUS IN AFRICA PRO PATRIA MORTUIS HAILEYBURIA FILIORUM MEMOR."

On the two sides are the words: "South Africa, 1899-1902," and on the shield facing up the avenue towards the school are the words:—

> "STA PUER, ET REVOCANS QUOS ABSTULIT AFRICA FRATRES. VIVERE PRO PATRIA DISCE MORIQUE TUA."

The obelisk stands on a pedestal 8ft. 9ins. high on six circular steps of Portland stone, enclosed by twelve stone posts with bronze collars and chains. The total height is 30ft.

Caythorpe, Lincolnshire (p. 523), was built for the late Mr. Edgar Lubbock, a governor of the Bank of England. The site selected was on the brow of a low hill on the north side of the valley that runs from Grantham to Lincoln, and here a large house was built of Ancaster stone, with bands of local ironstone. The stables, comprising stalls and four loose boxes, make a large building to the north-west of the house, and extensive lawns were formed on the hillside along three fronts of the house.

The United University Club, London (p. 524), is situated at the corner of Suffolk Street and Pall Mall East, and occupies the site of a former building. Considerable extra accommodation had to be given, and the plan had to be carefully considered to comply with this condition. The old club had a considerable area wasted by a grand staircase in the centre of the site. In the new plan the hall and staircase were placed at the north end of the building facing west down Suffolk Place. This arrangement also opens up the entrance to the Haymarket along Suffolk Place. The kitchen, offices and cellars are in the basement; on the ground floor are the entrance hall, main and back stairs, smoking-room, reading-room and lavatories; on the first floor are the club dining-room en suite, service room, lavatory, etc.; on the second floor, library, smoking, library, billiard-room, card-room, lavatories, etc.; on the third floor, billiard-room, card-room, three members' bedrooms, bath-rooms, lavatories, etc.; on the fourth floor, seven members' bedrooms, steward's room and boys' bed-room, bath-room, etc. A passenger lift runs to the third floor, and a double service lift to the fourth floor. There are also double service lifts from the basement to the service room on the first floor. The facades are entirely in Portland stone and the balconies, etc., are of wrought iron.

Amid the exigencies of a large practice, Mr. Blomfield has found time to exercise his literary gifts, and has published five books. "The Formal Garden in England" (1892), now in the 3rd edition; "A History of Renaissance Architecture in England," 1897, 2 vols., which is a leading work on this subject, and which he has abridged for the use of students, etc., in "A Shorter History of Renaissance in England," etc., published in 1900. "Studies in Architecture" (1906) and "The Mistress Art" (1908). During Mr. Blomfield's connection with "The Architectural Review," he contributed a number of papers to its columns, some of which have been included in his later books. Among these may be mentioned:—"The Architect of Newgate" (Oct., 1901), "The Italians at Fontainebleau" (Dec., 1902), from which we reproduce one of Mr. Blomfield's characteristic drawings, "Andrea Palladio" (April, 1903), "The French Primitives" (July, 1904), "Architecture and Painting" (Dec., 1904), "Philibert de l'Orme" (Feb. and March, 1904; January, 1905), and a critical note on "Greek" Thomson (May, 1904). He has also written for "The Nineteenth Century" and the quarterlies.

COPYRIGHT IN ARCHITECTURE.

One of the surprises of the year 1909 was the sudden prominence given to the question of architectural copyright. We have a note on the subject in another part of the present issue, but since that was written, the report of the Law of Copyright Committee has been published, and the portion of it which refers to architectural copyright may be usefully appended here. It is as follows:—

"With regard to architecture it is to be observed that in giving protection to actual works of architecture as opposed to plans made to guide the architect in his work, the Revised Convention goes beyond British law, which forbids copying plans of a building, but not copying the building itself.

"Plans and models appear to come under the head of 'literary and artistic works,' and as to them there has been no dissentient evidence given, nor any difference of opinion in the Committee.

"The evidence as to buildings themselves has been somewhat conflicting, but the Committee were much impressed by that of M. Maillard.

"It is clear that if the Revised Convention is to be followed with regard to works of architecture, the scope of British law must be enlarged.

"The Committee, by a large majority, have come to the conclusion, after due consideration of the evidence, that it is desirable to recommend that architecture be accepted as matter to be protected, both for the sake of uniformity and because it deserves to be protected and presents no difference in principle from that applicable to the sister arts.

"They further consider that protection should be given against copying buildings whether by use of plans or otherwise, and against use of drawings or models for other purposes than those authorized, and by other persons than those supplied therewith.

"With regard to the term 'architecture,' the Committee gather that the object of the article is to protect works of original and artistic character, and not works of common type which have been frequently produced on previous occasions.

"There may be difficulties as to remedies. Damages might not be technically provable, and destruction not permissible, as buildings are usually not the property of the infringer; but penalties might be awarded against any one who copies or is a party to copying."

The terms of the reference to the Committee were "To examine the various points in which the Revised International Copyright Convention signed at Berlin on November 13, 1908, is not in accordance with the law of the United Kingdom, including those points which are expressly left to the internal legislation of each country, and to consider in each case whether that law should be altered so as to enable his Majesty's Government to give effect to the revised Convention."

Euboeolith Patent Flooring, contractors to H.M. Government, 3, Victoria Street, Westminster, inform us that between 5,000 and 6,000 yards of their flooring has been laid in St. Mary's Hospital for Women and Children, Manchester—in fact, the whole of the flooring except that of the operating theatres.

Messrs. Joseph Robinson and Co., Ltd., Carlisle, alabaster proprietors, and manufacturers of plaster of Paris, Keene's, Parian, and Robinson's fireproof cement, etc., send for notice a pamphlet descriptive of their goods, and containing several illustrations of buildings at the Irish International Exhibition, in the construction of which their plaster was extensively used. As to the merits of the fireproof cement, many testimonials are given, including one from the late Sir E. Massey Shaw.

PICTURESQUE SCAFFOLDING.

By **A. G. H. Thatcher.**

In last year's special issue of this journal I was privileged to point out certain advantages (or disadvantages) that would accrue to a creative architect who could (or would dare to) embody in an architectural design some of the prominent features of scaffolding. I am not aware of any pressing desire to adopt the details of scaffolding as a motif for decoration. Where the artist has failed, the practical man has stepped in. To foretell the use of fumed oak in scaffolding certainly required a Christmas courage; but the reaction of the New Year did not prevent this fulfilment. For the erection of an extension to the premises of Messrs. Buchanan in Holborn, a gantry was erected in the nearest approach to brown oak that stain and water would give (Fig. 1). Its antiquity of appearance suggested that it might have been there from the middle ages, and it is said upon credible authority that the stranger in the town took it for the principal entrance to Staple Inn. Certainly, since the gantry has disappeared, Holborn has lost one of its principal attractions. Holborn, however, is not the only district that has been temporarily made beautiful by this means. Aristocratic Whitehall, and the otherwise prosaic Edgware Road, have also entered the lists. The erection of another Government building in Parliament Street afforded Messrs. Mowlem an opportunity for the display of artistic feeling, and the gantry built there has certainly added to their æsthetic reputation. (See Fig. 2.) Delicately tinted in blue and white, it set off the sombre grey of the neighbourhood with effect. But it has now gone the way of all gantries, and the building now stands naked and unashamed. Messrs. Allen, in the Edgware Road, have excelled themselves. (Fig. 3.) A pen and ink sketch of a scaffolding in Wardour Street, erected by Messrs. Dorey and Sons, is shown by Fig. 4. The design of the hoarding suggests the baronial castle, only a few portholes and a portcullis are required to complete the illusion. These examples seem to suggest the evolution of a new profession, that of scaffolding artist to builders. Some bold spirit may make a bid for it. He would deserve success, and (the Editors permitting) can be assured of my sympathy and respectful criticism next year.

MODERN AMERICAN ARCHITECTURE.

I.—General Sketch of its Rise and Progress.

INTRODUCTORY.

It is with keen pleasure that we present this copiously illustrated account of Modern American Architecture and of the men who have made it. American architects have always manifested a keen interest in British work; and if, hitherto, British architects have not adequately returned the compliment, the remissness is probably due to want of facilities. Never before has any attempt been made to place in the hands of British architects such a representative collection of examples of American work as that which is here produced; and we feel sure that it will be cordially welcomed as a substantial contribution towards the better understanding of a most interesting phase of the history of architecture.

The growing interest in American architecture was clearly manifested in the invitation to Mr. Francis S. Swales to deliver a lecture on the subject before the Royal Institute of British Architects. The compliment to American architecture was well deserved, and nobody is more competent than Mr. Swales to deal with the subject. He has done more than anyone else to promote a better understanding, in this country, of American work; and, in America, of British work; and to him the information on American architecture that has been collected in this special issue of the "Builders' Journal" is chiefly due. Mr. Swales's lecture, which was delivered before the R.I.B.A. in March last, attracted widespread attention, and still further stimulated the already strong desire to know more about American architects and architecture. It is in order to meet this demand that we have collected into handy form, from various sources, but more particularly from Mr. Swales's contributions to the "Architectural Review" and the "Builders' Journal," the matter and illustrations here given.

The lecture by Mr. Swales affords an admirable introduction to the subject, tracing the present-day developments to their beginnings in the United States when that country became a nation.

Pierre Charles L'Enfant.

Major Pierre Charles L'Enfant was one of the French colonists who lent their moral and material support to the American revolutionists during the War of Independence. He earned distinction as a military engineer; and when, as a result of the war, it became necessary to establish a "Federal town and a Federal House for Congress and for the executive officers, L'Enfant was commissioned to plan the city. Thomas Jefferson, the versatile Secretary of State, visited Europe, where he not only arranged diplomatic relations, but collected books, plans of buildings, and maps of cities. The maps, Mr. Swales conjectures, were obtained at the request of Major L'Enfant, to whom they were delivered. The maps selected were those of Paris, Orleans, Turin, Milan, Strasbourg, Carlsruhe, and Frankfort. Entrusted with an important scheme of town planning, he wisely sought the means of studying the best that had been done, and, with the aid of the maps and plans supplied to him, and probably with knowledge of the various works of Le Notre, L'Enfant evolved a plan for the city of Washington that was at once original, practical, and beautiful.

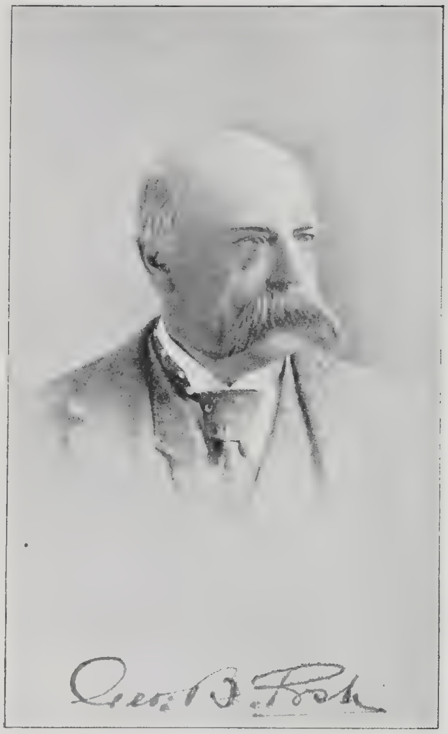
The City of Washington.

The beginnings of American national architecture, therefore, and perhaps the first considerable attempt at civic design, are to be found in the City of Washington. L'Enfant's plan provided for a central site for the Capitol—which was L'Enfant's designation of the Federal House—on the plateau at the intersection of two main avenues, running north and south, and east and west, and called respectively North, South, East and West Streets.

An Early Example of Civic Design.

The Capitol was situated in a large park from which radiated twelve wide avenues, including the four known as Capitol Street, and two of each of the others (those extending in opposite directions) were named after the States of Pennsylvania, Maryland, New Jersey, and Delaware. Other streets were then laid out parallel with the Capitol Streets, those extending north and south being designated by numbers, and those east and west by the letters of the alphabet. The President's house faced north and south in a park at the intersection of Pennsylvania Avenue and West Sixteenth Street. At the intersection of the principal axes of the Capitol and of the President's house it was proposed by L'Enfant to place the equestrian statue of Washington, voted by the Continental Congress of 1783; and from this point to the Capitol to develop the West Capitol Street into a magnificent avenue 400ft. wide and a mile in length, along each side of which, and situated each in the centre of its own grounds, were to be erected the "Grand Edifices," a "National Church," a kind of Pantheon for the reception of statues of heroes whom Congress might honour,

MR. DANIEL HUDSON BURNHAM.



Geo. B. Post

was mentioned in notes on early maps; and the engraved map of 1792 shows sites for buildings, monuments, and statuary, all arranged so as to present focal points along the principal streets, and, as L'Enfant says, "to reserve through the whole a reciprocity of sight" between the important points. Such was the plan approved by Washington and Jefferson, adopted by Congress in 1791, and entrusted to L'Enfant to carry out.

A special difficulty of town planning was at once encountered. All available land was bought up by speculators, who held it at exorbitant prices. Consequently, all that was done during L'Enfant's lifetime amounted to little more than the making of some of the principal roads.

Hallet, Thornton, Hadfield, and Latrobe.

In the year 1792 a competition was held with the object of obtaining a design for the Capitol; but of the sixteen designs submitted, not one was regarded as being fit for serious consideration. Afterwards, a New York architect of French extraction, Stephen Hallet, submitted a design which was approved; but immediately afterwards, a scheme submitted by Dr. William Thornton, a Philadelphia physician, who was an amateur of architecture, presented a design that greatly impressed Washington, who wanted to have it adopted instead of Hallet's. Then there arose a bitter controversy, Hallet declaring that Thornton, to whom the premium was awarded, had stolen some of his (Hallet's) rough sketches—a charge that was vigorously denied. Thornton, although he had studied in Paris, was not considered competent to superintend the work, and Hallet was made superintending architect. This did not end the quarrel. Hallet, showing that Thornton's plan was impracticable, was authorised to revise it. Thereupon Thornton got himself appointed one of the Commissioners. Hallet was then requested to hand over all his drawings to the Commissioners. He refused, and was dismissed. George Hadfield (an Englishman), who succeeded Hallet, was also badly treated and forced to resign. James Hoban, an Irishman, who had been clerk of works under Hallet, and who had won the competition for the design for the President's house, was next called in to continue the Capitol. He completed, in the year 1800, the north wing of the Hallet-Thornton design, which is now part of the central block. In 1803, Benjamin Latrobe, a pupil of Cockerell, was appointed to build the south wing and to rebuild the work upon the north wing that had been feebly executed under Hoban. Both wings were completed in 1811. The Capitol was destroyed by the British in 1814. Latrobe restored it, and designed the former House of Representatives, now known as Statuary Hall, and also the old Senate Chamber, which is now used as the Supreme Court of the United States.

Charles Bulfinch, of Boston.

When, in 1817, Latrobe resigned, the work on the Capitol was taken up by Charles Bulfinch, of Boston, who was the first American-born architect employed on the Capitol, and who designed the hall of the old Library of Congress, modified Latrobe's design for the dome, and designed the west front.

Latrope, whom Mr. Swales describes as an architect of incomplete training, had, like Jefferson, who, on retiring from Statecraft, practised architecture, much to do with the development of the so-called Classical Revival in America—the introduction of the use of Greek and Roman temples for buildings for all purposes. President Jackson appointed army engineers to construct Government buildings, and if a church was required, a Greek Ionic temple was presented; if a railway station, a Greek Doric temple was considered the correct thing.

Thomas Ustick Walter.

In 1850, when important extensions to the Capitol had become necessary, Thomas Ustick Walter, of Philadelphia, a Classicist, who used the orders with intelligence, refinement, and effect, planned and carried out the extensions and dome of the Capitol as seen to-day. When the American Institute of Architects was formed—patterned upon our Royal Institute—Thomas Ustick Walter was selected to be its first President. He was the last representative of American architecture as it was.

Richard Morris Hunt, R.I.B.A. Royal Medallist.

The architecture of the present in the United States may be said to have begun with Richard Morris Hunt, whom the Royal Institute honoured as the first American to which it awarded, in 1893, the royal gold medal. Hunt, when he returned to the United States in 1855, had been for ten years a student in the Ecole des Beaux Arts in the atelier of Hector Lefuel, and had worked under Lefuel and Visconti upon the construction of the extensions of the Louvre carried out during the Second Empire. He is accredited with the design of the Pavilion which faces the Rue de Rivoli, opposite the Palais Royal. Hunt was the son of a Congressman, and went directly into the office of Walter, working for him upon the Capitol for six months. He then returned to New York, where he found two or three architects endeavouring to resuscitate Gothic architecture by attempting to follow the so-called Gothic revival in England. Upjohn had

THE LATE CHARLES FOLLEN McKIM.

built Trinity Church with a great steeple, typifying religion dominating over New York—a stone exterior of pleasing design, fit to go with an old English vallage, and a vaulted interior—that is, "vaulted" in *plaster!* There were one or two other examples of this same sort of thing—a kind of old-world scenery, planted in little parks, amidst Greek temples serving as sub-treasury, hotel, and theatre. He set to work vigorously to change things. He started an atelier, in which he had as pupils Mr. George B. Post and Charles Gambrill, Professor Ware, and Henry Van Brunt. All of these pupils turned to the brand-new 'Gothic." Ware and Van Brunt practised together in Boston. Gambrill and Post, for a time, in New York.

Henry Hobson Richardson.

Upon the return to the United States, in 1870, of Henry Hobson Richardson, who had studied for several years in Paris, the firm of Gambrill and Richardson was formed; and in this office the late Stanford White worked as a draughtsman before he, too, went to Paris to study. Hunt had endeavoured to work in the *neo-Grec*, but seems to have found it an up-hill task, and, in spite of his best endeavours and his uncompromising contention against engineers designing architectural work, such buildings as the State War and Navy Department at Washington, the Capitol at Albany, and the Philadelphian city hall, went merrily on. Richardson returned after the war was over, and at the time that the country was being fairly inundated with Irish and Italian labourers, German mechanics, and fortune seekers and adventurers from all parts of the world, the administrative ability which America inherited from England was taxed to its utmost to preserve order and provide elementary education. Richardson almost immediately caught the rough, vigorous spirit of the times, and his Trinity Church at Boston, Court-house and Gaol at Pittsburgh, and Chamber of Commerce at Cincinnati, attracted the attention of the public to the difference between the work of the architect and that of the engineers and builders. Everybody wanted his building, whether a court-house or church, railway station or gate lodge, in "the Romanesque rock-faced style." Richardson's work extended all over the country. His design for the Cathedral at Albany was perhaps his greatest work, but the building, a commonplace Gothic structure, was not erected from his design. He died in 1886, and his influence upon the architecture of the country terminated when, in 1888, in the competition for the huge Cathedral of St. John the Divine, a Renaissance design by Messrs. Carrère and Hastings was placed first by the assessor over a number of the most original, impressive, and imaginative works that had been produced in Richardson's style, including the design in course of erection, a huge *tour de force* by Mr. William Halsey Wood, and the masterpiece of the period, the design submitted by one Buffington and made by the late Harvey Ellis.

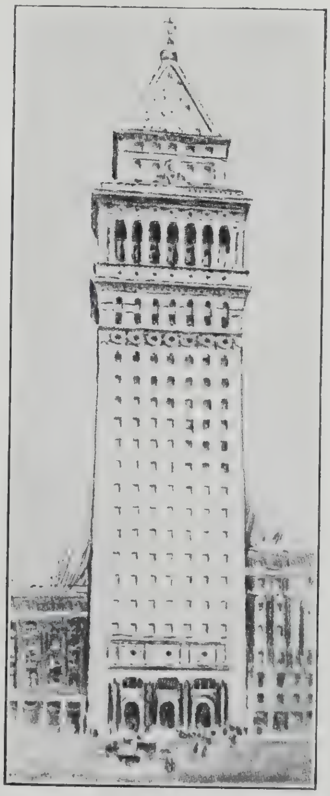
Hunt and Avery.

Hunt, who found his taste for classic work opposed by the wave of Gothic and "picturesque" popularity, had meantime compromised with the public by taking into association with himself Henry O. Avery, and together they produced the design for the William K. Vanderbilt house, Marquand house, and others in the French transitional styles of Francis I. and Louis XII. The Vanderbilt house was very successful. Henry P. Kirby, of New York, produced some fine imaginative studies in this style, which he published in his book of "Compositions." A number of strong men were won over to the style of the early French Renaissance, including Ellis, who produced some interesting work in St. Louis, among other things the City Hall; Bruce Price, of New York, who designed the Chateau Frontenac, an hotel for the Canadian Pacific Railway at Quebec; and Clarence Luce, of New York; Louis Hickman, of Philadelphia; Julius Schweinfurth and George Newton, of Boston, made studies of conspicuous merit, nearly all of which were produced between the years 1888 and 1892. In 1889 several works by Messrs. Carrère and Hastings were published, which had been built at St. Augustine, Florida, in the style of the Spanish Renaissance, but highly original and beautifully adapted to American needs, composed on lines of pure design and ornamented with paintings, mosaics, and decorative sculpture.

McKim, Mead, and White.

Messrs. McKim, Mead, and White produced several works in the Italian Renaissance style—the Villard houses and the Century Club; the Madison Square Garden (p. 601), with tower similar to the Giralda of Seville, and the New York "Herald" Building, by Stanford White. The publication of the early studies by Mr. McKim for the Boston Public Library, which clearly showed that it owed its inspiration to the Library of St. Genevieve, in Paris, had a very beneficent influence, and for several years was regarded by architects and the public generally as the finest example of architecture in the United States. Its extent and costliness indicated something of the demands for education of the citizens of Boston, and its conservative architecture is unquestionably only a reflection of the character of the representative people of that city.

The Columbian Exhibition afforded an opportunity, for the first time, of bringing together the combined artistic abilities of several of the then leading architects of the country. Again the best work owed its inspiration to French designs. From the time of this Exhibition down to the present day the history of the development of American architecture discloses a rapid march of progress. The Classic influence, re-established in the public favour by the Exhibition, has been maintained, and has been accepted in one or another of its manifestations throughout the country. Numerous architectural schools have been founded; and the old ones at the Cornell, the University of Illinois, and the Massachusetts Institute of Technology, improved their courses of instruction, modelled in principle upon that of the great school of Paris.



THE "SUN" OFFICE BUILDING.
BRUCE PRICE, ARCHITECT.

The Atelier System.

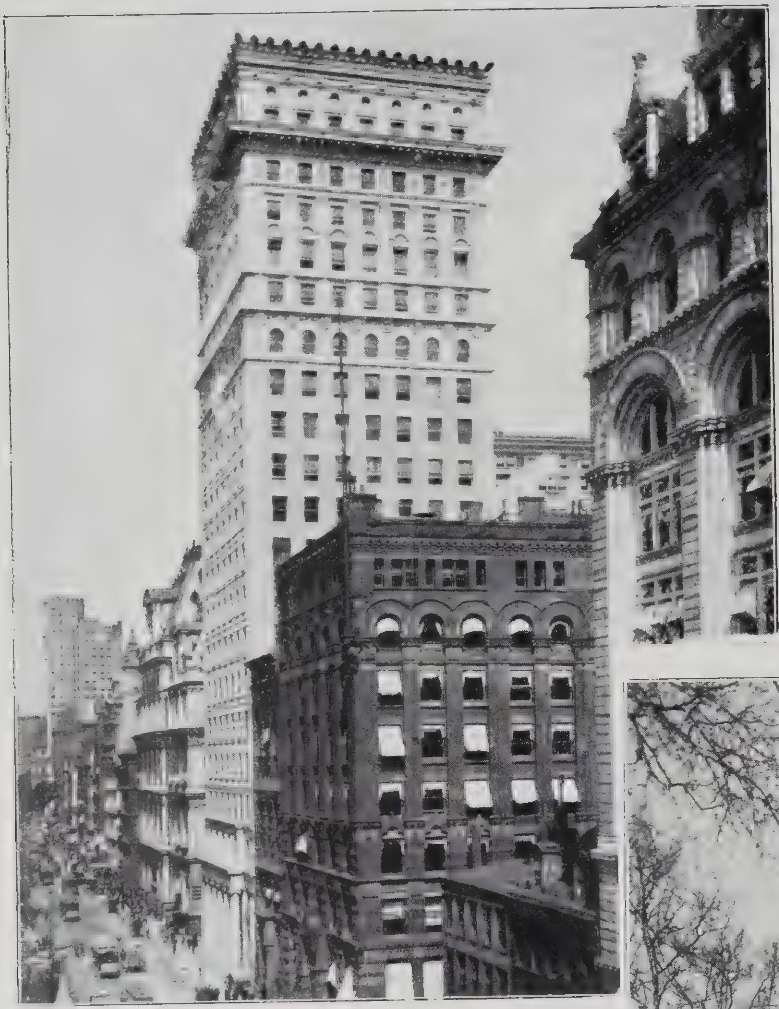
The atelier system, first attempted by Richard Hunt, was successfully inaugurated about fifteen years ago (by Mr. E. L. Masqueray, since Chief Architect of the St. Louis Exposition, who was at the time Hunt's chief assistant), and has been fostered by the Society of Beaux-Arts Architects, which has made its principal objective the education of the younger men; and by the Architectural League of America—a society composed of societies—whose members are the various architectural clubs, which, in several of the large cities do auxiliary work to that of the Society of Beaux-Arts Architects, especially as regards the education of those office-trained men whose circumstances prevent them from taking a regular course in one of the universities.

Some Notable Names.

It would, said Mr. Swales, be an almost Homeric catalogue that would attempt to include the works worthy of honourable mention which have been built since the time of the Columbian Exhibition. Among the leaders he mentions are: Daniel Burnham, the late Charles Follen McKim, George B. Post, John M. Carrère, Walter Cook, Thomas Hastings, Cass Gilbert, Whitney Warren, E. L. Masqueray, Henry Hombostel, Ernest Flagg, Louis H. Sullivan, and Peabody and Stearne, with fifty other "strong and brilliant men who have advanced the standard of design, and fifty more of the younger men whose work has already attracted attention." Their names are recorded in the "Journal" of April 14th, 1909, page 316.

Architectural Education.

The system of education, Mr. Swales observes, enables America to know who their strong men are while they are still young—a system that is competitive, the results of the competitions being made public. It is the French system—that of the Ecole des Beaux-Arts—where each student knows exactly the standing and record of every other student as well as his own in every subject. The entrance examinations are to the schools—not to the Institute. Before a student has spent much time or money, he knows whether it is likely to be worth his while to do so. Then the fellowship which arises out of friendly association with one another in the architectural clubs, the universities, and the ateliers in Paris, counts for much, and very much is due to the influence upon a large personal following of young men by such strong men as the late Charles McKim, John M. Carrère, George B. Post, Walter Cook, Cass Gilbert, and E. L. Masqueray; and of the college professors, Wm. R. Ware, A. D. F. Hamlin, D. Despradelles, Warren Powers, Laird, Fredk. M. Mann, Emil Lorch, Paul Cret, and others. More is owing still to the generous impulse of one of the present leaders who had a great opportunity to show his mettle and proved equal to the occasion. This



AMERICAN SURETY BUILDING, NEW YORK. BRUCE PRICE, ARCHITECT.

was the man who might have designed in his own offices all of the buildings at the Columbian Exposition, but chose rather to recommend the Exhibition Company to give out five of the largest buildings to his ablest contemporaries in his own town of Chicago, and five others to men practising in different parts of the country, whose loyalty to these co-workers was never found wanting, and whose integrity and ability—artistic, organising, and executive—proved him to be the fittest to lead, though he conceded himself that leadership to Richard Morris Hunt during his lifetime—Mr. Daniel Hudson Burnham, of Chicago, Chairman of the Senate Commission, which recommended to the Senate that the plan of the great L'Enfant should be adhered to.

Beginnings of American Architecture.

The architecture of North America is, as we have seen, not lacking in historical interest. Since architecture, properly speaking, did not appear there until about two hundred years ago, buildings did not begin to assume a distinctively American character until about the time of the Revolution; and, since that period, development, decline, change upon change, and one influence after another, have come and gone so rapidly that the buildings of the United States and Canada have acquired fresh characteristics almost as often as the countries have had a new Government. An adequate account of the rise and progress of American architecture would involve at least a sketch of the sociological, political, and commercial history of a country that has expanded with unexampled swiftness; and it is obvious that only the most salient outlines can be here given. In order to include what is of vital interest—what is characteristic of to-day—it is necessary to omit much interesting work showing the rise, zenith, and decline of a style, and much that illustrates abortive efforts to invent, revise, or introduce an effective style in place of Classic, which, in its various forms, appears to be the natural style of the Aryan race.

Foreign Influences.

Certain tendencies as to style in classifying the different kinds of buildings according to their uses, are observable; thus, the public buildings speak the classic tongues with the modern French, fifteenth-century Italian, or eighteenth-century English accent—the accent most pronounced and most frequent being the first. The Roman Catholic and Episcopalian (Anglican) churches are usually some form of Gothic; so also are many of the buildings of the Universities—as at Princeton (New Jersey), Bryn Mawr (Pennsylvania), Yale (New Haven, Connecticut), Washington (St. Louis, Missouri), and the College of the City of New York. In former cases it is the natural and traditional style, but for the colleges seems rather an effort merely to imitate the older ones of Oxford and Cambridge. There are, indeed, exceptions where even this Gothic style has been given a new lease of life in the new world. The clubs, as well as the hotels, are almost invariably Renaissance in style, as, indeed, are most of those in London's West End.

of the comparative wealth, social position, and sometimes also of the ancestry, of the people for whom it was designed—that is to say, the individual residence does; for there are in most of the eastern cities great rows of old houses that in some places are not unlike those of Bloomsbury, and that in others are more like those of Belgravia; while in still others they are unlike anything that ever was built anywhere at any time, or, let us hope, ever will be built again, and these are found in profusion in the west as well as east. One sees houses that may be compared with them in the terraced rows of suburban London—"Victorian" in style, brick in construction, stone of the "hand-carved" sort in "trimmings," suggesting only probable profit, at one time (since neighbourhoods rapidly decline), to the speculators who built them. In America, as elsewhere, there is a predominance of Renaissance as the style of architectural expression for the house—at least for the city house. In the country and smaller towns, the houses are free from any great influence of architectural precedents; but there is one thing written large upon the great majority of even the smallest and most insignificant of these dwellings, internally as well as externally—that is, the remarkable growth of good taste and refinement, and the manifestation of an extraordinary interest in architecture upon the part of the general public, which has taken place during the last two or three decades. This development is largely due to the influence exercised by the great expositions, and more directly perhaps to the extension of travel in Europe, and, further, to the founding of schools of architecture in connection with the Universities, which has gone on apace during the past twenty or thirty years. At the present time there are more than a dozen of these schools, affording excellent instruction, and architecture is becoming recognised as a study to be included in the "liberal" education of any man who pretends to scholarship. Not least, too, among the influences tending to improve taste and further interest in the study of the science of the beautiful in art and in the work of the artists of the day—in architecture, painting, sculpture, engraving—has been that of the illustrated press, the editors of which have shown a determination, not less wise than kind, to take the side of the artist and uphold him in the struggle against ignorance.

Influences Favourable to Art.

These influences, while their most apparent effect is seen in the design and furnishing of the residence, are reflected in all branches of architectural work. They have taken hold upon everything, from the seaside shack or bungalow, to the vast palaces of Newport and New York; from the lamp-post in the street, to the heroic monuments in the fine parks; from the diminutive village hall, to the great structures of the Government; from the small shingled chapel of the Free Methodist, to the inspiring cathedrals of the Anglican and Roman Catholic; from the country inn to the huge hotels of the large cities. The architects have even grappled with that most difficult of subjects for artistic treatment, the commercial structure, essaying to convert it to decency, and to convince its builders that something more than economy is necessary to their life. They have so far succeeded that whether it be the small shop or the office building two hundred feet square and ten or fifteen storeys high, or the thirty and forty storeyed towers recently completed, there is the same tendency to observe the canons of good taste and to develop a distinctively national character. Whether or not the building is devoid of architectural ornament, there is lavishness in detail, painting, and sculpture, there is in all of the recent work of architects—the word is here used in its proper sense: the master builder who builds beautifully—there is evident always an understanding of the fitness of things; a desire to fulfil and not to avoid or waive utilitarian requirements, and an apparent healthy desire to eliminate what is superfluous; so that the solution is scholarly, simple, direct, beautiful.

II.—Some Makers of Modern American Architecture.

MR. GEO. B. POST, OF NEW YORK.

George Browne Post was born December 15th, 1837, educated as an engineer in the University of the City of New York, and graduated in 1858. It was in that year that the late Richard Morris Hunt first opened his atelier for students, and Post entered this school at the same time with the late Charles D. Gambrill, who was first his partner, and afterwards the partner of Henry Hobson Richardson. In the year 1861 the Anti-Slavery War took Mr. Post away from his practice, and kept him for some years in the service of his country. This dissolved the firm of Gambrill and Post. The war over, Mr. Post returned to the practice of architecture, and began to come into prominence as the architect of large and important buildings about the year 1875; and during

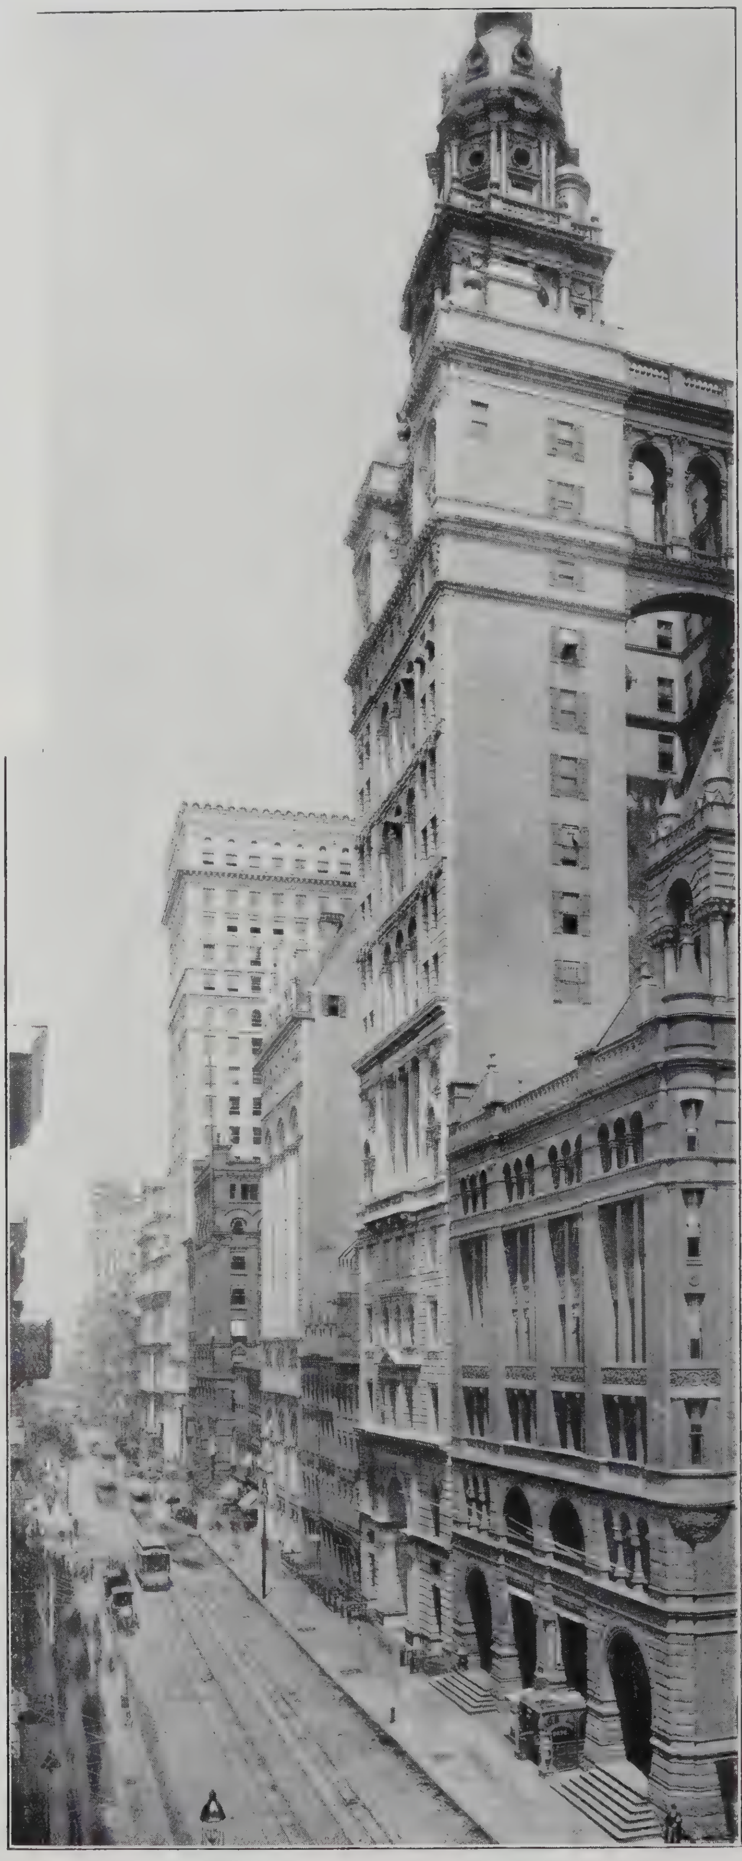
the years that have elapsed since then, his business has been one of the largest in the United States.

This business is, moreover, distinguished by the importance from a social and commercial point of view, and by the high cost of many of the buildings, as well as their extremely thorough and workmanlike construction. Many American cities have, among their most important public and mercantile buildings, the structures erected from Post's designs, and several of the most sumptuous and splendid residences in America are also his work. These buildings are appropriate and enduring, useful and worthy, and, as instanced by his late works, are not without conspicuous artistic merit. Of his earlier work, the late Russell Sturgis wrote: "That charm of conventional proportion which, in our modern practice, can only be got by the deliberate sacrifice of convenience and logic to the massing of lines of a façade, is not especially a characteristic of his compositions. On the other hand, these buildings are admitted by all to be among the best built, best planned, most useful and most truly economical of our modern structures. It is, moreover, generally admitted that this architect, more than most men in very large practice, designs his own work. Of course, the mysteries of a working office are impenetrable. No one really knows which member of the firm, or which subordinate of the many in an office of seventy or eighty employees, is really responsible for the merit or demerit of a design. We call a building the design of Smith or Brown, because Smith or Brown is the responsible man; it is he who has received the commission and who draws the percentage; but who deserves the credit or discredit of the plan, the general design, or the details, is absolutely unknown to the outside world. And yet it is not to be doubted that the architect whose work we are now considering does far more of his own original planning and designing—arranges his own studies far more thoroughly and in person—than is at all the rule. It is not many months since Mr. Post said, himself, in the course of discussion at the Architectural League, that the limit of business in his office was that of his own capacity to originate the designs—to make primary studies—and it is probable that no one of those present was inclined to dispute this saying, rash as it seems, and almost incredible, if measured by the well-known practice of many architects in a large way of business."

Since Mr. Sturgis wrote the above paragraph, Mr. Post has taken into partnership his two sons, Mr. William S. Post and Mr. James Otis Post, whose modern and more thoroughly artistic training has doubtless assisted greatly in the continuous improvement which has constantly been observed in Mr. Post's work since the earliest examples began to attract the attention of the American architectural profession.

To use the words "continuous improvement" might possibly suggest the idea of "damning by faint praise," and if we were to consider the earliest of Mr. George Post's work as representing in the least his present understanding of architecture, or that his work to-day were merely "improvement" over that of the period of time between the closing of the war and the opening of the Columbian Exposition, the idea might not improperly be suggested. Such, however, is far from being the fact. In few recorded instances has the existence of latent talent been so clearly proved as in Mr. Post, by his works since the days when, through association with a number of brilliant artists, his own artistic instincts were awakened.

Mr. Post's work may be classified into four principal divisions as to time and style: first, his "engineering" period, when he produced the very large, important, and altogether hideous Pulitzer building, Park Row, New York, and one or two others equally unlovely; secondly,



VIEW UP BROADWAY, NEW YORK. MANHATTAN LIFE BUILDING IN FOREGROUND.

his experimental period, when he became more interested in the beautiful side of his work and presented the Produce Exchange Building, at Bowling Green, the old "Times" building in Park Row, the Union Trust Building in Broadway, New York, the first Prudential Building at Newark, N.J., and the building of the Erie County Savings Bank at Buffalo, N.Y.; thirdly, his period of development, when he produced the Cornelius Vanderbilt town house—probably to-day the largest in New York, the Liberal Arts Building at the Columbian Exposition, the Bank of Pittsburgh, and the Park Building at Pittsburgh, Pa., and the Huntington residence in Fifth Avenue, New York; and fourthly, his period of achievement, which may be

(For Elevation, see page 540.)

said to have begun with the strong design which won the competition for the building for the Department of Justice at Washington, D.C., about ten years ago.

Of the earliest of these stages of his work, all that should be said in fairness is, that it was much better in construction, and a little better in design, than what was being done by other architects at the time—a time when architecture had almost ceased to exist in all countries boasting "Western civilisation." It was not *architecture* in the sense in which we use the word to-day; it was only good building, which grew simpler, and consequently better, as years went on. In the Produce Exchange there is a hall of great dimensions, which is wonderfully effective because of its good proportions and its simplicity of scheme. This Produce Exchange Building, and all the vigorous designs mentioned as belonging to his experimental period, show the influence of the work of Richardson, but more than this, they reflect truly the life and spirit of the times.

It may be said that the architects of the Columbian Exposition educated themselves at that exposition, since it is a fact that several of those who took part in the work upon that famous design had never done anything else comparable with what they did there. Mr. Post was one of the members of the Board of Architects, and architect of the Palace of the Liberal Arts—from a general point of view, perhaps the finest exposition building that has ever been built.

For several years following the exposition, Mr. Post's work was almost exclusively the commercial class—the gigantic office building being his portion—and with this class of work he kept busy a large number of draughtsmen. But enthusiasm on the artistic side of his profession had been much developed by his experience upon the work at Chicago. Association with such artists as Hunt, McKim, Burnham, Atwood, and Saint Gaudens, had aroused his deep interest in the arts, and especially in monumental architecture, of which his first remarkable study was the successful competitive design for the Department of Justice at Washington—above mentioned. This Department of Justice design is a scholarly study in architecture, at once classic, modern, and distinctively American. Several of Mr. Post's buildings are illustrated on pages 546, 552, 561, 589, 595, 602, and 603.

Mr. D. H. BURNHAM, OF CHICAGO.

Daniel Hudson Burnham, probably now the foremost of American architects, was born at Henderson, Jefferson County, New York, September 4th, 1846. He is a grandson of Samuel Hopkins, of Vermont, who made himself famous in the war for American Independence. In the year 1855 his family moved to Chicago, which was then a mere border town of a few thousand inhabitants. In the year 1864 he commenced his architectural studies in Massachusetts; and in 1867 returned to Chicago and entered the office of Messrs. Loring and Jenney, where he received his first eighteen months' professional experience. In October, 1871, he was engaged by Messrs. Coster, Drake, and Wright, in the rebuilding of the city which followed the great fire. Those were not days of monumental city planning, and the refinements of life are not the first things to be thought about after a great catastrophe. The buildings first erected were only a stage in advance of those which had been just burned down—the advance was in engineering rather than architecture; the buildings were better designed as regards construction, and perhaps also as to means of escape in case of fire, but it was not until some years later—one might say at least not until after the Centennial Exposition of 1876, held at Philadelphia—that the idea of building beautifully—for effect as well as strength—took hold of the people of Chicago.

In 1873 Mr. Burnham and John Wellborn Root commenced the practice of architecture under the firm name of Burn

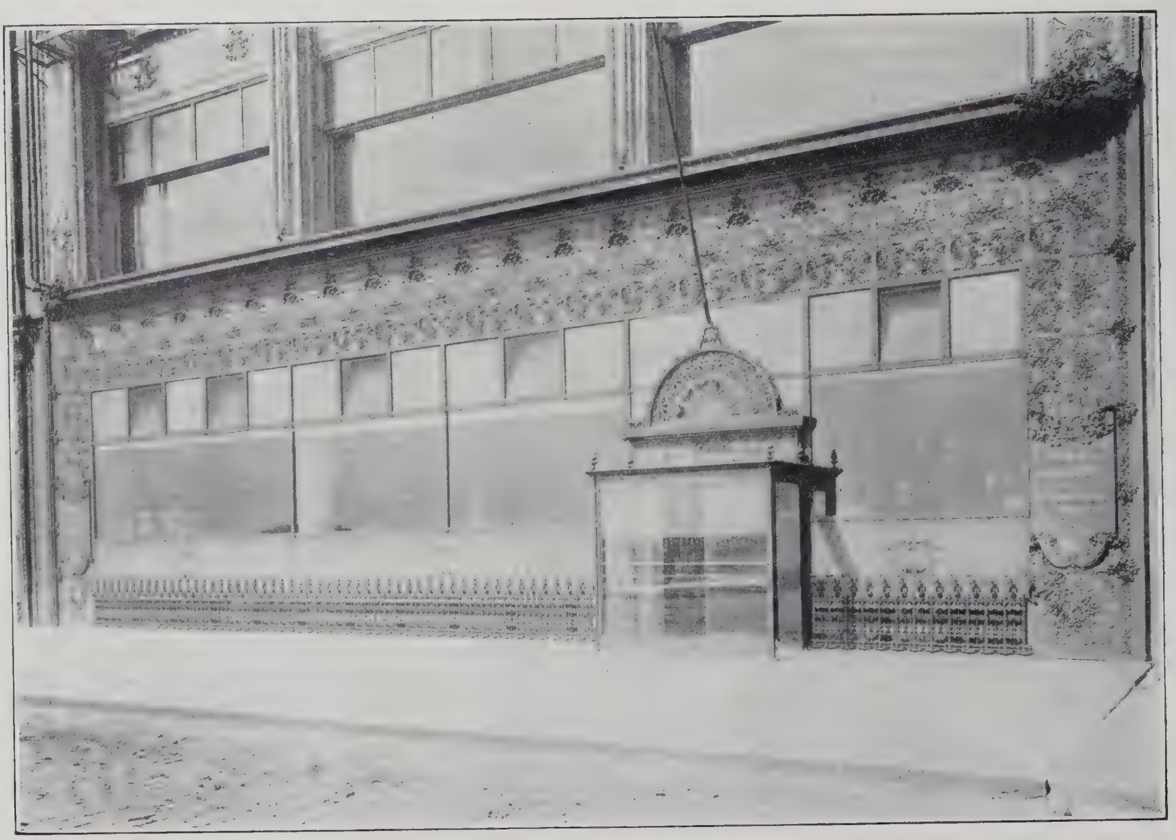
(For Detail, see page 538.)

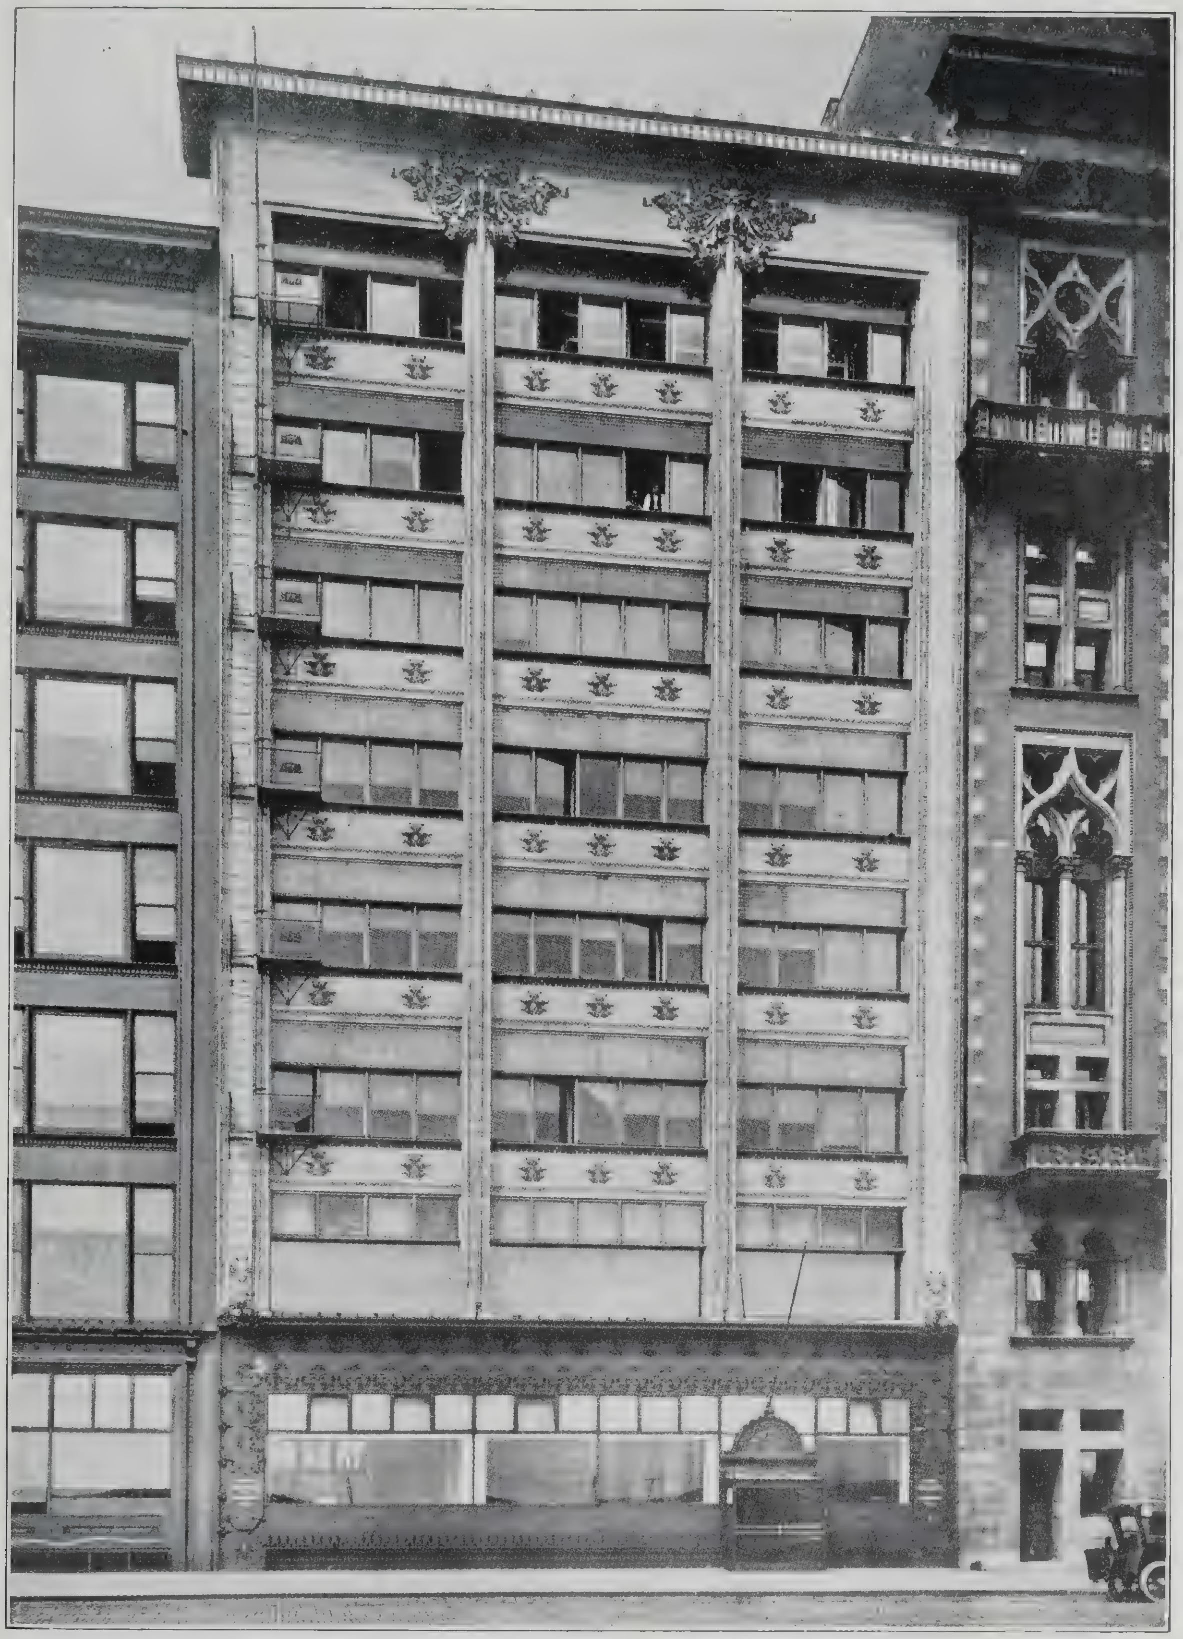
ham and Root. An examination of their very early work reveals only undeveloped—but developing artistic ability, and their later work, such as the "Chicago Herald" building and the Monadonock office building, the twenty-storey Masonic Temple, and the building of the Women's Christian Temperance Union, all of which designs were well in advance of what was being done by their contemporaries, though proving artistic perception in their designers, were all expressed through the medium of a style little suited to the orderly and rather Latin taste of Mr. Burnham. The Monadonock, though a plain commercial structure—absolutely unornamented—attracted much attention on the part of the public and "the profession" alike, because of its good proportions and excellent lines, and may be said to be the first evidence of classic taste in the design of office building structures.

The earliest architectural development of Chicago is centred in the work of these two men.

The beginnings of modern American architecture may be said to have taken place when in September, 1890, Messrs. Burnham and Root were appointed "constructing architects of the Columbian Exposition," and a month later Mr. Burnham was made Chief of Construction. The following January Mr. Root, who had been studying the design while Mr. Burnham was busy organising the construction department, died, and Mr. Burnham was appointed Director of Works, with sole responsibility for the artistic and practical result of the whole work connected with the buildings and grounds. It was due principally, if not entirely, to his efforts during the period of inception, that the arrangement was made to place a Board of Architects in control of the scheme and assign the separate buildings to different architects. This Board of Architects included most of



SHOP-FRONT, GAGE BUILDING CHICAGO. LOUIS H. SULLIVAN, ARCHITECT.



GAGE BUILDING, CHICAGO. LOUIS H. SULLIVAN, ARCHITECT.

the conspicuous artistic talent of the day—two of its members, the late Richard Morris Hunt and the late Charles Follen McKim, were the only Americans who have ever been presented the Royal Gold Medal of the R.I.B.A.—McKim, with his partners Mead and White, Messrs. Peabody and Stearns, the late Dankmar Adler and Mr. Louis Sullivan, Mr. Geo. B. Post, the late Henry Van Brunt, and Mr. Howe, the late W. L. B. Jenney, Mr. Solon S. Beman and the late Charles Bowler Atwood. The last-mentioned was chosen by Mr. Burnham to become his chief assistant, and later taken into partnership. Mr. Ernest Graham, another assistant renowned for executive ability, was made Assistant Director of Works, and afterwards a partner. In thus drawing about him the ablest and most influential members of his own profession, and putting in their hands the check upon his own ideas and undertakings, Mr. Burnham displayed a diplomatic skill for which he has always since been distinguished—not only among architects, but when dealing with the great "captains of industry," "masters of finance," "railway magnates," and able politicians with whom he has been in constant contact since the days when the Exposition was first projected. To an acquaintance he was once described, by a late United States Senator, as "a great artist, a great engineer, a great organiser, and a great diplomat." When this was repeated to an engineer who had worked with Mr. Burnham during the Exposition days, the reply was even more pleasantly interesting: "He has a cold head and a warm heart, which never mix, but are always in touch with each other. In meeting him I always felt a thin sheet of ice was between us, but a generous man on the other side." These are the sort of things one sometimes hears said of a prominent man after his demise—and then usually by his personal friends—but the above comments were made by men who knew Mr. Burnham in business only, to another who they knew had at that time met him but once.

The reason the better characteristics of prominent men are not more frequently mentioned—except, of course, during after-dinner speeches—is doubtless due to fear on the part of their acquaintances of hurting the susceptibilities of the subject. But when that subject is separated from the writer by a distance of about one-quarter round the world, one may put it in its true perspective with sufficient propriety.

The Columbian Exposition brought together not only the best architects, but also sculptors, painters, engineers, "landscape architects," and workers from all over the United States. Perhaps no other Exposition anywhere ever aroused such widespread interest, such sectional pride, or such local enthusiasm. This was a monument to commemorate the four-hundredth anniversary of the discovery of America, a memorial to the peaceful progress of the American people, a milestone marking the course of development of the great "Middle West," the "Coming-out reception of Chicago."

One of the most disastrous conflagrations of modern times had swept the city of Chicago out of all but existence only twenty-one years before, and its rebuilding had gone on amidst national financial panic, wild struggles with a semi-organised and desperate anarchy, which was insidiously sapping the mind and energy of local labour, and in the face of lack of faith in its enterprises on the part of investors in the Eastern States. Chicago was spoken of as the "city of slaughter-houses," of "pork packers," "the city of magnificent prairies"—alluding to the numerous spaces unbuilt upon—and otherwise generally slurred. But in 1893, when the Columbian Exposition was thrown open to the world, everybody who could journeyed thither, and the real Chicago began to be known. Her enterprise, her ambition—to be larger than

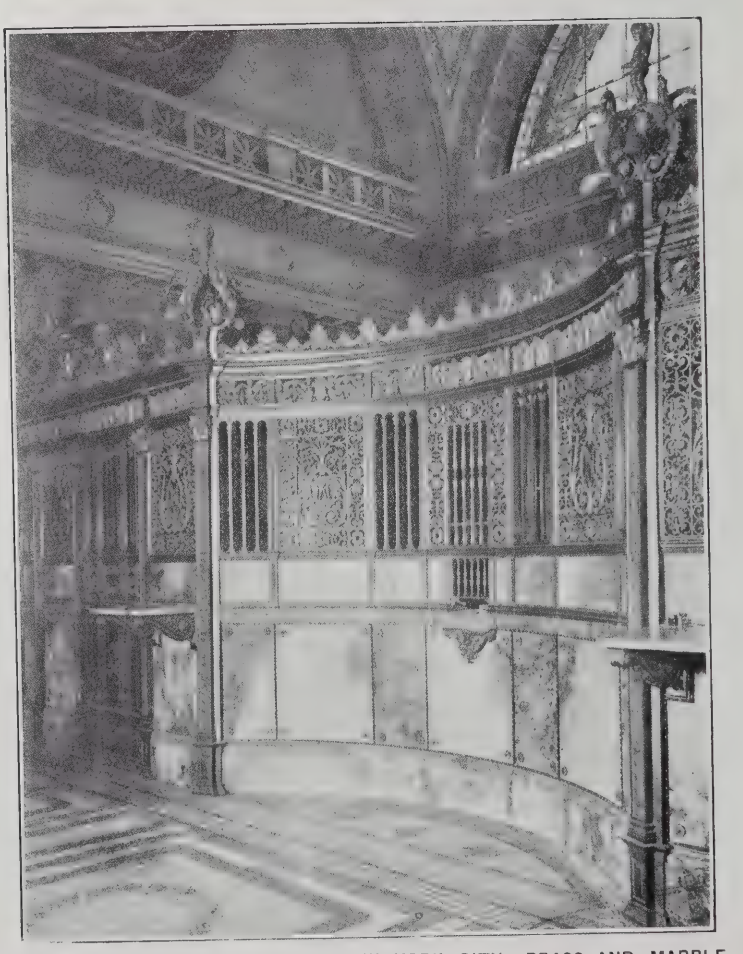
London and more beautiful than Paris—her great optimism and her financial solidity, became subjects of world-wide discussion. And to-day in Europe, whenever Chicago is mentioned, the great "World's Fair" becomes a topic of conversation. The immediate influence which the Exposition had upon the architecture of the country is too well known to require more than mention of it here. As the mainspring—we might say—of the effects produced by that Exposition, the name of Burnham is permanently associated with it—with one of the greatest architectural achievements of modern times. It is worthy of note that aside from his mere honorarium, which did not refund his expenses, the Director of Works did not profit financially from any work connected with the Exposition, but devoted his time to the undertaking, as though he had been a paid servant of the Exposition Company. When the buildings of the Exposition were completed, a public dinner was tendered to the chief architect in New York, given directly to the man whose genius had been the guiding force, and as a grateful recognition of his services. At this dinner were gathered as hosts a notable company of men highest in all the arts. On no occasion previously had a member of the artistic profession been so honoured, publicly, in the United States.

Harvard University recognised the importance of his labours by conferring upon him the honorary degree of Ph.D. The following year he was elected President of the American Institute of Architects, and was re-elected in 1895, and following his second term was elected a Director of the Institute for three years.



MANHATTAN LIFE BUILDING, BROADWAY, NEW YORK CITY. BRASS AND MARBLE SCREEN. KIMBALL, THOMPSON, AND MACKINTOSH. ARCHITECTS.

The Exposition over, Mr. Burnham returned to his large private practice, already one of America's most distinguished architects. But still greater tasks to perform for his profession and his country awaited him in the not distant future. For a few years continuously, and more or less ever since, he has been obliged to devote himself principally to conducting the architectural work of such commercial undertakings as the Ellicott Square Buildings, Buffalo, N.Y., Fisher Building and Great Northern Hotel annex in Chicago, Youngstown (Ohio) Bank, the Illinois Trust Company's Building, Chicago (p. 564), the Pennsylvania Railroad Station at Columbus, Ohio, the Marshall Field Retail Stores, the Land Title and Trust Company's buildings at Philadelphia, the Majestic Building at Detroit, the Traction Building at Cincinnati, the Union Trust Building at Pittsburg, the Continental Building at Baltimore, the Mills Building at San Francisco, the "Flat Iron" Building, New York (p. 533), the Frick Building and the Pennsylvania Railroad Station at Pittsburg (p. 544), the first National Bank of Chicago, Keith's Theatre and the Wanamaker Stores at Philadelphia, the Real Estate Exchange, Chicago, the Wanamaker Store at New York, the Ford Building at Detroit, the Commercial National Bank at Chicago (p. 559), the First National Bank of Pittsburg (p. 563), the People's Gas Company Building at Chicago (p. 578), and Gimbel Brothers' Store in New York City, the two latter being at present in course of construction. His first columnar design for the Selfridge Building in Oxford Street was perhaps the finest design that has yet been made for a commercial structure, and a subsequent re-study—made after a re-study of the original design had been made by another architect in London—was shown two years

ago at the Royal Academy by means of a large beautifully rendered water-colour drawn by Mr. Lawrence Buck, of Chicago (p. 579). This has been somewhat modified in execution.

It is probable, however, that with the exception of the bank buildings solely devoted to banking, none of these great commercial structures appeal very strongly to Mr. Burnham's æsthetic sense. His great design for the Field Columbian Museum at Chicago seems to be more to his feeling for architecture. It may be classed with the New York and Boston Public Libraries among the very best of American architectural productions. Another work almost as fine and equally important is the great Union Station at Washington, D.C., which arose out of Mr. Burnham's action as a patriotic American citizen in asking a railroad company to give up certain of its rights in the interests of the beauty of the nation's capital, in the planning of which Mr. Burnham has taken part second only to Major L'Enfant, who made the original plan.

Plan of Washington.

In March, 1901, the Senate of the United States "Resolved that the Committee on he District of Columbia be, and it is hereby, directed to consider the subject and report to the Senate plans for the development and improvement of the entire park system of the District of Columbia. For the purpose of preparing such plans, the Committee may sit during recess of Congress, and may secure the services of such experts as may be found necessary for a proper consideration of the subject," etc.

About a fortnight later the sub-committee having the matter in charge met the representatives of the American Institute of Architects, and agreed to the proposition of the latter that Mr. Burnham and Mr. F. L. Olmstead, jun., be employed as experts, with power to add to their number. These gentlemen accepted the task, and subsequently invited Mr. McKim and Augustus St. Gaudens to act with them. Mr. Burnham was elected Chairman of this Expert Committee.

At the call of their professional brethren, and at the request of this committee, these men virtually put aside their large and profitable private work, and for nearly a year devoted their time, their experience, and their technical training to the service of the nation. These sacrifices were made without pecuniary reward, and at a time when success and fame were already secure.

The work done by this committee resulted in the adoption of a plan following closely the original plan made by Major Pierre Charles L'Enfant in 1791, its object being to prepare for the City of Washington such a plan as should enable future development to proceed along the lines originally planned—namely, the treatment of the city as a work of civic art—and to develop the outlying parks as portions of a single well-considered system.

After detailed examination of the topographical features of the District of Columbia, the Commission drew up preliminary plans. They were then forced to the conclusion that an adequate treatment of the park system depended upon the exclusion of the Baltimore and Potomac Railroad from public grounds, so as to allow that dignified approach to the Capitol for which the Mall was originally designed. The occupation of the Mall by the railroad dated back to 1872, when it was granted by the then local government of the District of Columbia and confirmed by Congress. The railroad therefore held the right to use the property by a title good in law and equity, and by virtue of a later Act of Congress the railroad space had been enlarged in consideration of the surrender of street trackage and the proposed elevation of tracks in the City of Washington.

Mr. Burnham was architect of the Pennsylvania Railroad's new station at Pittsburg, and he had also drawn for the Pennsylvania Railroad the preliminary plans for the then proposed new Baltimore and Potomac station in the Mall site. He went to the President of the Pennsylvania and asked that the station be built on the south side of the Mall and lands adjoining. The architectural and other advantages of the proposed site were set forth with such vigour as to command serious consideration.

During the summer (1901), Mr. Burnham, with other members of the Commission, made a brief trip to Europe, and while here—in London—President Cassatt, of the Pennsylvania, announced to him his willingness to consider the question, not of moving the station to the south side of the Mall, but of withdrawing altogether from that region and uniting with the Baltimore and Ohio Railroad Company in the erection of a Union Station, provided suitable legislation were secured to make compensation for the increased expense such a change would involve, and provided also that the approaches to the new site be made worthy of the building the railroads proposed to erect.

The Commission proposed a site on Massachusetts Avenue, which was finally accepted by the railroad companies. Mr. Burnham was charged with the designing of the new station, which was intended to be superior to any structure ever erected for railway purposes.

It is seldom, even in these days of town planning—or talk of it!—that an architect charged with the planning of a city, but to have planned two or three capital cities surely must be a record. Such, however, has fallen to the lot of Mr. D. H. Burnham.

The Plan of Manila, Philippine Islands.

In 1898 differences between the United States and Spain resulted in the acquisition of the Philippine Islands by the former. No sooner had these islands come into the possession of the United States than the War Department set about adapting the capital city of Manila to the changed conditions brought about by the influx of Americans who are accustomed to better conditions of living than had prevailed in the Philippines. In 1905, Mr. Burnham, assisted by Mr. Pierce Anderson, was instructed by the Secretary of War (the Honourable William H. Taft, since President of United States) to visit the city of Manila and prepare a report and plans for the future improvement of the city and harbour. The report was completed on June 28th, 1905. It deals briefly with the history and general conditions prevailing, political, topographical, building, and population. It was accompanied by two plans—the plan of Manila, showing proposed improvements, and plan of Manila Bay, showing a proposed sea boulevard.

The aim of the proposed plan is stated to provide :—

(1) Development of water front and location of parks and parkways, so as to give proper means of recreation to every quarter of the city.

(2) The street system, securing direct and easy communication from every part of the city to every other part.

(3) Location of building sites for various activities.

(4) Development of waterways for transportation.

(5) Summer resorts.

The proposed development of the water front includes the construction of an ocean boulevard or continuous parkway along the bay to the south side of the city; planted drives along the shores of the river, which runs, approximately, east and west, and divides the city into halves; a new Luneta—or island pleasure park—formed upon made ground in the shallow part of the harbour, parks, parkways, playgrounds, gardens, and fountains.

The street system deals with the sanitation of the old quarter, and attempts to connect it with the ideal plan proposed for the future extension of the city, that the existing streets, bridges, and harbour works may be left substantially unchanged, and no demolition of buildings or changes in the direction of streets are suggested, except such as were imperatively called for to relieve present congestion and provide for the future needs of traffic. It also considers carefully the advantages and disadvantages connected with the old city walls, and recommends their retention, suggesting the cutting of arches through same to allow the extension of streets. It also proposes that the old moat shall be filled in, and treats scientifically the problem of the width of streets. Of the street system in the new quarter, it provides :

Avoidance of either north or south or east and west orientation of building sites.

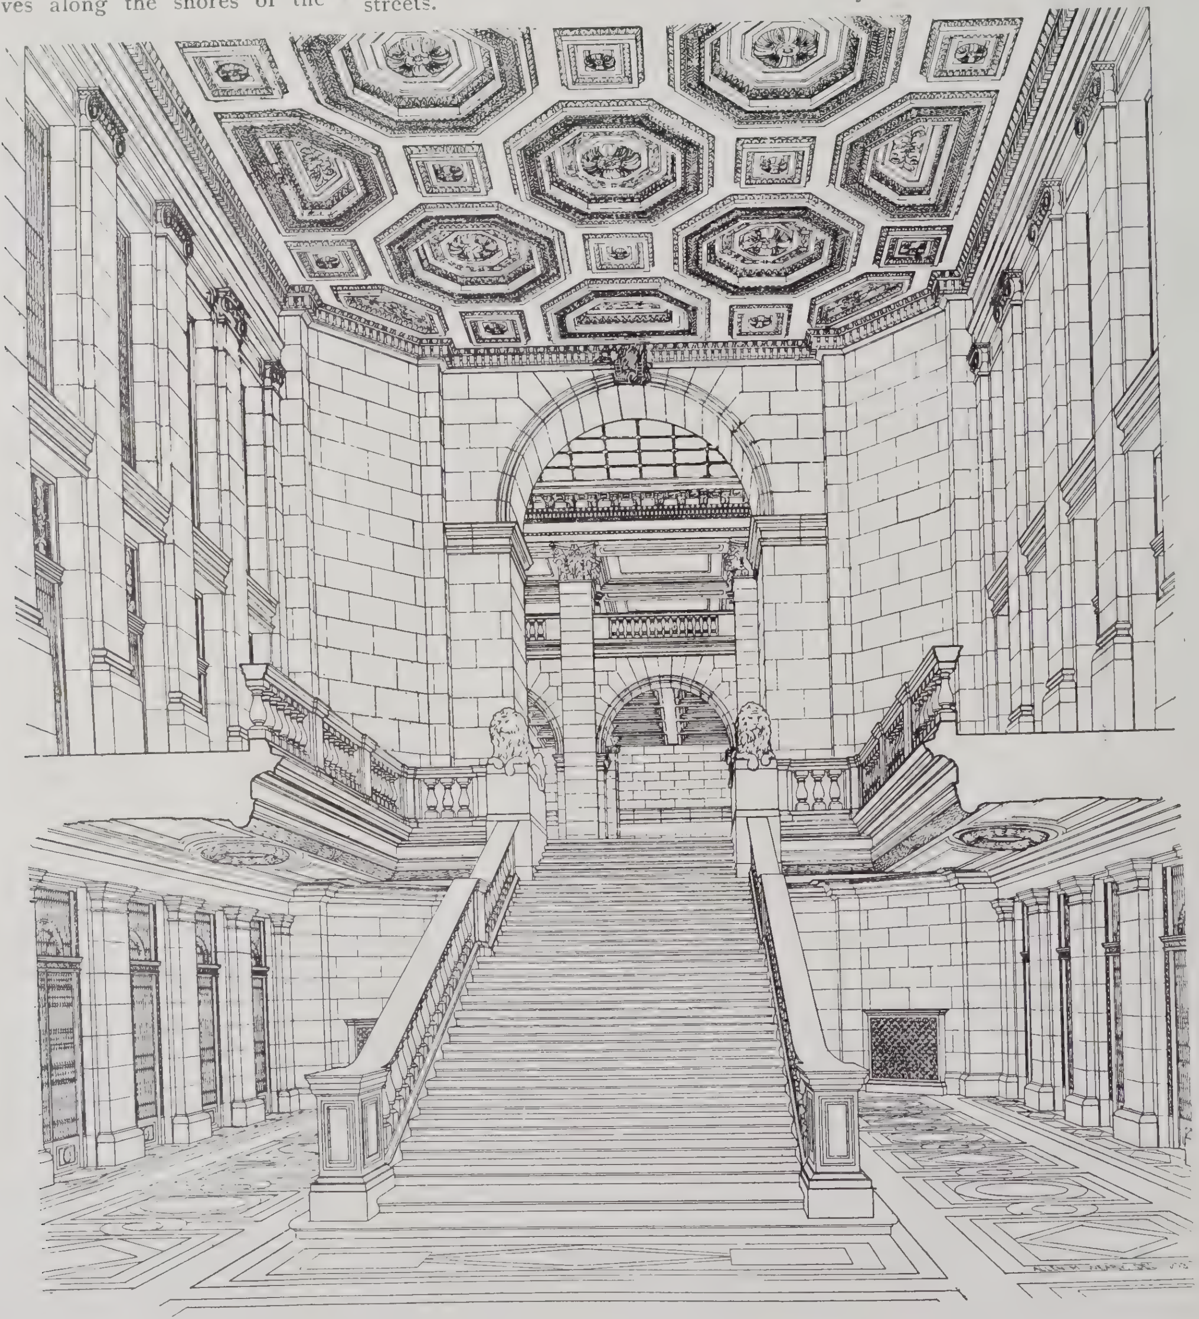
Fan-shaped grouping of radiating streets.

Diagonal arteries allowing direct communication from any city district to any other.

The avoiding of north and south, or east and west orientation of streets allows each of the four sides of the house to have the advantage of direct sunlight at some time during the day, with consequent gain in ventilation and sanitation.

The location of building sites for various activities is discussed in the report in groups consisting of the Government or National group, the Court House or Halls of Justice, the group comprising the Library, Museum, and Exposition buildings (which might be termed the group of Public Instruction), the Post Office, the Railway Station and approaches, the Municipal group, the official residences, the hotels, the Casino, public baths, and boat clubs (public recreation), the school centres, and the charitable institutions. The Development of Water Transportation considers additional harbour facilities, *esteros*—narrow canals—ramifying throughout Manila, and the establishment of open quays along the riverside.

The climate of Manila made it necessary to give special consideration to the subject of establishing accessible summer re-



STAIRCASE, FIRST NATIONAL BANK BUILDING, CHICAGO. D. H. BURNHAM AND CO., ARCHITECTS.

sorts on high ground, and led to the interesting study of the suburban districts.

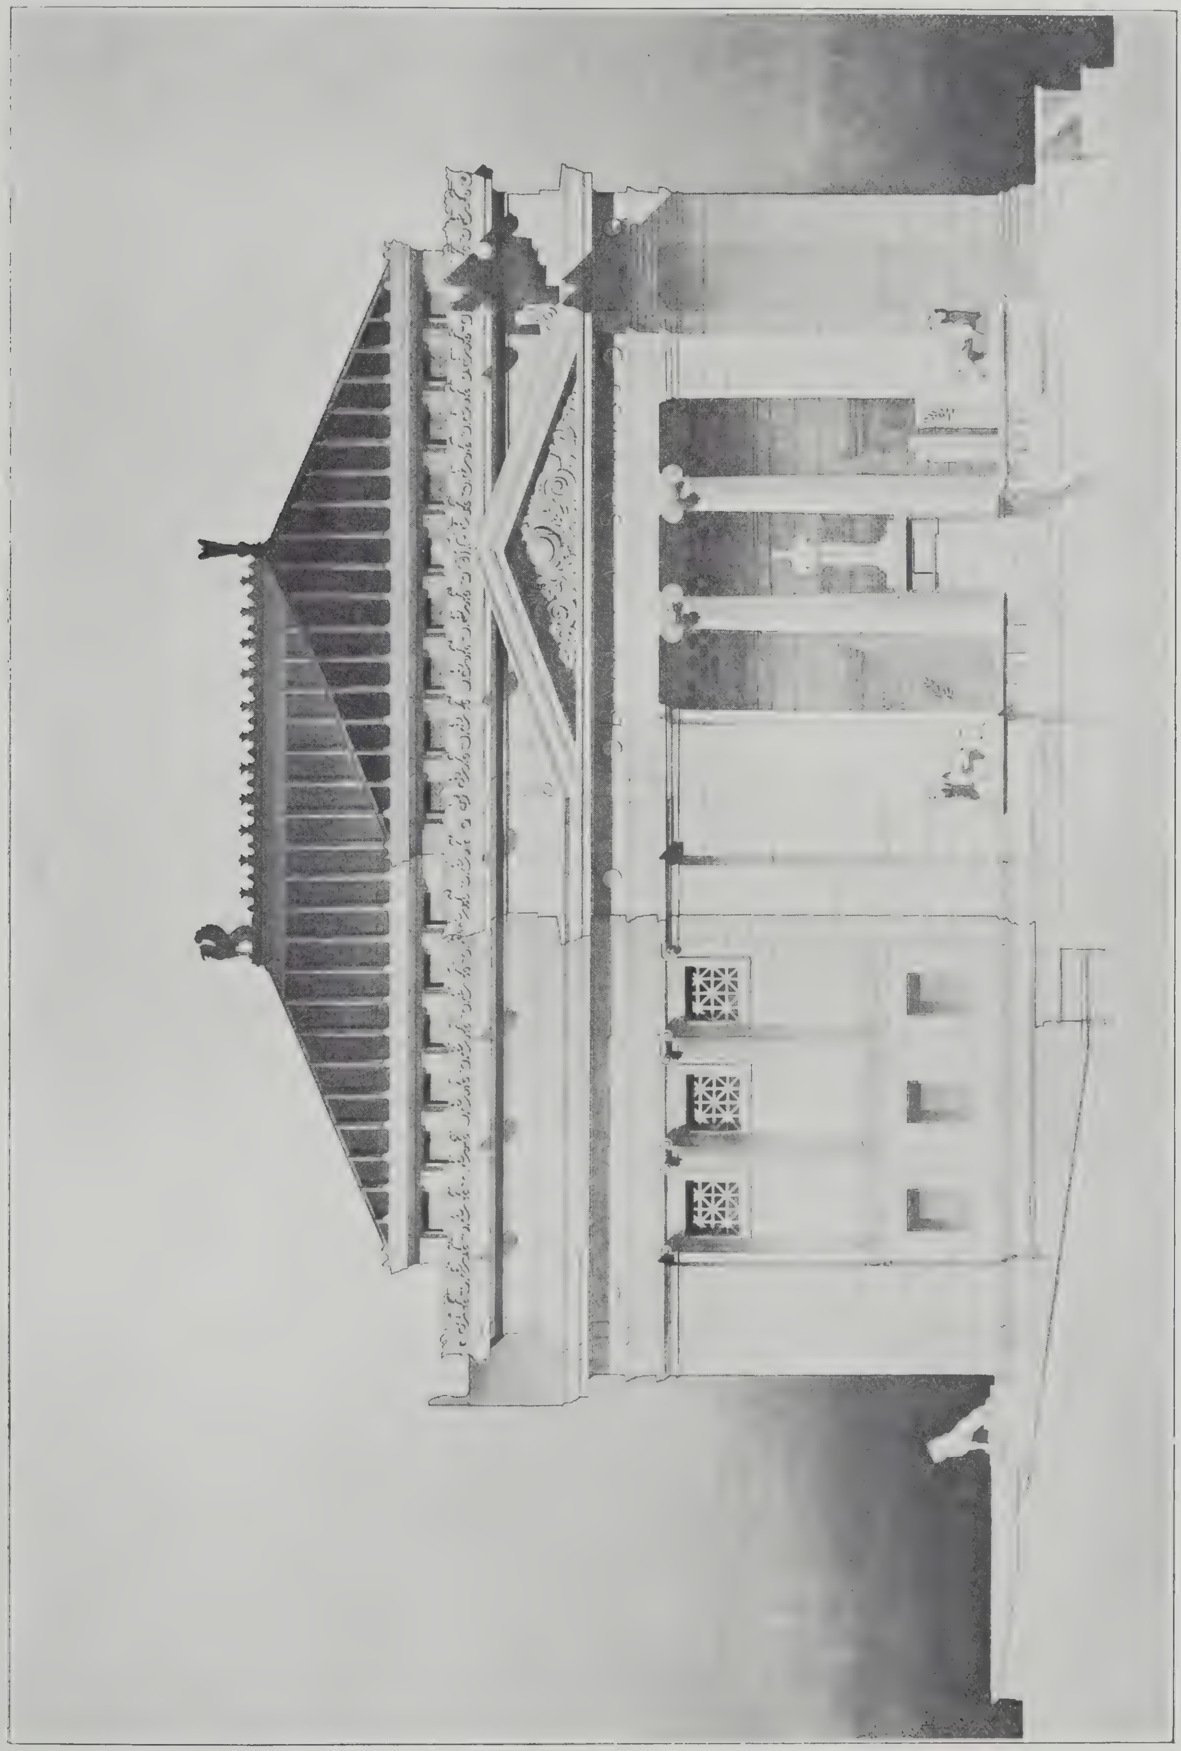
Not the least interesting point in connection with this report was the recommendation that buildings should be constructed of reinforced concrete for the purpose of resisting earthquake shocks.

Plan of Bagnio, the Summer Capital of the Philippine Islands.

The necessity of providing for a summer capital for the government of the Philippines led to the creation on the hills of Bagnio, about one hundred miles from Manila, of a city laid out on a plan similar to that made by L'Enfant for the city of Washington, in that it provides for such public buildings as may be needed for Government offices, for the service of the city itself, and for the healthfulness, convenience, and recreation of the people, and all these functions are so arranged as to make a unified and orderly city.

Plan of San Francisco.

This brilliant monumental study in town planning was made by Mr. Burnham, assisted by Mr. H. Bennett, in the year 1904, for the Association for the Improvement and adornment of San Francisco. Unlike Washington, Manila, and Bagnio, San Francisco is not a capital city, but a



STUDENTS' PRIZE-WINNING DESIGN FOR A SAVINGS BANK. JOHN RUSSELL POPE, ARCHITECT.

great seaport commercial town. It is consequently less monumental, and possesses fewer centres of interest than those cities. The plan prepared by Messrs. Burnham and Bennett is remarkable, principally as showing how it would be possible to convert the inconvenient and uninteresting plan of San Francisco into one that would be both convenient and beautiful by cutting a few diagonal avenues and widening a few streets. The increment in property value throughout the city alone would well justify the necessary expenditure for nearly all the work proposed. The sketches were most interesting, and the treatment of local centres, as Telegraph Hill (p. 550), and the Athenæcm looking to the sea (p. 551), are most valuable compositions and suggestions. The charming and domestic side of the design was suggested by the treatment for existing street frontages, and the strength of the planner was apparent in the plan of the new centre for the city.

The Plan of Chicago.

The Columbian Exposition of 1893 was the beginning in our days and in the United States of the orderly arrangement of extensive public grounds and buildings. It stamped itself indelibly upon the memories of all who saw it, and it continued to live in the memory of the people and dwell upon the minds of the architects who had created it. To the people of Chicago it called for some permanent memorial of itself. It suggested the improvement of the water front of Chicago. The year following the Exposition, the Park Commissioners proposed the improvement of the lake front from the site of the Exposition—Jackson Park—to Grant Park, a distance of about seven

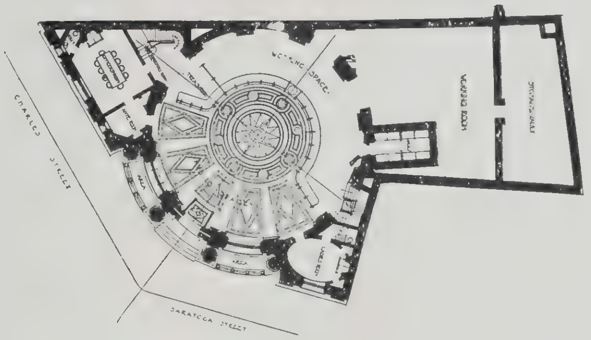
PARKER, THOMAS, AND RICE, ARCHITECTS.



METROPOLITAN SAVINGS BANK, BALTIMORE: PLAN.

miles. A plan was prepared for the Commissioners, and subsequently exhibited at a dinner given by the Commercial Club. Many of the business men who were present at this gathering were emphatic in expressing their conviction that the scheme would be of the greatest value to Chicago and should be adopted and carried into execution. This was the inception of the project for a park out in the lake, having a lagoon between it and the shore, and for several years Mr. Burnham and his assistants worked on developing the design.

In 1906 the Merchants' Club arranged for the preparation of a complete project for the future development of Chicago. The following year this club merged with the Commercial Club under the name of the latter, and the work has continued under the auspices of that association. As proving the intensity of interest in this plan, it must be noted that the committee met several hundred times during the progress of the work; during many weeks meetings took place daily, and throughout the entire time no week passed without at least one meeting.

In preparing this enormous design the Commercial Club undertook the following task:—

First, to take into consideration the physical conditions of Chicago as they now exist.

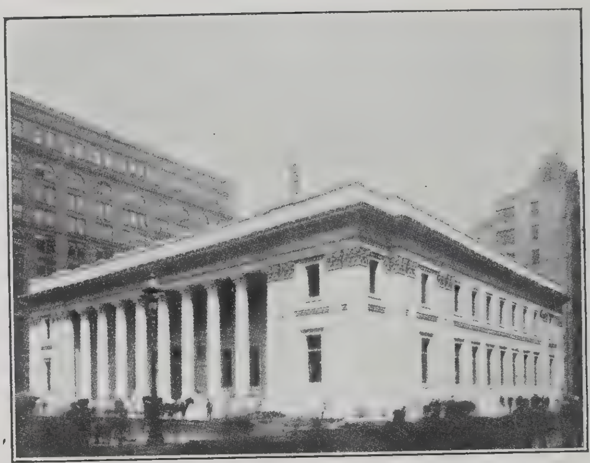
Second, to discover how those conditions may be improved.

Third, to record such conclusions in the shape of drawings and texts which shall become a guide for the future development of Chicago.

It is quite impossible to go into even the most general details of a project so vast as this. If the idea were proposed for any other city on earth it might be put down as a most extravagant dream. But with Chicago nothing is impossible. Anything that is really worth doing is probable of execution. The people of Chicago are so accustomed to results beyond their most sanguine predictions that they hope easily, believe easily, and accomplish easily. They are a people trained in intense commercial activity, who understand that great success cannot be attained unless the special work in hand be entrusted to those best fitted to undertake it. It is the habit of Chicago's business men to select someone to take the responsibility in every important enterprise, and to give to that person earnest, loyal, and steadfast support. In the preparation of this plan, which is perhaps the most gigantic work ever placed in the hands of an architect, Mr. Burnham was selected to take the principal responsibility. The plan, which as a scientific and artistic treatment of the city as a whole is unrivalled by that of any existing city in the world, is now complete, and with the many beautiful drawings of details, has been published this year in a magnificent quarto volume by the Commercial Club of Chicago. The conception of this plan of itself—had he done nothing else—is enough to give to its author a permanent place among the greatest architects of his or any other century. We have, however, an abundance of monumental works by him which might be regarded as details of this plan, and any one of these "details" would be sufficient to make a reputation for most architects.

In the above notes it has been attempted to gather together in brief review the more important works of this architect; more than that it is impracticable to do in these pages—it is impossible, within the space at command, to do so much as even give a list of the numerous houses, many of which are remarkable for charm and dignity, or of the gardens, park shelters, small club houses, etc., built from his designs; nor to mention more than the best known of his many good deeds done in behalf of his art, his confrères, and of the younger men. It is almost needless to recall his famous letter to the Secretary of the Treasury—Carlisle—during the period of his Presidency of the American Institute of Architects, or the importance of his influence in bringing about reforms in the office of the Supervising Architect of the United States Treasury Department; and placing a competent architect in charge of the designing of the smaller post offices, custom houses, etc.

Two things which he has done are, however, especially worthy of note and grateful remembrance: First, by his fellow citizens, as regards the important duties he has performed, *as a citizen*, in giving gratuitously his time and thought to the planning of cities in order that posterity may enjoy advantages beyond those of the present generation—a labour which somebody ought to perform for nearly every city, and a task which Mr. Burnham has undertaken in the instances mentioned. Second, by good sportsmen, the world over, who love fair play in all things, and by that numerous band of men who are to be classed with "Full many a gem of purest ray serene," whose worth is never generally known, but who can applaud the breadth of character in a man who brings to light some of their number by sharing the credit for his work with those of his subordinate co-workers who are his principal assistants upon a given work. It is due to this generous trait that the "and Co." ordinarily appears after Mr. Burnham's name. It is, therefore, in a sense not a commercial title, and deserves honour as well as respect in this unique case—it relieves the necessity of an explanation of the association, upon a design, of a number of artists, and engineers, most of whom are in his employ, but whose identity he chooses to reveal rather than conceal, and whose names he has coupled with his own. He is always the real designer of the work which bears his name; and except in those instances when the name of the assistant is fully acknowledged, may be always safely regarded as the sole architect.



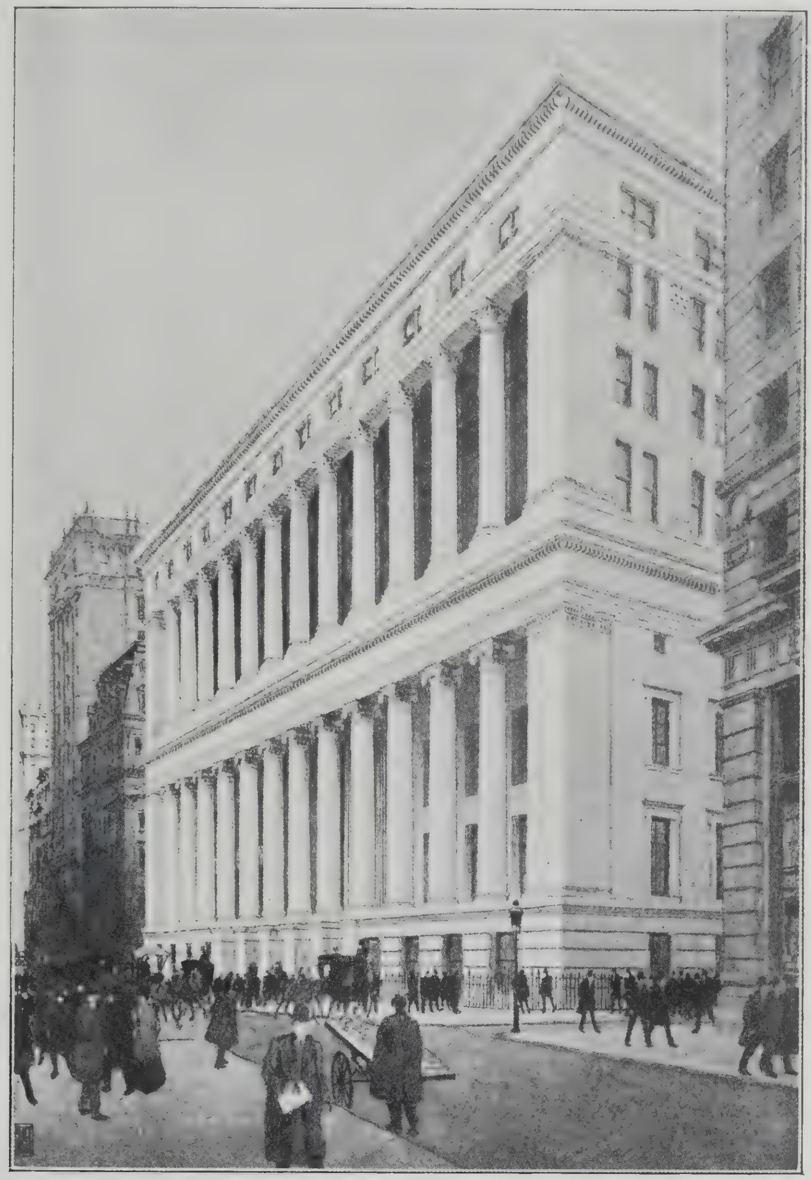
ILLINOIS TRUST AND SAVINGS BANK.
D. H. BURNHAM AND P. J. WEBER, ARCHITECTS.

THE LATE CHARLES FOLLEN McKIM.

The death of Charles Follen McKim, which occurred on September 14th, 1909, was a distinct loss to the world of Art, for he was unquestionably an artist. Born in Chester County, Pennsylvania, on August 24th, 1847, he was educated in the Scientific School of Harvard University, where, when about twenty years old, he took his degree. For the next three years or so he was in Paris, studying in the Ecole des Beaux-Arts and in the Atelier Daumet. Then returning to America, he entered the office of a New York architect, where he met young Mead, who, in 1880, when Stanford White returned from Europe, formed the second name in the now world-famous triple partnership of McKim, Mead, and White.

The work of the firm of which Dr. McKim was senior partner has perhaps exceeded in volume, variety, and aggregate cost, that of any other architect or firm of architects of any era. It includes, as stated by the writer of an important biographical article that was published in the October issue of the "Architectural Review," from which we are at liberty to quote, "every class of building, in extent, from the tiny bungalow of the late Mme. Modjeska in California, to the vast pile of buildings for the New York station; in style from the rugged and picturesque Casino at Narragansett Pier to the grave and stately library of Columbia University; as to use, from the gates of Harvard University to the skyscraping new municipal offices of the city of New York." Among university buildings the firm's commissions included Virginia, Columbia, New York, with gates and buildings at Harvard, some of the buildings at Brown and Cornell; among libraries, that at Boston, which is one of the best of their earlier designs; of clubs, the University, Metro-

BANKING HALL, NATIONAL CITY BANK, NEW YORK CITY. McKIM, MEAD, AND WHITE, ARCHITECTS.



THE NATIONAL CITY BANK, NEW YORK CITY, AS ALTERED BY McKIM, MEAD, AND WHITE, ARCHITECTS.

The old bank, to which a story has been added, is shown on p. 552.

politan, Harvard, Lamb's, Freundschaft, and Century in New York, the Mount Royal at Montreal, and the Algonquin at Boston; of Museums, the Brooklyn Arts and Science, the Walker Art Museum at Bowdoin College, Maine; of Government buildings, the new New York Post Office, the War College, the interior designs of the Executive Mansion at Washington, the Rhode Island State Capitol at Providence. The firm built the Nangatuck High School, the Madison Square Garden structures, Boston Symphony Music Hall, the Washington Arch, the New York monuments to Farragut, Cooper and Hale, the Chicago monuments to Logan and Lincoln, the Battle monument and Cullom Hall at West Point; churches at Stockbridge (Mass.), Nangatuck, Rhode Island, Chattanooga, Tennessee, Moristown; and the Judson Memorial Church and Dr. Parkhurst's church in New York. From an enormous list, only some of the more prominent buildings can be mentioned here. They comprise two of the best buildings at the 1893 Columbian Exhibition of Chicago, namely, the Agricultural Palace, and the New York State building. Their domestic work comprises almost countless residences, among which may be mentioned the Villard, Robb, Morton, Vanderbilt, and Tiffany houses at New York, many town houses at Buffalo, Chicago, Boston, and Washington; and almost countless country houses, notable among which are the houses of Mrs. Elliot F. Shepard at Scarborough (N.Y.), of Mrs. Herman Oelrichs and Mr. E. D. Morgan at Newport (Rhode Island), of Mrs. Clarence Mackay at Roslyn (N.Y.), of Mr. Frederick Vanderbilt at Hyde Park (N.Y.), and of Mr. Ogden Mills at Staatsbury (N.Y.)—all of which might be not inaptly described as palaces. The firm's business buildings and hotels are also legion, and only a few of them can be named, such as the original Imperial Hotel, the Savoy, and the Yosemite Apartment House in New York; offices of the New York Life Insurance Company in New York, Kansas City, and Omaha; the Goelet and Warren buildings, the Tiffany and Gorham shops, and the "New York Herald" and "Judge" buildings in New York; the great Niagara power-house at Niagara Falls (N.Y.), the printing house of the "Cosmopolitan" at Irvington on the Hudson; the Cable building and the huge Sherry's Restaurant at Forty-fourth Street and Fifth Avenue, New York; the Girard Trust Company's bank at Philadelphia; the State Savings Bank at Detroit; the Bank of Montreal in Canada; the National City Bank, the Bowery Savings Bank, and the two buildings of the Knickerbocker Trust Company, one in Wall Street and the other in Fifth Avenue, New York. This catalogue, in its bare enumeration of big buildings of varied character, suggests amazing versatility and resource; and those who have seen the buildings themselves, or merely illustrations of them, admit that in this vast mass of work there is much that is noble, dignified, and truly artistic. The early efforts of the firm seem to be based on Hunt and Richardson. Later, Renaissance models were followed, but not slavishly; for, as a writer during that phase observed: "Whatever criticism has been made at length on the use of precedent in their buildings separately considered, it must be acknowledged that the firm of McKim, Mead, and White have always possessed an exact estimate of the value of ancient forms as stimulants to the imagination. Theirs is a method of selection—a choosing of the beautiful and useful, a rejecting of the inartistic and commonplace of former architectures. It is not, as some would suggest, a blind groping after an harmonious effect, but it is marked by the scientific element which distinguishes the artist from the artisan. They seem able 'out of a senseless Nothing to evoke a conscious Something.' Their adaptations have taught them, in their maturer work, to add soul and grace to purely modern products."

For much of the merit of these works Mr. McKim must receive the credit. It was he who drew the attention of America to the riches of European architecture, by adapting foreign successes to American needs, especially in the application of Classic and Renaissance design to modern problems. A true patriot, like his father before him—James Miller McKim was an anti-slavery leader—he was above all a true artist. By adopting mural decoration for the halls of Boston Public Library, he may be said to have introduced it to America, and to have made for Sargent, Abbey, and Puvis de Chavannes the opportunities which they have known so well how to make use. He had a fine and true taste in sculpture as well as in painting, and he gave splendid employment to the talent of the sculptor Augustus St. Gaudens, a friend from student days. He gave many opportunities also to Martiny and McMonnies. The beautiful Bacchante, which is now the envied possession of the New York Metropolitan Museum of Art, was commissioned to McMonnies by McKim for the Boston Library, which lost it in consequence of an absurdly prudish objection to the nude by a puritanically prejudiced section of the community. The French Government ordered a replica of this statue for the Luxembourg.

It would not be correct to ascribe to Mr. McKim solely any of the work of the firm. It is safe to say, however, that none of the work ever went through the office without the benefit of his criticism and advice; but, of course, the other partners are to be reckoned with. When Mr. White died, his admirers were disposed to insinuate that the artistic spirit of the firm died with him; but since his death the work of McKim, Mead, and White has undergone no perceptible change of character! and, in fact, the partners worked so beautifully together, and saw things from so similar a standpoint, that so long as Mr.

Mead remains the good work will go on. If it be asked, who took the lead? the answer is, sometimes one, sometimes another; but if there was one who had the final determining word, whose judgment was deferred to by his associates, that one was assuredly Charles Follen McKim.

Mr. Francis S. Swales, in a memoir contributed to the "Architectural Review," concludes with the following tribute to the man he was privileged to know: "McKim's life was a full and busy one. Work, honours, distinctions, were crowded upon him; he was not less distinguished as a patron of art, connoisseur, and clubman, than as an architect. He was a friend and patron of Columbia University, and a founder of the American School at Rome. As a benefactor of art in the most material way he took a leading part, and deserved the greatest praise."

III.—Commercial Buildings.

That the commercial buildings of America are a class by themselves, are the result arising from the demands of the utilitarian minds of the men of commerce, and are unlike the corresponding buildings of any other country, is generally and fully recognised. That many of these buildings are thoroughly successful as designs—or are at least admitted to be so by the majority of architects in their own country, and by Europeans who have had the opportunity to study them at first hand —is a fact that is probably much less familiar.

The Tall Building.

Of the beauty of the high type of building to which the British mind reverts whenever mention is made of American architecture, it may be said that, as with any subject involving the study of beauty, very much depends upon the prepossessions and the receptivity of the observer.

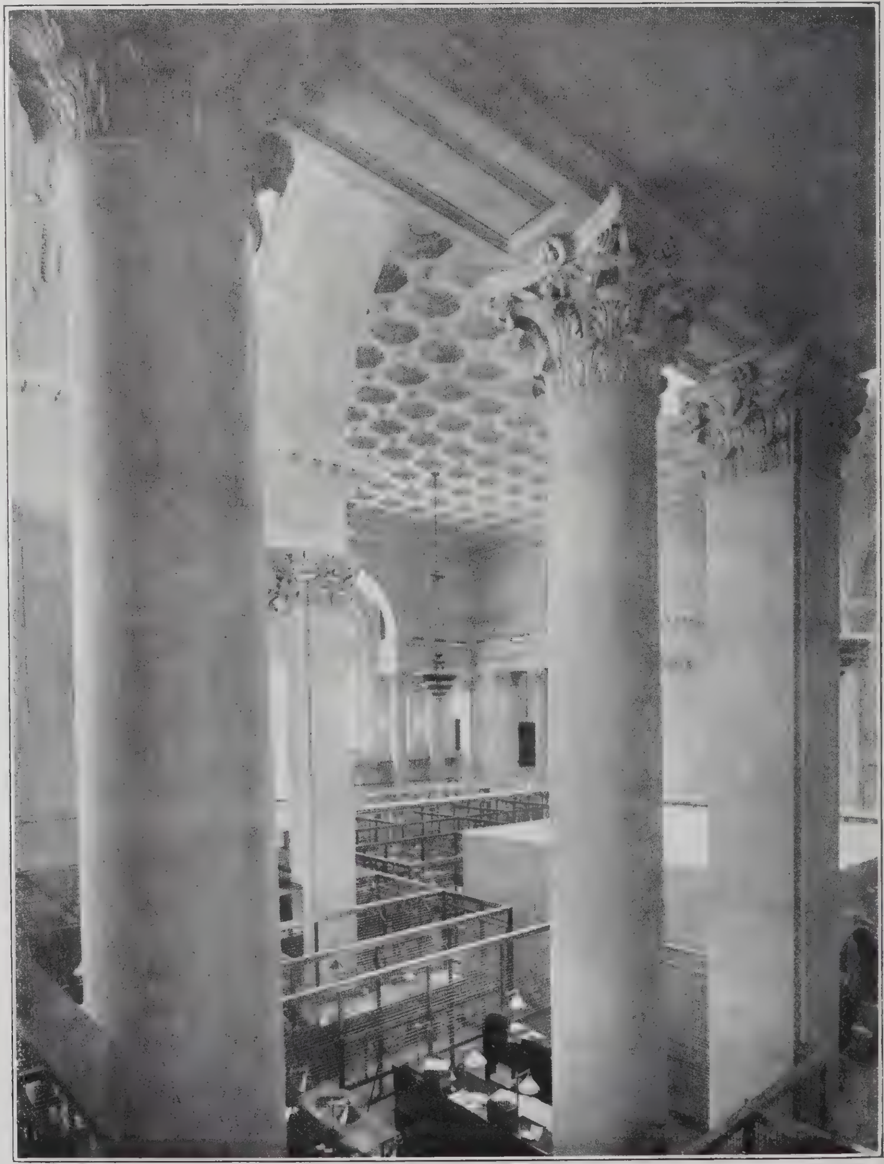
These buildings may be classed under a few general headings which will cover most cases, namely: (1) Those of one or two storeys, which include the better class—the class that seeks to be conservative, at least in appearance—of banks, the clearing houses, exchanges, and the buildings occupied in their entirety by the offices of a single company which prefers to preserve its identity in segregation rather than to lose some of it by taking offices in a building occupied also by other tenants. (2) The shops or "stores," industrial and storage buildings, usually from three to ten storeys in height, which are not very different in their requirements from those on this side, but possess certain features, general and national characteristics of design, which render them architecturally interesting—which, in fact, give them their peculiar distinction. (3) The buildings for office purposes, those of more than ten storeys in particular, which sometimes also contain a bank, shops, or club—occasionally all of these—and a restaurant, large meeting hall, or other feature which permits form to follow function without making the whole exterior exactly like a honeycomb. This last is the American "skyscraper," the type which has caused so much discussion—from several points of view—among the engineer-architects as to its permanency or "life," among the artist-architects as to its adaptability to artistic solution, and among other people, not very well informed upon the subject, as to its safety, convenience, necessity, healthfulness, effect upon neighbouring property, and its general justification. To the much-debated and much-abused skyscraper, therefore, it may be well to devote particular attention. In accounting for it, or in attempting to trace its genesis, another backward glance at the history of the country becomes necessary.

Historical Data.

Everybody knows, though the data are easily forgotten, that, as recalled in the introductory section, the United States became a nation less than one hundred and thirty-five years ago; that its commercial prosperity suffered almost to ruin during the seven years that it fought for independence; that it again suffered a severe set-back in the struggle with Britain known as the war of 1812; that fighting with the Indians continued from the founding of the various colonies of Spain, Britain, France, Holland, and Sweden up to within the memory of men who are to-day in the prime of life. There was a war with Mexico in the forties, and the well-known struggle over the questions of state rights or union, and of slavery, in the early sixties. But if these had the effect of a temporary check upon commerce (and the latter undoubtedly left the whole southern half of the country in a state of poverty bordering upon ruin), the commercial activity which began during the period of colonisation continued with redoubled energy after the civil war; new villages sprang up and, with perhaps unprecedented rapidity, developed into large towns in a few years; the towns along the great lakes became flourishing cities. Then the great fires of Boston and Chicago, the disastrous financial panic, the Centennial Exhibition at Philadelphia, all occurring during the seventies, gave tremendous opportunities for rebuilding on better lines, checking the spirit of speculation, establishing business after the return of prosperity, upon a firmer basis, and bringing the country in contact with the arts and products of the old world, with a consequent rapid growth of travel and study by Americans in Europe.

Hunt and Richardson.

In architecture the personal influence of two men, trained in the Paris Ecole des Beaux-Arts, was especially felt—of Richard Morris Hunt (1827-95), through his words and deeds quite as much as through his works; and of Henry Hobson Richardson (1828-86), predominantly through his works. Reference has already been made, in the foregoing summary of the paper read by Mr. Swales before the R.I.B.A.,



THE NATIONAL BANK, NEW YORK CITY: DETAIL. McKIM, MEAD, AND WHITE, ARCHITECTS.

to these two notable names in the history of American architecture, but it cannot be too strongly emphasised that these two men, with others of less fame but high ideals and thorough culture, did much to elevate architecture as an art in the public esteem. Richardson was probably the first American architect to treat a commercial building as a type different from a building for shops and flats, and his Lionberger building in St. Louis, and his well-known wholesale store for Marshall Field in Chicago, may be numbered among the earliest examples of distinctively commercial architecture in America. These, though designed for prevailing conditions and possessing great originality in design, as well as in the use of materials, may be said to differ from similar structures in Europe only as much as these might differ from one another; the distinctive character was given by the genius of the architect working along lines of common sense.

Advent of the Iron Skeleton.

The system of construction was at that time much the same as it is in England at the present time. The outside walls were of self-supporting masonry and also carried a portion of the floor loads, while iron columns and girders were only used internally. Practical conditions limited the height of such structures to about nine or ten storeys. The necessarily proportionate thickness of outer walls, and the pyramidal foundations, were found to occupy so much valuable ground and basement space that it was not economy to go higher. In Chicago, as in New York, there was keen competition among business men to concentrate themselves within a limited area. The land within such areas consequently acquired enormous value. The alternative to building wide (which was impossible, concentration being not only physically compulsory, but essential to convenience and dispatch) was to build high. The problem of building high was solved by the introduction of the iron "skeleton" construction. This was first employed by the architect W. L. B. Jenney in the ten-storey building for the Home Insurance Company in Chicago in 1883, thus creating the type which, irrespective of the individual architect, may be considered as being purely American in origin and development.

Mr. Jenney's System.

"In order to obtain a maximum of light for the offices proposed in his new design, Mr. Jenney decided to reduce the width of all exterior piers as much as possible, and to use cast-iron columns within the piers to carry the floor loads, thus relieving the masonry piers of these loads, and consequently reducing their areas. . . The exterior piers were made self-supporting, but the spandrel portions, between the top of one window and the bottom of the window above, were carried on iron girders placed in the exterior walls and extending from column to column." The immediate success of the new type of construction led to its general adoption, and to its speedy development into the modern steel-frame "Cage" construction, in which all structural members are of rolled steel with riveted connections. All external masonry above the first floor, as well as the floor loads, is supported upon members of this steel frame, and the height to which it may be carried is limited naturally by problems of economy and the elevator service, and in some instances artificially by legislative enactment.

Genesis of the Tall Building.

The high building was brought into existence as a means of making money for its owners; but obviously it could not have served this object, unless it had commended itself by its convenience and utility. By the American business man it is regarded as a great time-saver, focussing and facilitating business transactions, eliminating, dispensing with the need for an extravagant number of messengers, assembling the staff under close supervision and control, and altogether economising the expenditure of both time and money, and thus securing to the business heads more leisure and more money to expend in the enjoyment of it. It must be evident, writes Mr Swales, to anyone with a knowledge of the conduct of business in very large offices that too large a ground area can be a serious drawback, that horizontal extension quickly reaches a practical limit, too much time is spent in walking from place to place; while an almost ideal arrangement is one with the principal office on the first floor opposite or within a few steps of the elevators and stairs, with the offices of the principal departmental assistants ranged one over the other directly above that of the chief. To what extent this must be considered is evident when one remembers that a large railway office usually contains several hundred clerks. There is a fourteen-storey building in St. Louis, one hundred by one hundred and fifty feet, occupied entirely by such offices, and Mr. Swales was told by one of the officers of the company that the building is entirely inadequate for its purposes. This is, however, a rather exceptional case. More often the building is large—large beyond the requirements of one company, the surplus space being let out to smaller occupiers; indeed, often being erected solely for the occupancy of the latter—brokers, promoters, professional men—rendering the commercial character of the structure dominant and conspicuous.

Engineer and Architect.

It is not surprising to find engineers claiming this class of work as belonging to their profession, and endeavouring to place the architect upon an inferior footing. One engineer who has boldly advanced this claim, writes protesting that architectural adornment is "a waste—is, to put it in plain English, perverting someone's money," and, in the same article, admits that "high rents cannot be obtained from a building with its halls finished in concrete when the adjoining buildings have a marble finish." His inconsistency is amusing; for how does it happen that a man so absorbed in business that he is supposed to care nothing for appearances or surroundings—who by the engineer is rated so low as not to appreciate the difference between a building that possesses architectural merit and one

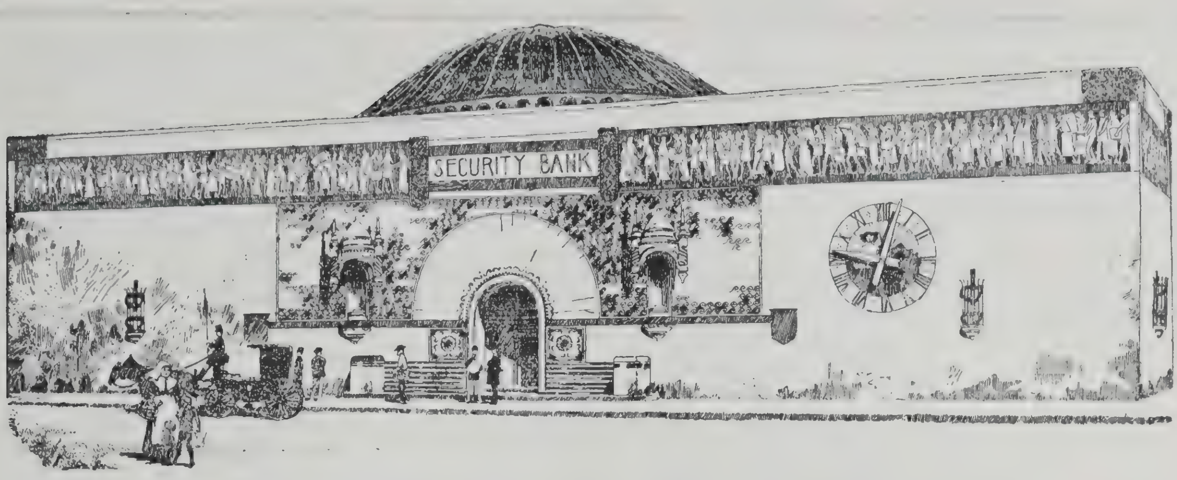
LIBRARY, COLUMBUS, OHIO. ALBERT RANDOLPH ROSS, ARCHITECT.

that is as bald as a factory, or perhaps vulgar beyond description—will not pay, for the same amount of space, just as high a rental for an office in the economical concrete construction of the engineer as in the structure with the marble finish? This scornful allusion to "marble finish" seems to suggest a subtle something that the engineer, with his narrow training, has failed to apprehend. Apparently, he is unable to realise either the æsthetic or the commercial value of an agreeable air of luxury and comfort; an indefinable air about the building that is not fully accounted for by the suggestion of mere expense—that quality which is present in every good design, and which the architect calls "character" and the layman "style."

Building for Time and for "Eternity."

Here, as elsewhere, we find that the builders are of two familiar types. There is the speculative builder, who puts up the kind of building that is expected to pay ten to fifteen per cent. for, say, fifteen years, and then to be torn down; and there is also the investing company which erects buildings of intrinsic merit, and entrusts the whole undertaking to the ablest architectural talent obtainable; sometimes by direct selection, as in the case of the buildings for the New York Life Insurance Company, whose principal buildings in New York, Omaha, Kansas City, Montreal, and elsewhere, were

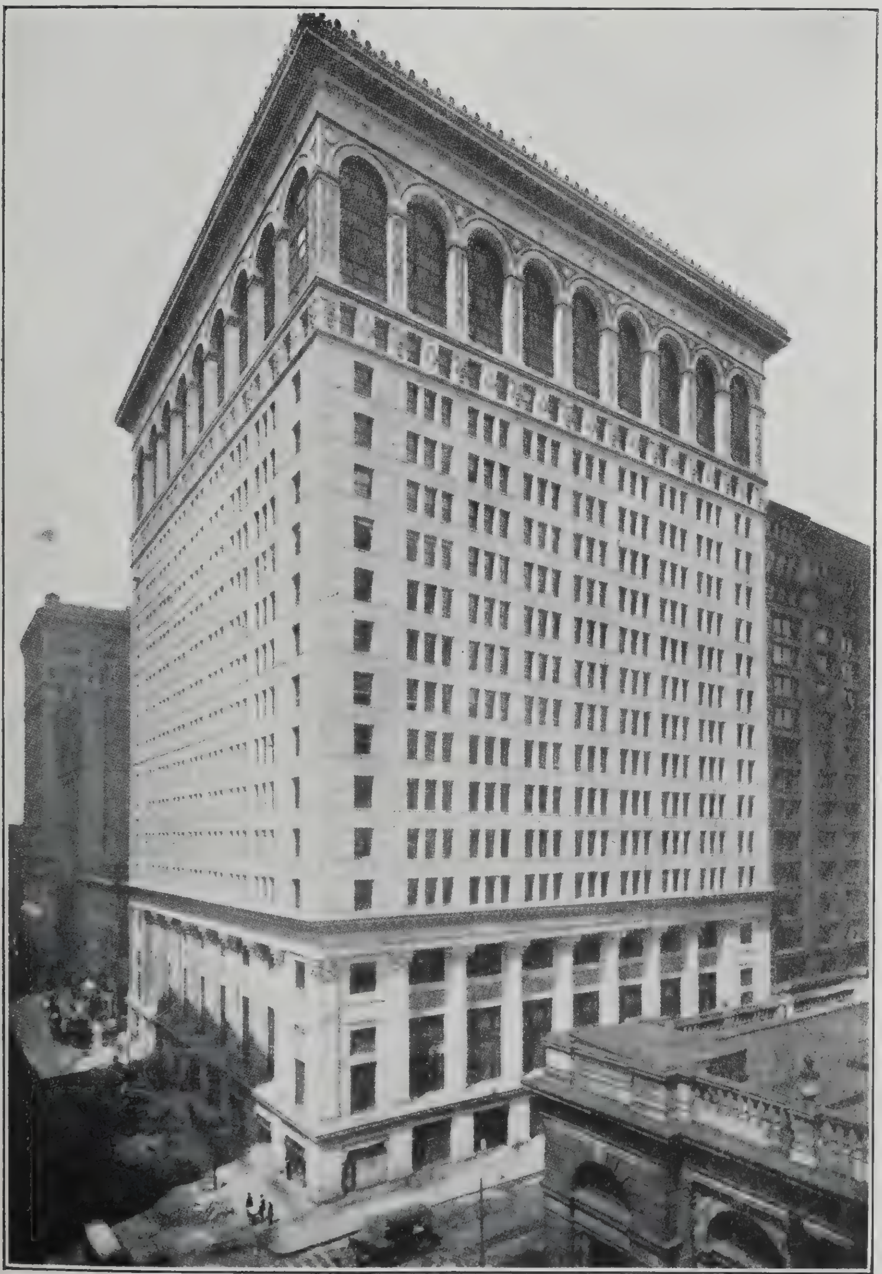


SECURITY BANK, MINNEAPOLIS, MINN. HARVEY ELLIS, ARCHITECT.

designed by McKim, Mead, and White, and by Babb, Cook, and Willard, the building for the "Mail and Express" by Carrère and Hastings, and the Singer Building by Ernest Flagg, both in New York; sometimes as the result of competition, a notable example of which is the American Surety Company's building in Broadway, New York, by the late Bruce Price (p. 532).

Magnificence that Pays.

It may be freely admitted that there may be an ulterior motive to account for extreme magnificence. These companies advertise, and every really alert business man knows that there is a public which can be reached through the channels of fine art that might not be so readily accessible by any other means—a public well-informed, critical, and influential—with a love of art and of luxury, which discriminates against the ugly and incompetent—a public not at present in the majority anywhere, except perhaps in France or Austria, but, nevertheless, sufficiently numerous and potent in America not to be ignored by astute men of affairs. The desire to gain the patronage of this select community is leading to the study of its requirements, is awakening an interest in its ideals, bringing about a genuine conversion to its views, and an inclination to advance its standards. The tendency to strive for higher and truer standards of taste in design is one of the most hopeful signs in the American life of to-day; and, consequently, American architects are in the happy position of enjoying unprecedented opportunities to prove their ability as artists; and the enlightened policy of offering a liberal purse for the endowment of artistic enterprise has continued with varying success during the last eighteen or twenty years, in Chicago, Buffalo, St. Louis, Boston, Baltimore—in all the largest cities, but most especially in New York.



THE COMMERCIAL BANK BUILDING, CHICAGO. D. H. BURNHAM AND CO., ARCHITECTS.

Influence of Environment.

The borough of Manhattan, New York, is an island about a dozen miles long south to north from Battery Park to the Harlem River, and two miles wide east to west from the East River, which separates Manhattan from Brooklyn, to the Hudson River, which is a boundary between the States of New York and New Jersey. In the triangular space at the southern extremity and bounded on the north by, say, Chambers Street, City Hall Park, and the Brooklyn Bridge—a triangle almost equilateral, and less than a mile in altitude—is the portion known as the Wall Street district, corresponding to New York as the City does to London. Within this area are to be found examples of nearly all the early experiments, as well as the most highly developed types of tall buildings. It is also the district where the demand for space is greatest, and where, consequently, the value of land reaches the most excessive and almost incredible extremes. The tendency continues; and, unless some unforeseen contingency arises, the entire district will before long be exclusively occupied by tall buildings; while those of ten or twelve storeys will probably have their height doubled.

Two Chief Types of Tall Buildings.

Only one or two types represent more than a merely experimental attempt to solve the artistic problem. There are two types which appear to be in course of evolution; one expresses the office unit by means of windows alone, either by a single or the more frequent double window to each office. The exterior is designed with sole reference to the material with which it is clothed and the purposes to which it

GIRARD TRUST BUILDING, PHILADELPHIA. McKIM, MEAD, AND WHITE, AND ALLEN EVANS, ARCHITECTS.

THE STATE SAVINGS BANK, DETROIT. McKIM, MEAD, AND WHITE, ARCHITECTS.

is put, no special heed being taken of the steel skeleton, the lines of which are marked by the masonry and acknowledged externally only by the slight reveals to the window openings, and the ranging of openings one immediately over the other. The other type very clearly indicates the light structural lines of the steelwork; in fact, only so much masonry as is necessary to protect the steel frame against disintegration and danger from fire is employed, the protective material being usually of terra-cotta. The manufacture of this material has been carried to a very advanced state of perfection, and it has been very largely adopted for both constructive and decorative purposes.

Early Attempts at Artistic Design: Harvey Ellis.

Of the first-mentioned type perhaps the earliest example of design which could be in the least regarded as architectural was a project for a twenty-eight-storey building (p. 533) by the late Harvey Ellis, a man possessed of an extraordinary imagination, and combining an unusual understanding of the romantic schools of architecture with a remarkable facility in the use of brush, pen, and pencil. He designed many wonderful "pipe-dreams," and always had some equally wonderful —though at the time regarded by his friends as impracticable—idea for their construction.

"Cage" Construction.

He is alleged to have been the original proposer of the "cage" construction, the modern type developed since the skeleton

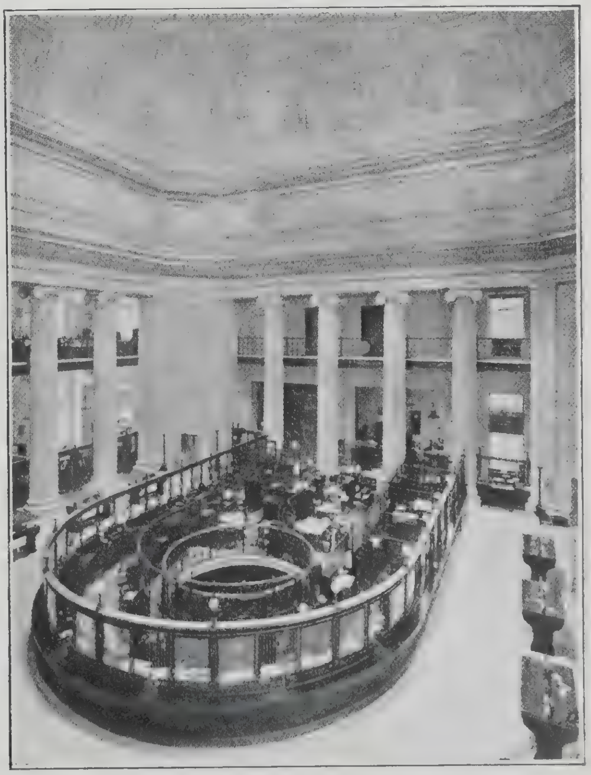
JENNEY AND MUNDIE, ARCHITECTS.



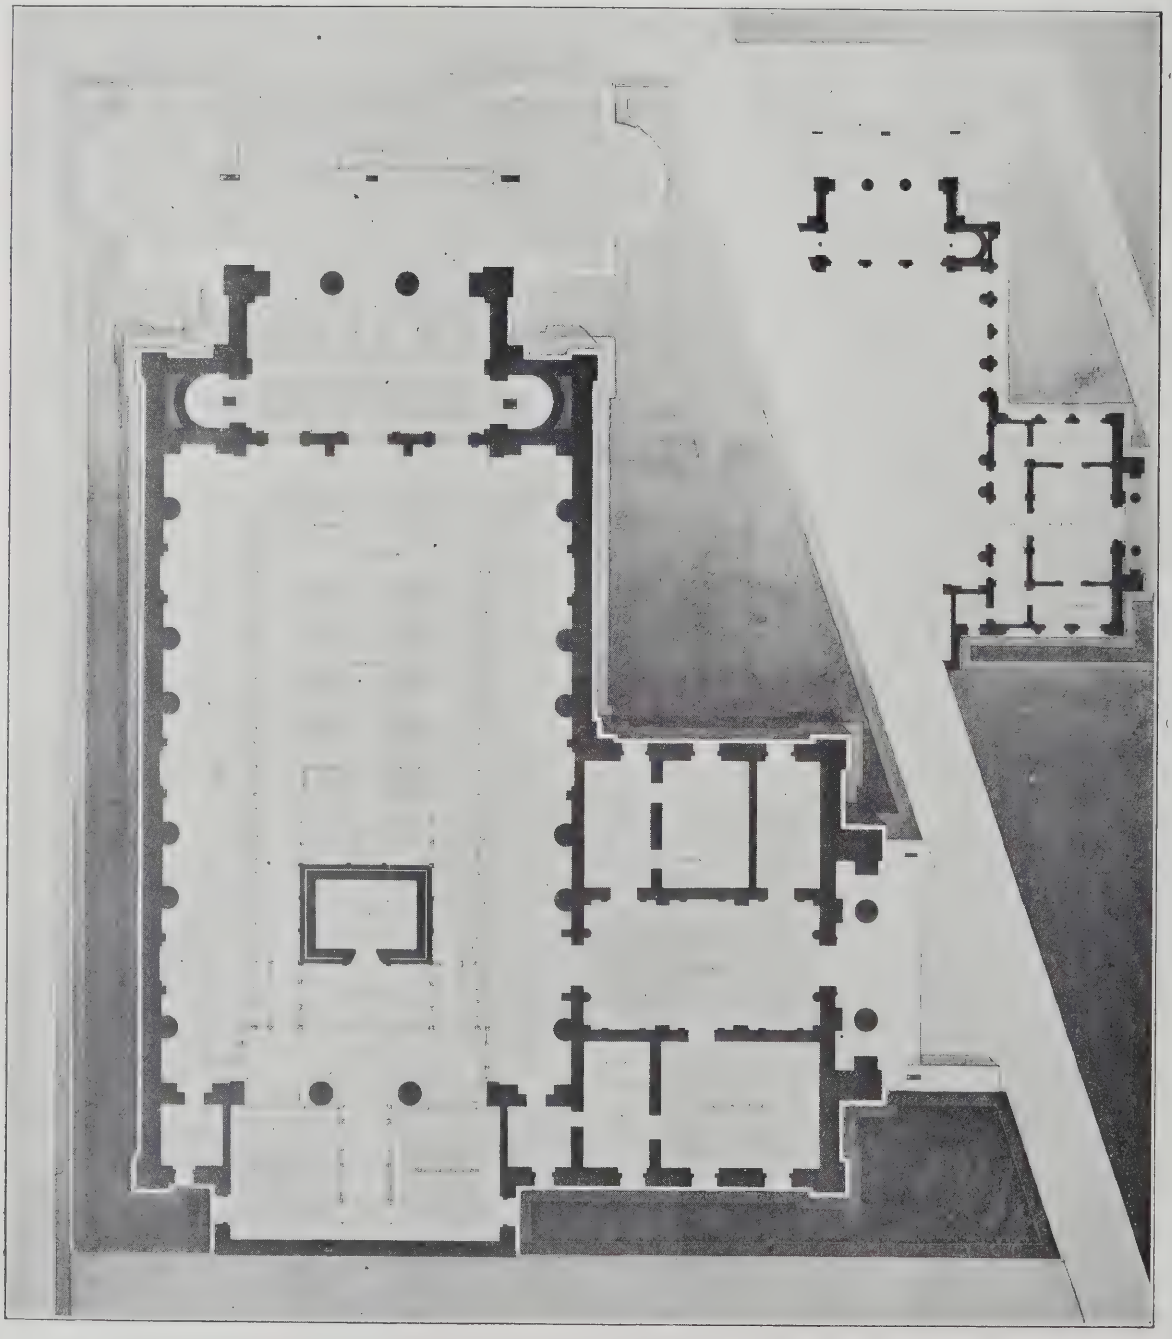
GIRARD TRUST BUILDING, PHILADELPHIA, PA: BANKING ROOM. TYPE B PLAN.

type was first used by Jenney in Chicago. This project, made in 1888, was designed in the then popular style of Richardsonian Romanesque for Mr. L. S. Buffington, of Minneapolis, who patented the idea of skeleton construction which has since been generally admitted and believed by architects and engineers to be the invention of Mr. Jenney.

Bruce Price.

Ellis's design probably owed its inspiration to the tower of the Alleghany County Court House in Pittsburg, and it was inevitable that the next design of promise—one in which Classical or Renaissance detail was proposed—should find its suggestion in another existing tower: the tower of St. Mark's in Venice. This was the fine study for a building for the New York "Sun," thirty-two storeys high to the top storey in the pyramidal roof, by the late Bruce Price (see p. 531). Though owing so much to St. Mark's, the design for the "Sun" tower was handled in a way that proved power, individuality, and high scholarship in its author. There was no attempt to imitate the buttress-like lines of the Italian tower, no effort to conceal the office windows within *motifs* suggesting bays of a masonry construction suitable only to the support of large stone vaults, which was the practice current at the time in all high buildings pretending to architecture, as for instance the Union Trust Building. It may have owed something to the design by Mr. Ellis, though it may be noted as a point of interest that the latter depends on the use of different-coloured stonework for its "values," as the painters call them—its effects of light, dark, and half-tone. In the design by Mr. Price, except for the columns at the entrances, colour does not affect these. Practically the same horizontal divisions of the height were made by Mr. Price as by Mr. Ellis. In both there are "base," "shaft," and "capital" treatment—a base consisting of three storeys, in the lower of which are the three arched entrances in each case; a high shaft with wide strong-looking corners; and all the windows exactly alike except for a narrow band of ornament and circular windows in the one case, and arched window-heads and a band of dark-coloured stone in the other. In both there is a slight entasis, from a vertical base about 10ft. high at the ground storey—in the one to the top of this band only, in the other all the way up to the base of the pyramidal roof. Above this band, again in both cases, there are two storeys, then another horizontal band which is the height of one storey; there follows what in most towers of the town hall or church type would be the belfry, composed of three storeys of offices (in the "Sun" tower these are under the colonnade), then another storey forming a frieze, over which the arched heads of the windows in the Minneapolis manner, shown in dark stone, correspond in value with the shadow under the main cornice of the design for the "Sun." In the former, however, the roof slope commences immediately above this level, but in the latter there remains a three or four-storey attic stage, crowned by a cornice and surmounted by a pyramidal roof with a small lantern topped by a bursting sun.

In this design Mr. Price doubtless gave the building an entasis for the double



STUDENT'S PRIZE-WINNING DESIGN FOR A SAVINGS BANK. PLAN, TYPE B. JOHN RUSSELL POPE, ARCHITECT.

reason of apparent strength—to counteract in some degree the optical illusion which results from a high vertical line—its appearance of leaning outwards towards the top—and obtaining room within his own boundary line for his projecting colonnade, which forms the principal feature of the "capital." This colonnade—which would be in reality a mere screen—was provided for in two ways, first by setting back the wall line above the twentieth storey, and secondly by corbelling out the main wall faces through the eighteenth and nineteenth storeys, a scheme that would have been both very picturesque and very expensive. The third, seventeenth, twentieth, and twenty-fourth storeys were to be provided with small circular windows, a scheme that was objectionable because it has been proved that offices with such windows cannot be easily let. The design was not carried out, but it may be considered as an interesting study, and as representing a beginning which has led to many of the most satisfactory steps towards the solution of this difficult problem. It has served as a precedent upon which Mr. Price based his fine design for the American Surety Company's Building at Broadway and Pine Street, which won the competition against a strong field—a competition which brought out many interesting ideas.

In this design (p. 532) Mr. Price eliminated the unpractical features of his first study, and lost some of its picturesqueness in consequence. The colonnade in the upper part was suppressed, and a row of pilasters extending through two storeys only was substituted; all the circular windows, with a single exception, gave place to practical square ones. Instead of the square lantern stage and pyramidal roof, there was only a screen wall pierced with circular openings, and capped with a cheneau rising above the main cornice; all of which tended to simplicity and added to the monumental character of the design. The most important change, however, was that of carrying down to the ground level the vertical lines of the masonry between the windows of the upper storeys, instead of the triple-arch treatment, in which the design of St. Mark's had been followed to a degree that was unsatisfactory both in design and for practical service.

In the execution of this design some changes were made. One that has considerably injured the design has been the change from the screen wall above the cornice to a two-storeyed attic. This alteration, which was made shortly before the completion of the building, so that the architect had no opportunity of thoroughly studying the change, can only be regarded as being most unfortunate. There seems to have been a doubt in the mind of Mr. Price as to whether the upper storeys ought or ought not to be crowned with the principal horizontal line. It was probably too late to suppress or reduce the main cornice as already designed, and a small cornice to the attic seems to have been felt by the architect to be inadequate. Accordingly, the cheneau was increased in size, and the upper cornice brought into competition and discord with the one originally designed. These peculiar circumstances should, in fairness, be taken into account in criticising the design, in which the architect's ideas were obviously frustrated by unforeseen contingencies.

Type the First.

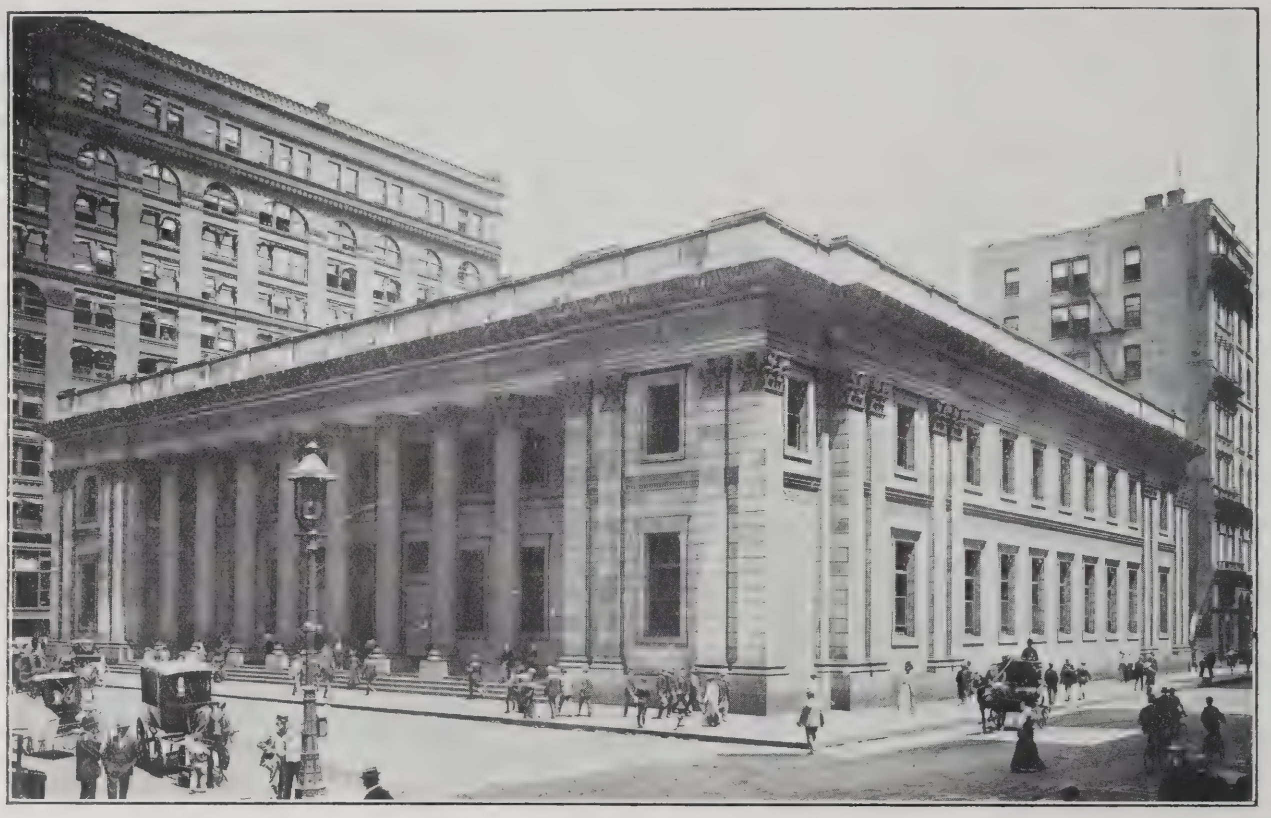
This building (p. 532) may be said to have created the first of the two types of office-building design to which reference has been made—that which is based upon the principle of the Roman column with base, shaft, and capital, there being three principal horizontal divisions. To this type belong the Flat Iron building by Burnham (p. 533), the Empire Building by Kimball and MacIntosh (p. 533), Broadway Chambers by Cass Gilbert, and the Hanover Bank Building by Baker and Ayers (p. 534); and, more picturesque but less logical and less typical, the fine marble offices of the New York Life Insurance Company in Broadway by McKim, Mead, and White, with details which for refinement and richness can be equalled only by the finest palaces of Europe.

New York Life Insurance Building.

The building of the New York Life Insurance Company in Broadway, New York (pp. 534-5), is not altogether typical of one of the forms of solution generally sought. Theoretically, it is unsatisfactory because its treatment is that of three or four buildings of three storeys each piled one upon the other; an order runs through two storeys in each horizontal division, while the third storey raises a doubt as to whether it was intended for an attic or for a pedestal. The objections, however, lose much of their force upon close examination. If we accept as an artistic solution of this difficult practical problem (which is that of a huge box full of offices all precisely alike, requiring for each office a window precisely like every other window in the building) the type of exterior treatment to which all the previously noted examples belong, we may suppose (and it is actually the case), that in several of the designs following the treatment of the accepted type the large halls, restaurants, etc., do not exist. If, then, we continue to accept any variation in the design of a *motif* where there is no variation in its functions, we must be accepting it for a reason other than because of logical expression of the plan—principally,

THE FIRST NATIONAL BANK OF PITTSBURGH
ORGANIZED
THE FIRST NATIONAL BANK OF PITTSBURGH
BUILDING

THE FIRST NATIONAL BANK OF PITTSBURG. D. H. BURNHAM AND CO., ARCHITECTS.



THE ILLINOIS TRUST COMPANY'S BUILDING, CHICAGO. D. H. BURNHAM AND CO., ARCHITECTS.

perhaps, because a horizontal division, or tie, at some short distance below the cornice, is felt to be needed to give ocular stability to these high structures; and it is only for the same reason that a similar division is made near the base, though in most cases the two lower storeys are occupied by banks or offices with special requirements. In this building there are three principal horizontal divisions, consisting of three storeys in the lower, seven in the middle, and three in the upper. Above the lower division there is a bold projecting cornice, surmounted by a bronze balustrade. A storey below this there is another horizontal band, consisting of an entire entablature, which breaks over a hexastyle columnar entrance above which are a marble balustrade with exquisitely detailed lamps continuing the vertical line of each column, and a charming group of sculpture over the two central columns. The group represents a mother eagle with its strong wings outstretched over a nest of young birds, admirably symbolising the idea of protective insurance. The fourth storey serves as a pedestal to the two-storey pilaster order above it. The seventh may be regarded as an attic storey above the same order. The tenth storey serves a like purpose to a like order, running through the eighth and ninth storeys. The effect of this treatment is that of bands running round the shaft, and serving a purpose purely decorative, much as do the bands around the shaft of the fine Column of July in the Place de la Bastille in Paris. In the upper division or "capital," two storeys are marked by a pilaster treatment similar to that in the storeys below, but the third storey (13th) is composed of semi-circular windows, the archivolts of which spring from the capitals of these pilasters. These three storeys are in effect only one, and the divisions below the arch appear as mullions and sashes rather than as individual windows. The whole is crowned by a magnificent cornice and balustrade, above which rises a kind of tower, consisting of a pedestal supporting a square lantern structure with four dials. This lantern is surmounted by a colossal group of bronze figures supporting a globe, from which an enormous spread eagle seems always about to fly. Externally—and internally as far at least as the splendid banking-room and vestibules are concerned—it is the perfection of the detail which captivates one, as well on account of the judicious placing and fitness of the ornament to the member or space which it decorates as because of the remarkable sense of scale everywhere felt and produced. It is hopeless to attempt to convey anything like an adequate idea of all this by means of photographic reproduction; only a very large photograph, and one taken from a position which it would probably be very hard to secure, could include the whole of such a building and also show something of its detail.

First National Bank, Chicago.

The impossibility of adequate representation is even more evident in a case such as the First National Bank in Chicago (p. 535), by Burnham and Polk, where both height and ground area are extensive, while the building stands upon comparatively narrow streets. This, again, is a remarkably fine building, which, however, must be seen to be fully appreciated; a great mass which rises sheer from the street as the cliffs do from the water at Dover. The proportions and detail of the cornice, and the few projecting base lines, are extremely well studied; and in spite of—perhaps even because of—the honeycomb of windows, the whole is monumental and dignified in effect. Nowhere, however, is the imagination allowed to run away with reason. Every office is planned just as it should be, expressed just as it should be, while the lines of steel stanchions and the girders between them are faithfully followed by the clothing of stone. Such a building comes as a relief among the commercial structures in any city, where one is apt to find almost endless elaboration, ostentation, and decoration; where the ornate and clever designs are so numerous as to be monotonous, and only the simple has value, by contrast, among them. Simplicity of scheme has, fortunately, been much sought during recent years in the designing of commercial buildings. Striving after complicated and "original" decorative effects in the treatment of the elevations has become less and less frequent; the "picturesque" has given way to the monumental, and the commonly accepted forms of decorative composition which dominated nearly all the earlier designs are being superseded by others of a more original—in the broad sense of the word—more vital character.

Some Earlier Buildings.

In order to trace this change, we must revert to some of the earlier buildings for comparison with later works. The view up Broadway (p. 536), showing the Manhattan Life Building in the foreground—one of the earliest of the high buildings—shows the storeys grouped in twos and threes, and the upper portion divided into towers and a dome. The façade is designed with reference to the sides, yet, apparently—since windows and an elaborate bridge, some two hundred feet above the pavement, are built in one side—it was not anticipated that another building of equal height might be built adjoining it. Beyond, in the middle distance, is the American Surety Building, already described. In this latter, each storey is clearly defined, and a single scheme of treatment is carried all round the building, while rights of light were arranged by treaty with adjoining owners. The whole exterior is of one colour and one material—in itself a very important step in the direction of simplicity.

Louis H. Sullivan.

Mr. Louis H. Sullivan, of Chicago, who, both by his work and his writings, has done much to create an inventive school of architecture in the States, seems to have been the first architect to glory in height, to have no desire to conceal or break up that height, but rather to emphasise it in his designs. His Wainwright Building, St. Louis, Missouri (p. 537), was probably the first example of the steel-frame structure in which prominence is given to the lines of stanchions and to the girders between them, and where the only ornamentation follows these structural lines. This is a building of but moderate height, being only nine storeys; above is a storey which is included in the fall of the flat roof, which latter projects boldly over the wall and protects the fronts from the rain. This storey contains the heating circuit, ventilating apparatus, storage tanks, etc., and is treated as a frieze, executed, together with the cornice, wholly in highly ornamented terra-cotta. Approximating in width the height of this frieze, the strong-looking corners—which, however, by their very slight reveals, proclaim a steel frame behind—and the broad bands of surface above and below the first-storey windows, frame-in the light lines of the mass of the building, and serve to satisfy the eye as to the stability of the whole. The two lower storeys—ground and first floors—are given up to shops, and these storeys are executed in a covering of red sandstone. The remainder of the projecting shell of masonry is of dark-red brick, which matches perfectly the ornamented terra-cotta. There is no pretence that any of this masonry shell is structural. The slender dimensions of the supporting piers, the ends of the thin courses of stone, the slight reveals, all indicate frankly that this is a construction

KNICKERBOCKER TRUST BUILDING, BROADWAY, NEW YORK. McKIM, MEAD, AND WHITE, ARCHITECTS.

KNICKERBOCKER TRUST COMPANY, NEW YORK CITY: BANKING ROOM. McKIM, MEAD, AND WHITE, ARCHITECTS.

f steel, and is merely clothed or protected against fire and the elements by the thin masonry case which surrounds it.

There are many other points of interest to study as regards this building, as in the way the details have been treated—apart from their singular originality—such as that the ornament upon the stonework is all carved into, and that upon the terracotta is modelled out from the main surface of the material. Also, that the ornament, which is so slight in its projection in the lower storeys as to seem almost the natural texture of the material from which it is cut, increases gradually in projection the farther it recedes from the eye. It may be objected that the alternate piers in this building do not contain a stanchion, but are as large in their dimensions as those which do. Obviously this arrangement was adopted with the object of preserving the unity of the design, and of exaggerating the apparent size of the structure by the effect of multiplicity of a single motif.

In his late designs, such as the Condict Building in Bleecker Street, New York, Mr. Sullivan has obviated nearly every criticism which may be made upon rational grounds, and here also may be seen some of the most highly interesting of his marvellously complex and fascinating ornamental detail. (Pages 538-40.)

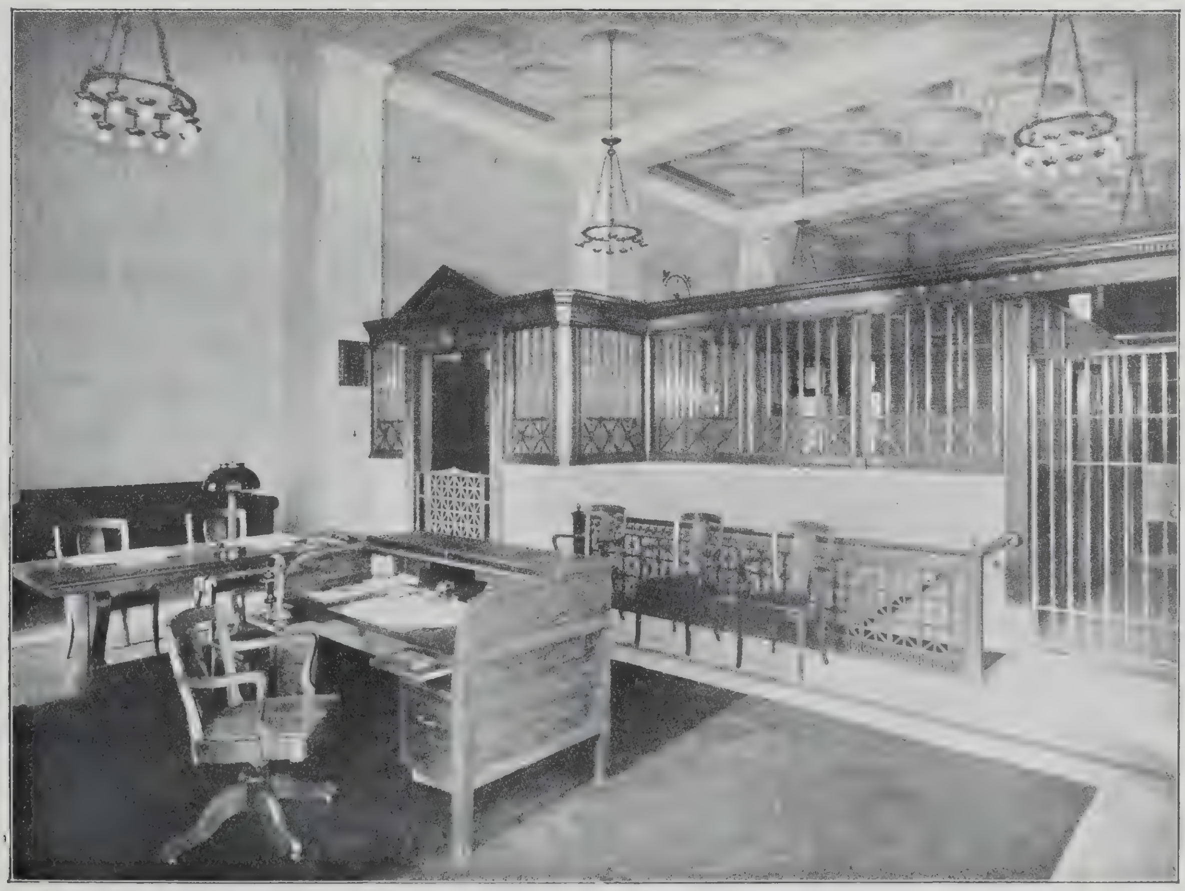
Among the best of the picturesque examples which were characteristic of the work of ten to twenty years ago, may be mentioned the buildings of the American Baptist Publication Society, by Frank Miles Day, and the Harrison Building, by Cope and Stewardson; the City Trust Building, by Wilson Eyre, in Philadelphia; the Fiske Building, by Peabody and Stearns, in Boston; the Wolfe Building, in Maiden Lane, by Henry Hardenbergh, the "Mail and Express" Building in Broadway and Fulton Streets, New York (pp. 539-42-43); this last building, the work of Carrère and Hastings; is especially interesting on account of the extreme narrowness of the Broadway front, which is only about twenty-five feet wide, and the very great difficulty of treating such a façade, which must be almost filled with windows, and six or seven times as high as it is wide. In this case the architects have produced a decorative treatment which is immensely clever and sprightly; they have tossed to the winds all theories which demand expression of the plan upon the façade or call for the limitation of ornament to the decoration of constructive parts. There is no suggestion of the iron structure of the building; there is only a plain wall of stone with openings for light, or where required to assist the decorative balance. The decoration is constructed outside of and upon the wall which serves as a background; it starts with four caryatides supporting a broken straight pediment, through which rises a framed, curved-pedimented window, at the sides of which the wall behind is rusticated and forms a pedestal storey to two superimposed orders, each running through two storeys. Above the upper tier, the seventh storey is treated as an attic. This again has a broken and curved pediment, from the tympanum of which projects the small balcony to an arched window adorned with Corinthian columns at each side, and covered with a pediment; the windows at each side of this large one, and those in the storey above, are comparatively plain, and between the windows very flat pilasters extend through both storeys, and terminate in cartouches under an elaborate cornice with a richly detailed cheneau, which serves as a railing to the balcony thus formed above this cornice, which is in effect the principal cornice to the building. The next storey, which is a high one with an arched central opening and double columns at each side, is in the nature of an attic to the whole structure; but there is an attic to this attic, having a pediment in the centre with a rich cresting. The ends of the side walls extend above this, and terminate as a sort of plinth to pedestals supporting elaborate vases. The building is finished with a high square mansard, from which rises a light and graceful octagonal tower of two principal and two intermediate stages, carrying a flag-pole and weather vane. The transition from square roof to octagonal tower is managed with the cleverness which characterises the whole design.

The simpler and less successful façade on Fulton Street is open to much the same sort of criticism (but not in the same degree) as the Manhattan Life Building, and on the whole this building leaves much to be desired. It adds nothing new to architecture, and it avoids rather than helps to solve the problem which the office building presents. In their essay in the competition for the American Surety Building, the same architects struck a much higher note, and the design of those storeys, which may be termed the "shaft" of the building, has had a material influence upon many of the designs which have lately appeared. Their Blair Building, New York, a still later study, in which bays of iron, separated by narrow piers of stone, are crowned with a bold projecting cornice cast in iron, is one of the most successful of all the designs which have thus far appeared among those which may be considered as being dignified by the inspiration of a conceived ideal.

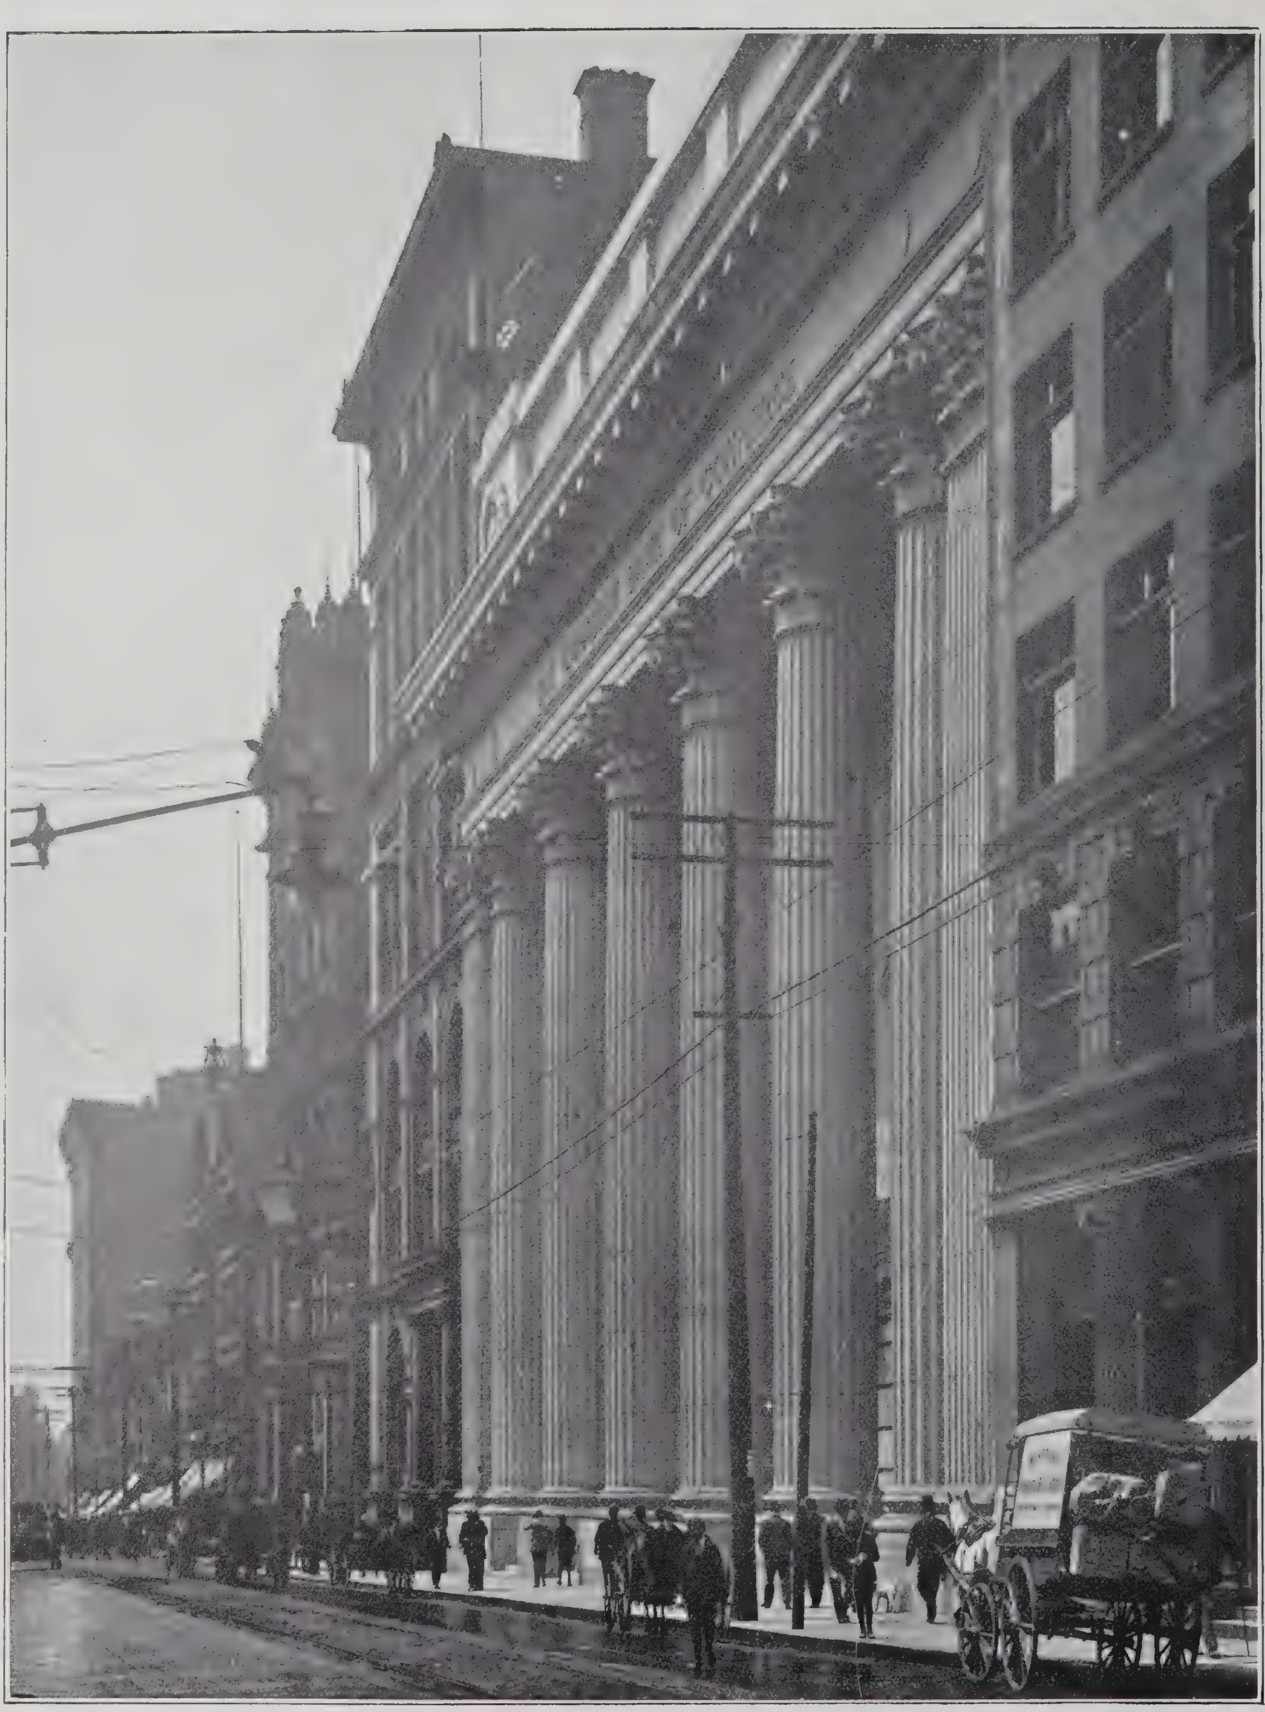
Ernest Flagg and the Singer Building.

Mr. Ernest Flagg, in his design for the Singer Building, built ten or twelve years ago, adopted the expedient of a colossal window treatment extending through two storeys, and has so divided this building horizontally—by the employment of a projecting balcony, which partly screens the fourth storey, and by a heavy cornice, which includes a storey between its consoles, with a balcony rail above it, which also screens the ninth storey—that the first impression created is that it is composed of four or five giant storeys, an impression which is further strengthened by the combination of red brick with black mortar joints, and by the white stone in which all architectural features are executed. The detail (p. 543) is strong and clean, and very monumental, but the design is at fault in suggesting large halls where none exist. Less impressive, but more satisfying to the analytical mind, is his Produce Exchange Bank Building, at the corner of Broadway and Beaver Street, in which the only lines that are not constructive are two balconies, one in stone and the other in iron, which divide the height into contrasting horizontal and vertical rectangles. It is an ironical circumstance that Mr. Flagg—who, perhaps more than any other architect in the United States, had for some fifteen years persistently condemned the high building altogether—is the architect of the highest completed commercial structure in the world—the tower, 609ft. high, and containing forty-one storeys, of the new Singer Buildings.

The tower of the recently completed Singer Buildings is treated as a great campanile, and finished with a dome, and a tower at the corner of Madison Avenue, Twenty-fourth Street, will complete the buildings of the Metropolitan Life Insurance Company on the site reaching from Twenty-third to Twenty-fourth Streets, and from Madison Avenue to Fourth Avenue. This building or group of buildings (p. 545), if which the first portion—at the corner of Madison Avenue and Twenty-third Street—was completed some twelve years ago, is extremely elaborate in its details, which are studied from the most florid examples of the Renaissance in Spain. It was designed originally, by Le Brun and Sons and Masqueray, to be carried out in terra-cotta, but the owners changed the material to white marble. This building, the tower of which is to be forty-six storeys (660ft.)



KNICKERBOCKER TRUST BUILDING: OFFICERS' ROOM. McKIM, MEAD, AND WHITE, ARCHITECTS.



THE CANADIAN BANK OF COMMERCE, MONTREAL: GENERAL VIEW OF THE EXTERIOR. FRANK DARLING, ARCHITECT.

high, faces Madison Square at its south-east corner, the tower being at the corner of Twenty-fourth Street; at the north-east corner (Twenty-sixth Street) is the Madison Square Garden, with its tower 350ft. high. The tower of the former structure, like Mr. Price's design for the "Sun" building, follows in its principal lines those of the former campanile of St. Mark's, while the latter is a lighter and graceful restudy by the late Stanford White—Italian Renaissance in the style of its details—of the Moresque and Renaissance combination which makes up the beautiful tower of the Giralda at Seville. Between Twenty-fourth Street and Twenty-sixth Street is a row of structures of but a few storeys—two to four or five—among which is the splendid Madison Square Presbyterian Church.

Some Speculative Buildings.

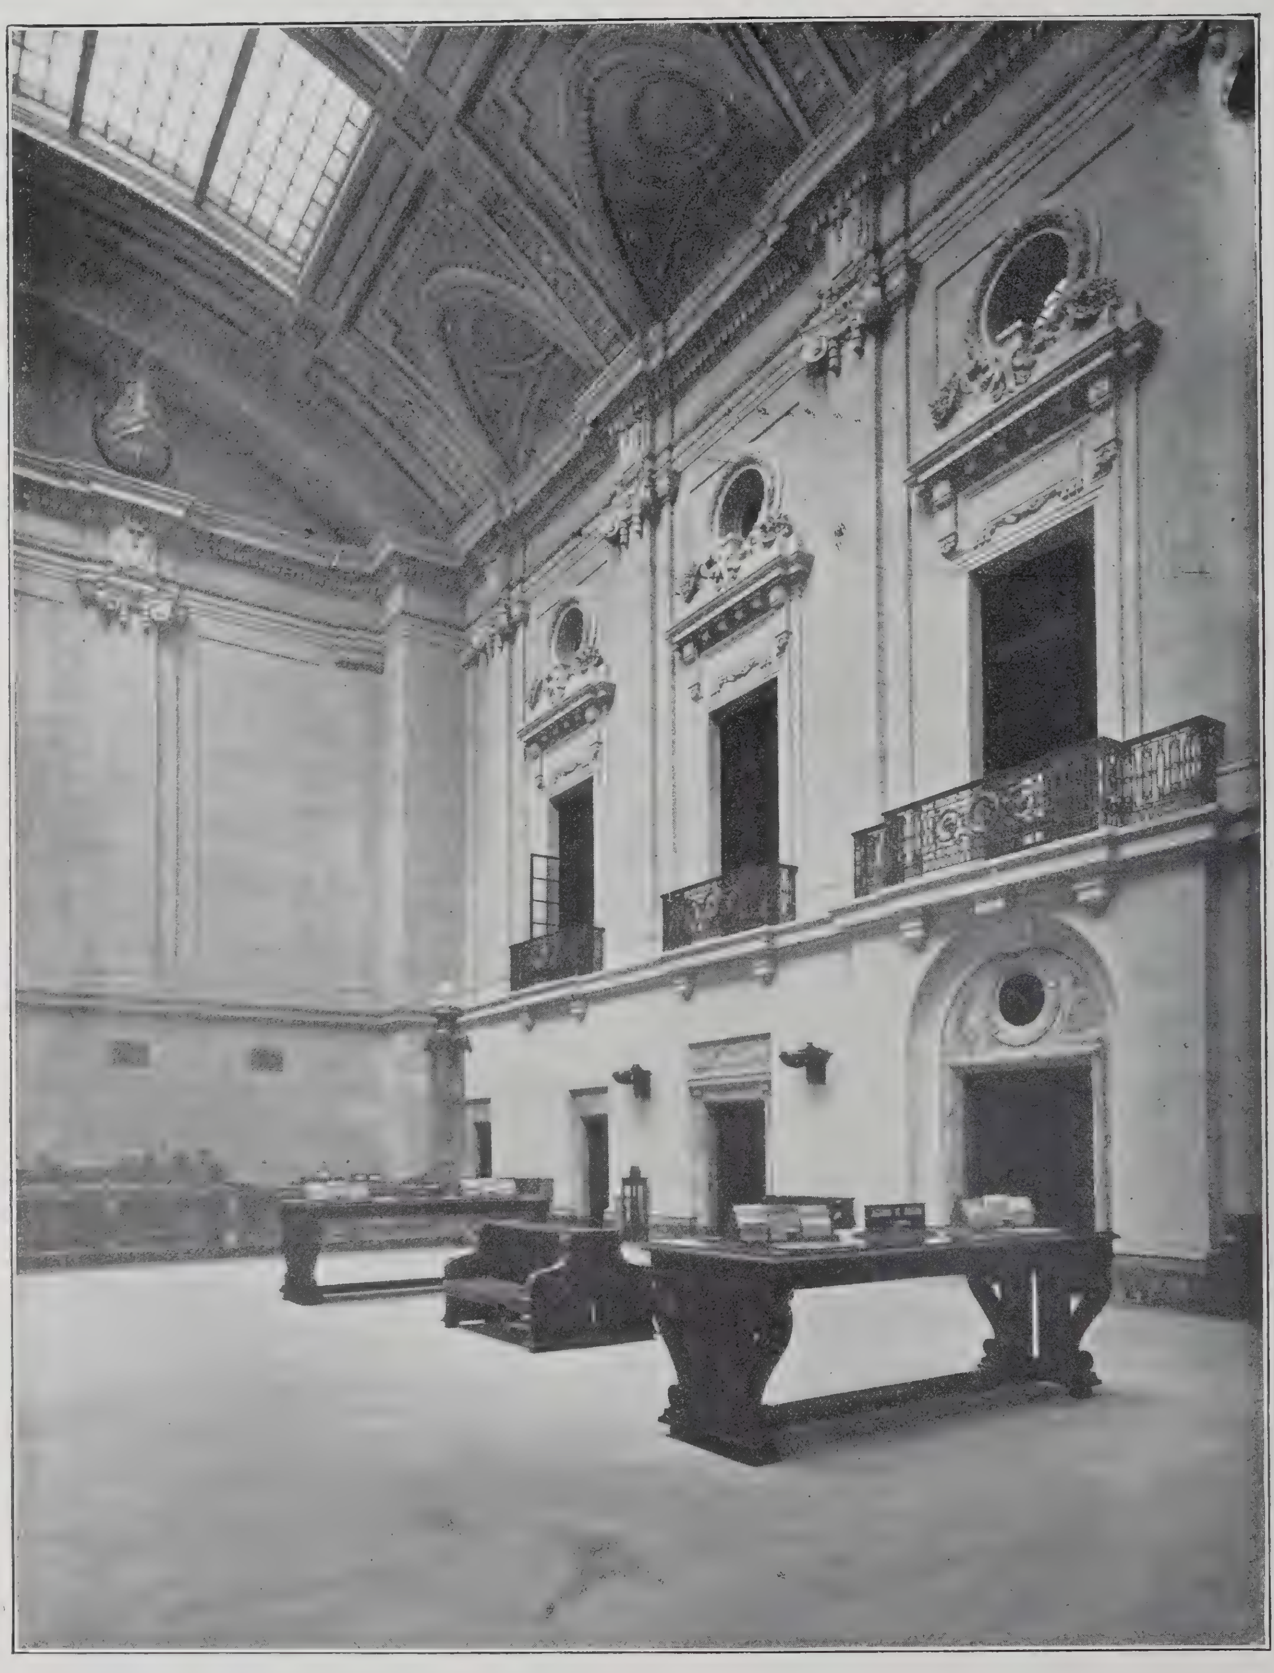
So long as very large commercial companies continue to come into existence, no doubt also will very high buildings continue to be built within certain restricted areas in commercial centres in America. Whether such structures as the Singer Tower (p. 585), with such a small ground area (it is only 65ft. square, or thereabouts), will prove practical office buildings for the large companies, must be regarded as doubtful; but similar towers will probably in the future provide space for the brokers and professional men, who do not require great floor space, and thus relieve much of the competition for ground area in the congested districts, making it possible for the banks, exchanges, and smaller companies to have their offices in their own buildings, an object which is desired by nearly every good business institution, but which, with the present high value of property in lower New York, can seldom be attained. One may see at the extreme southern point of the island (p. 546) a number of examples of the buildings erected by speculative companies for letting. One might consider the old Washington building at the Battery as a safe conservative investment, and the building as being not devoid of architectural interest. The Bowling Green Building, which adjoins, is one of the early examples of the speculator's work, while the West Street building is one of the latest and most degenerate. It is these latter which it may be hoped the tower type will ultimately supplant. The new Customs House, designed by Mr. Cass Gilbert (p. 587), also at the Battery—cannot, we imagine, fail to create an influence for the better upon the architecture of the houses of the more conservative institutions in this locality.

Lights and Shadows.

As examples of the lights and shadows of the high-building question, the Wolfe Building, New York (p. 542), by Mr. Henry Hardenbergh, which enlivens a dull and monotonous neighbourhood, may be taken as belonging to the former, while the Frick Building in Pittsburg falls under the latter category. The Frick building has been built directly opposite the principal front of the celebrated Court House, which is one of Richardson's greatest works—perhaps his masterpiece.

As to the interiors and finish of these high buildings, the ordinary offices are

THE CROCKER-WALWORTH BANKING HALL, CROCKER BUILDING, SAN FRANCISCO, CALIFORNIA. A. PAGE BROWN AND JULIUS SCHWEINFURTH, ARCHITECTS.



CANADIAN BANK OF COMMERCE, MONTREAL: INTERIOR OF THE BANKING HALL. [FRANK DARLING, ARCHITECT, extremely plain, without cornices, with direct radiators in front of each window, exposed lavatory basins in each room, sometimes built in what in this country would be called a "cupboard," but in the States is called a closet. The floors and doors and other joinery are usually of oak, occasionally of mahogany, and are almost invariably finished with a dull polish. The door furniture—plates, handles, latch, and lock—is all combined in a single fitting, and black iron or bronze is usual, brass being seldom employed and copper almost unknown. The corridors and stairs, and all halls or other places used by the public, are of marble White marble floors, and four or five feet of the walls are wainscoted in the same material for the corridors, and marble mosaic floors, often beautifully designed, with the walls treated in coloured marble panelling, may be taken as the rule for the entrance, lift, and other principal halls. The elevator (lift), screens, balustrades, counter-grilles, ventilating registers, etc., are of black iron, bronze—often with a beautiful green finish—or brass, but nothing if not rich and elaborate in design (p. 574). The principal rooms, such as the banking, dining, directors', etc., are at least pretentious (see pp. 566-7-9), though often above that description. Rich material, excellent workmanship, carvings executed by skilled artisans (from highly finished full-size details made in the architect's offices), elaborate and well-studied plaster decorations—especially the ceilings—are characteristic. Occasionally painting, sculpture, and stained glass, by the ablest artists obtainable, are also introduced. Yet that any of this work is likely to be preserved for its beauty is improbable. Much of it is doubtless worthy of preservation, but to anyone who knew the fine new waiting-room of the Grand Central Station in New York, and its brief existence, it will seem improbable that any commercial structure is not in danger of demolition at the end of a few years to make way for "improvements."

Insurance Buildings.

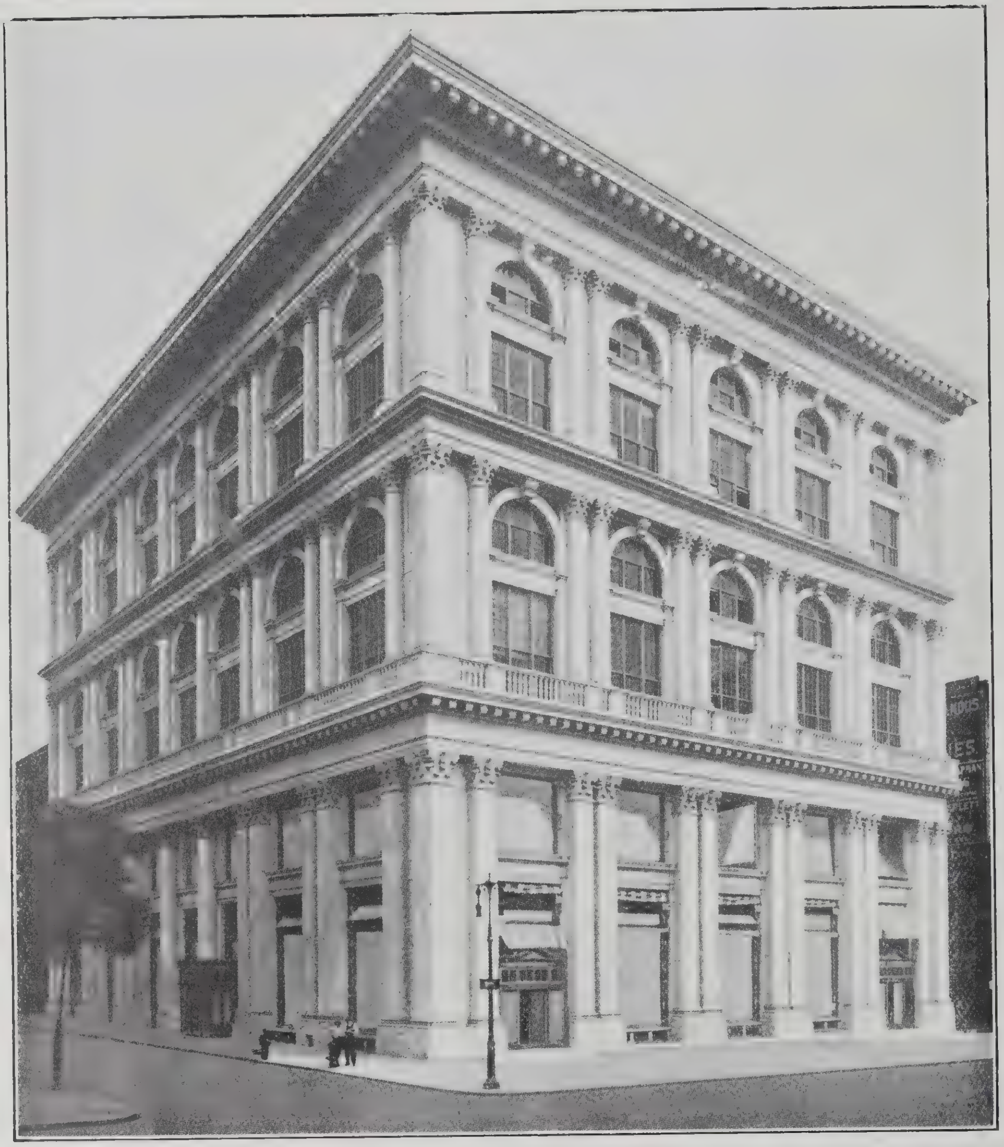
Architecture as a means of advertisement is well known to and understood by the insurance companies, and many of the best examples are due to this recognition. A fine building—one that gives the impression of judgment and taste upon the part of the directors—imparts the idea of stability and strength as a sound financial institution to the ordinary policy-holder far more than a huge list of figures which he does not pretend to understand. One sees in the huge tower of the Metropolitan Life Building in New York, and the enormous group of Prudential buildings in Newark, this striving after the attention of that section of the public who insure with the "industrial" companies. The same may be said of the proposed sixty-odd storeyed juggernaut which Burnham and Co. have planned for the Equitable of New York, though in this case the advertisement will appeal to many as being a questionable asset. Surely one must feel more confidence in a management which keeps to such simple, strong, and conservative buildings as that of the Mutual Life new building by Mr. George B. Post, in Newark (p. 546), and the American, by Mr. Gilbert, previously mentioned, also in Newark. Although the number of small office buildings in New York occupied wholly by a single company, may not, from the unobtrusiveness of such buildings, appear to be very large, they are in fact very numerous, for here and there throughout the city one comes upon some little building, such as one might expect to find in an old European city—quiet in design, built for a practical purpose without desire of blatant advertisement, and without stint. Pleasant it is to come upon such a building as the offices at Broad and Pearl Streets, by Mesrs. Kirby, Petit and Green, with its agreeable interiors, finished in natural wood.

Small Office Buildings.

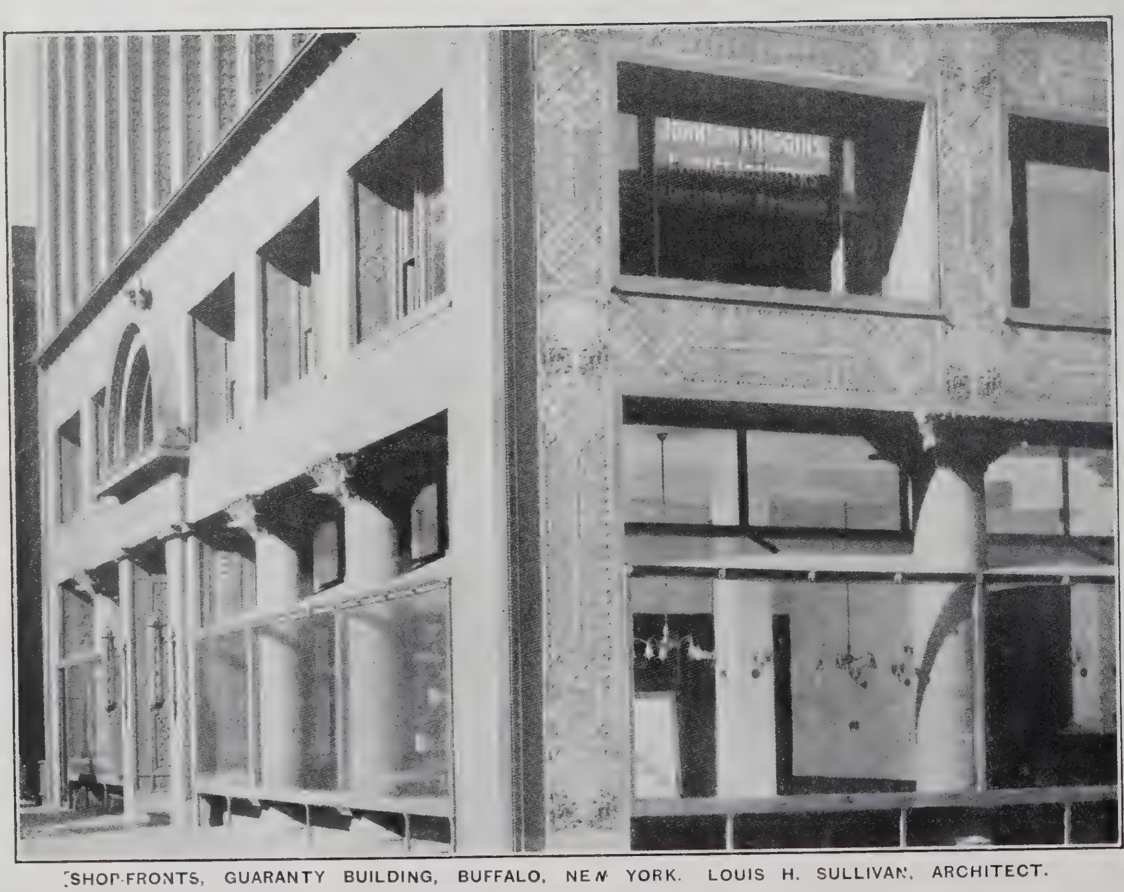
In other cities, as Baltimore, Philadelphia, Boston, etc., these small office buildings are not infrequently among the most interesting of the town's architectural ornaments. The little building at Walkerville, Canada, opposite Detroit (p. 548), is the most important architectural work in the town, while the charming detail of the sprightly offices of a piano company in Boston could not fail to attract the attention of any lover of good architecture. (p. 550). The Metropolitan Insurance Building in Baltimore, by Messrs. Le Brun, is as appropriate to Baltimore as it would be to Bloomsbury (p. 545); and the little building containing the offices of Berry Brothers in Detroit gives life and colour, and brought about material improvements to a street which was formerly a muddy lane leading to a row of varnish manufactories.

The New York Stock Exchange (p. 602), designed by G. B. Post, between Broad Street and New Street, with a side entrance in Wall Street, was erected in 1901. It is built of white marble, and shows much originality in both design and construction. It was necessary to make

CANADIAN BANK OF COMMERCE, MONTREAL: INTERIOR OF THE BANKING HALL. FRANK DARLING, ARCHITECT.



TIFFANY BUILDING, FIFTH AVENUE, NEW YORK CITY. McKIM, MEAD, AND WHITE ARCHITECTS.



SHOP-FRONTS, GUARANTY BUILDING, BUFFALO, NEW YORK. LOUIS H. SULLIVAN, ARCHITECT.

the great hall in the Exchange as large as possible, and to provide it with the maximum amount of diffused light, and these objects were attained by making the colonnades at the ends of the hall on its two street fronts form the end design of the hall, with continuous screens of glass behind them. A full account of this remarkable building was given at p. 182 of the "Builders' Journal" for September 8th.

Banks.

The Mutual Benefit Life Insurance Building, Broad Street, Newark, another of Mr. Post's buildings, repeats the device used in the New York Stock Exchange of placing large free-standing columns in front of a glass screen. Here the columns are of the Corinthian order, and are four storeys high, supported on a base and crowned by an attic. The exterior of the building is of marble, with window screens of copper treated in imitation of bronze. The main façade is that to Euclid Avenue, where a colonnade of eight fluted columns carries a pediment containing some fine sculpture by Karl Bitter. The entire first floor is given up to the great rotunda-like banking-room and its dependencies. This room is 61ft. in diameter, and rises to a clear height of 85ft., and has a leaded glass dome. It is finished in marble and bronze, which produces a harmonious and rich effect.

Another fine classical design (by Mr. Post) for a bank is that of the Howard Savings Institution at Newark, N.J. (p. 547).

IV.—Shops and Stores.

Two things above all others are essential to a shop—floor space and light. If one of the two has to be sacrificed, it must be the light, because 100 sq. ft. of space will pay for several lamps, while one 25-c.p. lamp will light that area. But in America—where the law of easements as regards ancient lights is unknown, and a building must be so designed that it shall be sufficiently lighted regardless of how high structures on neighbouring property may be carried—small and ordinary sized shops depend for daylight almost entirely upon the amount to be obtained from the street in front and the alley at the back, and if this fails, electric lamps must supply the deficiency. In the larger shops there are, of course, central light-wells or areas; in the old-fashioned ones these open spaces were the ordinary area surrounded by brick walls and having skylights formed over the ground storey. In the more modern ones, however, the French scheme of an open space running through several storeys, with a dome or glass roof at the top, is adopted, as in Altman and Co.'s store in New York, which is an early example, and consequently is not representative American architecture of to-day (pp. 580-1).

The American Shopkeepers' Needs and Notions.

Unlike the French shopkeeper, the American does not hang rugs and draperies over the balustrades and in the area in defiance of risk of fire, but reserves it as an agreeable, open, architectural feature, in which a fountain and palms are often placed, and sometimes an orchestra; and the effect is not unlike the Mexican or Spanish *patio*. It will be noted that in the illustration the shades are drawn to assist the photographer, hence the effect of darkness, which is the reverse of the actual effect, which is one of bril-

GORHAM BUILDING, FIFTH AVENUE, NEW YORK CITY.

ARC LAMPS: DETAIL.
LOUIS H. SULLIVAN, ARCHITECT.

liant illumination, whether by day or night; and the effect of a radiator placed around the lower part of a column is unpleasant to observe. Each floor is open throughout its whole extent—that is to say, it is never divided into small compartments by brick walls, as required by the Building Acts of London. Fire protection is afforded by automatic alarms and sprinkling devices; ready access to all parts of the building, ample aisles between the counters, plenty of entrances and exits, high ceilings and mechanical ventilation—which can be relied upon to be working—make it easy for firemen to cope with a small fire, provide means of escape for employees and visitors, and reduce danger from smoke to a minimum.

The height of storeys is usually from about fourteen feet in the upper storeys to as much as twenty-five feet in the ground storey, and the skylights are provided with wire-glass and arranged on rollers to open automatically in case of fire, as well as in the ordinary way under usual conditions. What few partitions are required for offices and special departments are principally of glass and iron, or bronze grilles and frames; show-cases are entirely of glass, and stand upon metal bases. Staircases and lifts—there are often several of the latter—are entirely of incombustible material. The stairs—risers, treads, and inside skirting, and the walls adjoining, when the stairs are not free-standing—are of marble, the outside strings and newels of ornamental cast-iron, and the stair railings or balustrades of cast or wrought iron. Floors of marble mosaic or rubber tiling and metallic shelving are employed in the latest structures, and only the counter-shelf and hand-rails to the stairs are of wood. Window frames are of iron or bronze, doors of glass and iron or bronze.

The Planning of Shops.

As regards planning, in the smaller shops of the "sandwich" type—that is, the narrow lot between two others with a frontage to one street only and the back to the "alley" (a narrow roadway between two streets provided for the use of the dustman and delivery vans), there is but one aisle, and the front door only is used by the visitors; but the back door, used for the reception and dispatch of goods, could be used as an emergency exit. Whenever possible a complete circulation is desirable, and an experienced shop manager will invariably insist upon it if there is the opportunity. By a "circulation" is meant a complete "ring" of aisles so arranged that when a visitor has passed down one aisle he or she will follow a turn and go out by another. "Dead-end" aisles are, as they ought to be, discountenanced; ground-floor aisles with only a stairway to another storey at one end should be considered as having dead-ends. In shops of the "popular" class, occupying a corner site, entrances are usually arranged away from rather than at the corner, as it is considered desirable to have a long series of shop-fronts unbroken by entrances, and the latter are only introduced at a corner when the frontages to both streets are extensive and three or more entrances can be used to advantage. Most of the very large shops occupy the half or whole of a city square; thus the Marshall Field retail store in Chicago is about one hundred and fifty by nearly three hundred feet in ground dimensions, and is thirteen storeys high. In such a building, unobstructed by cross walls, and with the columns spaced about twelve feet apart in one direction, and twenty-two the other, with two great open wells about forty by

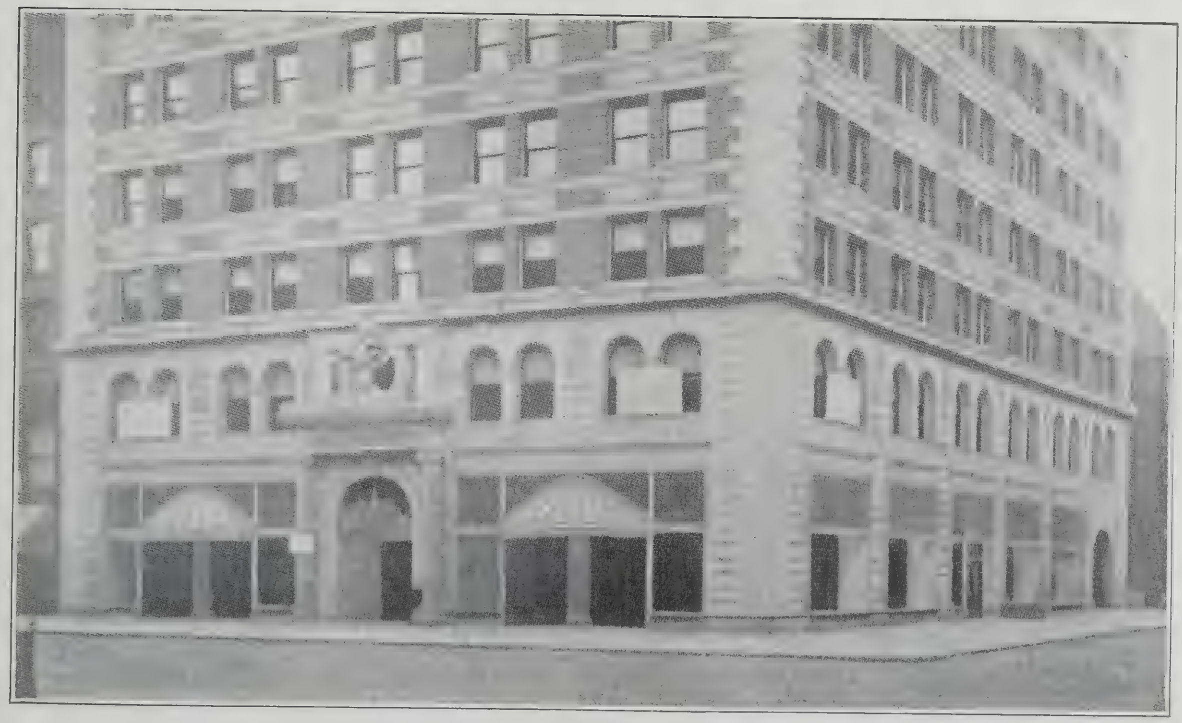
SCRIBNER'S BOOK SHOP, FIFTH AVENUE, NEW YORK CITY. ERNEST FLAGG, ARCHITECT.

sixty feet, and all the storeys high and the aisles wide, circulation is as easy as in the streets outside, and the open effect is almost that of a great market. Twenty-six pairs of swing doors and four revolving doors provide means of entrance and exit to and from the ground floor, while three principal staircases, each seven feet wide, twenty-six passenger lifts, and six goods lifts, provide communication with the floors above and below; several supplementary staircases communicate with the basement.

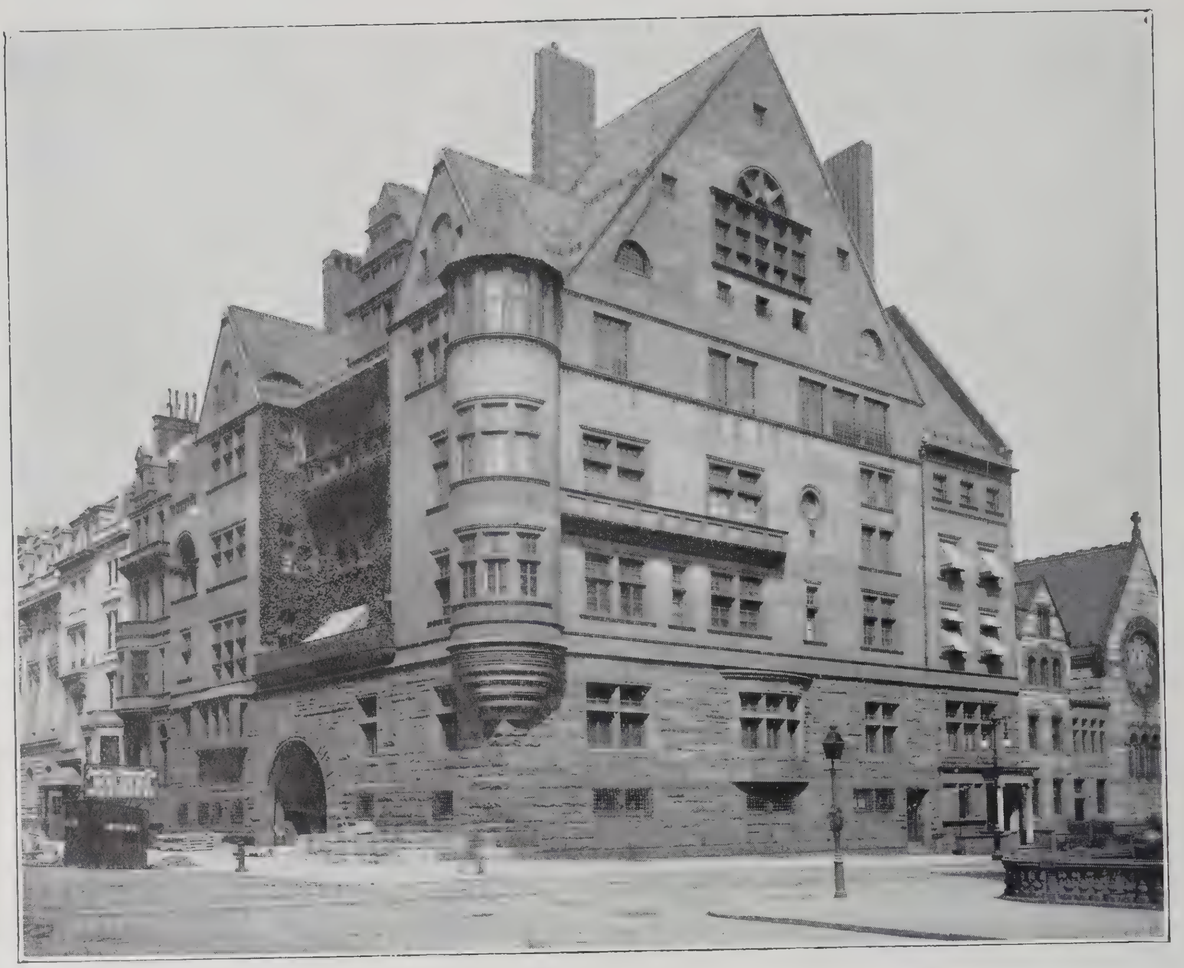
As architecture, this great pile is uninteresting. It is designed with no regard to beauty. Much the same might be said of the vast Wanamaker shops in New York and Philadelphia; and yet they are much better than such structures as the Siegel-Cooper shop in New York. Except for some of those recently constructed in Chicago, such as that for Schlesinger and Mayer, of which Louis H. Sullivan was architect, none of the "popular" class shops can be compared with the Magasin au Printemps or the Bon Marché in Paris, or some of the new shops in Berlin, nor with the Selfridge Building in Oxford Street, London. But with the more exclusive trades, such as the book, dressmaking, and silversmiths' shops, it is quite another matter.

Typical Shop Architecture.

The little shop in Forty-sixth Street (p. 574), used as a dressmaking shop, would hold its own in Mayfair, but is not in any sense quite typical of American shop architecture; but the shopkeeper can only be educated slowly. One of the earliest of this class of buildings to possess any architectural merit was the Scribner Building in Fifth Avenue, New York; one of the early works of Mr. Ernest Flagg, it would not be out of place in the Rue de la Paix. It was one of the first to express an idea as to the proper treatment of a masonry front, in which great holes must



SHOP-FRONTS, ST. JAMES BUILDING, NEW YORK CITY. BRUCE PRICE, ARCHITECT.



TIFFANY HOUSE, NEW YORK. McKIM, MEAD, AND WHITE, ARCHITECTS.

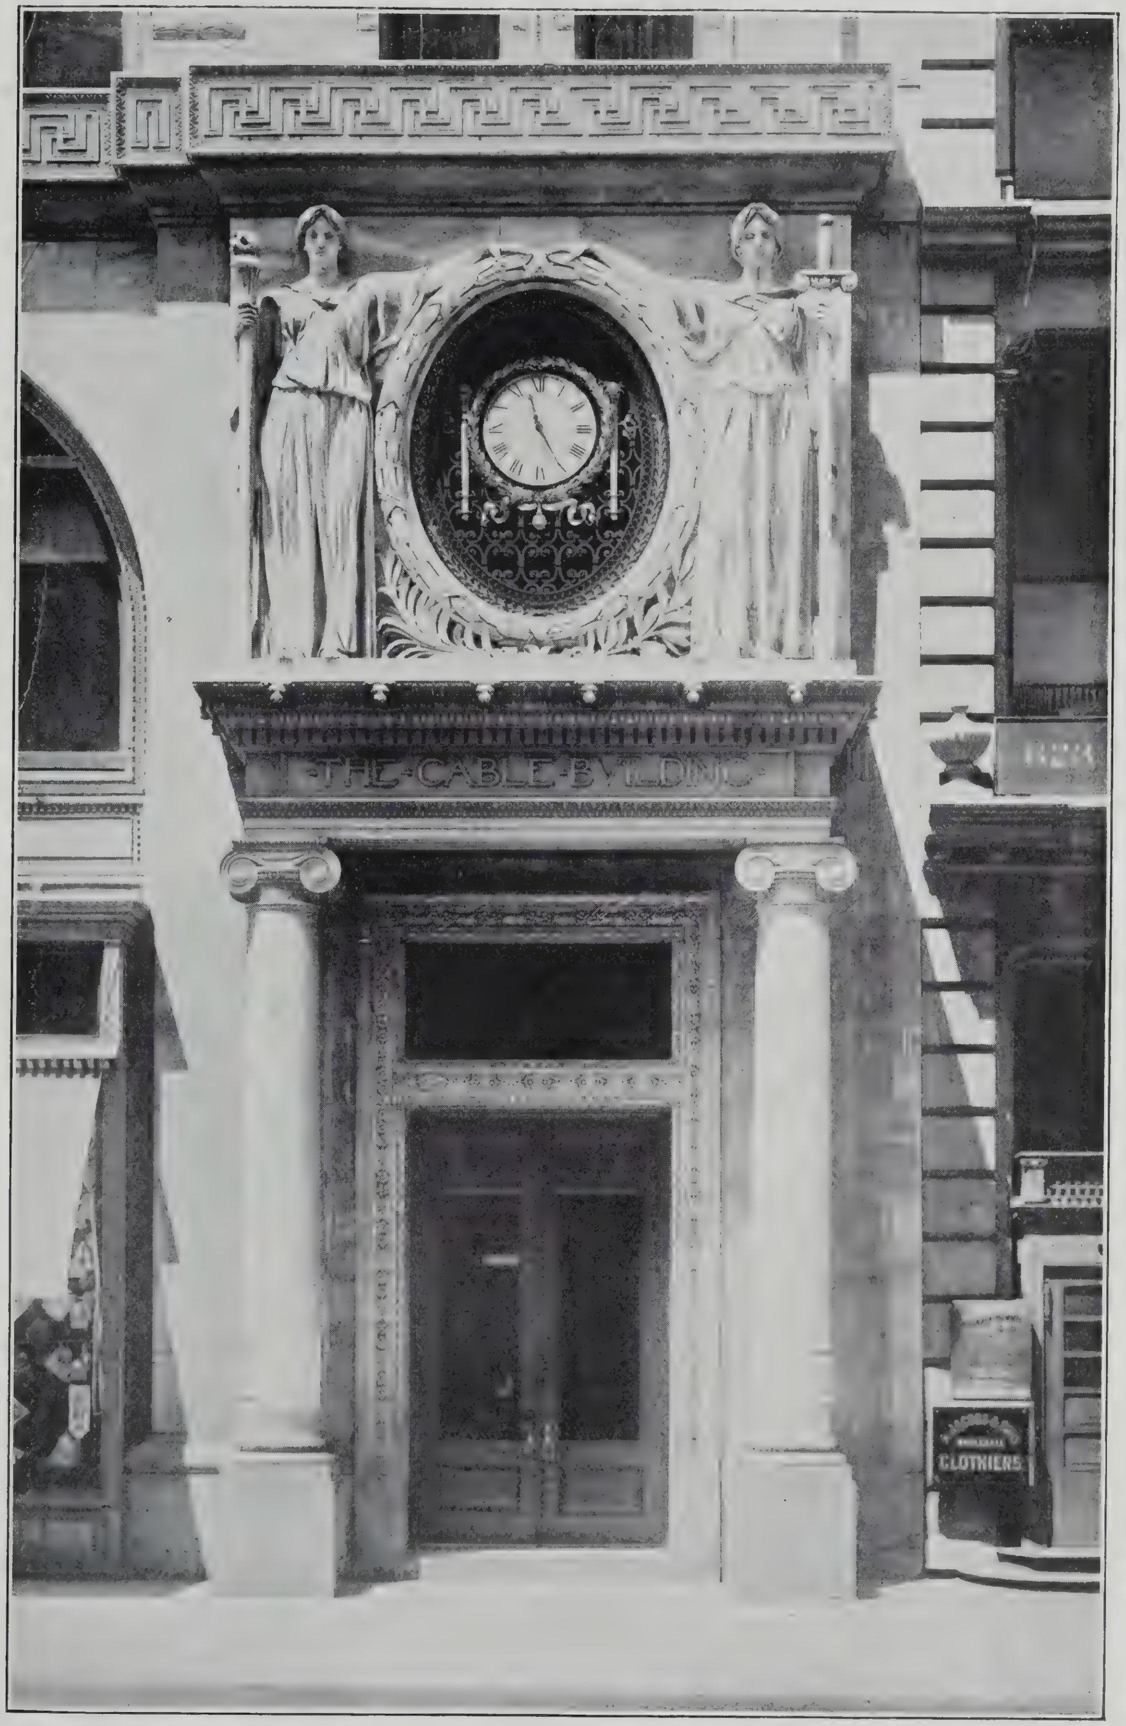
be made for light, and the largest of these holes in the ground storey. At each side of the shop-front, entrances to the upper floors are arranged in pylon-like masses of stonework, pierced with windows of contrasting proportions of height to width. The fourth storey is treated as a deep frieze, while the horizontal value of the first storey gives the impression of a truss spanning the shop-front, satisfies the eye if not the intellect as to strength, and has the appearance of transmitting the load placed upon it by the two piers between the second and third floor windows to the pylons of masonry at the sides. The horizontal character of the first and fourth storeys is effected in a very simple way. The windows to all floors above the shop-front are all the same size, but those of the second and third floors are treated in iron, and produce together the impression of one long opening. In the first and fourth storeys the mullions are of stone, and by thus breaking up the width of the void the effect of a deep lintel is produced. The eye is further appeased by the employment of a curved marquise, the outline of which is in effect that of a wide segmental arch, and its projection serves to distract attention from the lines of masonry which do not run to the ground, but are changed to small iron columns below (p. 575). In the St. James office building in Broadway the late Bruce Price adopted a similar expedient to avoid the effect of masonry walls "standing upon three sheets of plate glass"; but the marquise is designed as part of the glass in the shop-fronts—in effect an opened glass umbrella to which a stout column below appears as a handle (p. 575). A further development of the deep-lintel idea is illustrated in the building belonging to the Brigham Estate in Boston, designed by Mr. Stephen Codman, though in this case the iron supports below have the appearance of being temporary.

The Window Problem.

The demand for a great expanse of glass provides the real problem for the architect, and the modern methods of construction—the steel-cage and reinforced concrete—provide a simple practical solution. But the artistic treatment of such constructions is still in the process of evolution. Architects generally were for a long time reluctant to give up the effect of masonry construction, and upon the light lines of steelwork were built or hung by ridiculous little hooks thin slabs of terra-cotta, stone, granite, or marble arranged to represent arches, and courses of rusticated stonework that would put the fortifications of Sanmicheli to shame. Of rational designs in which the requirements of the occupant and the method of construction are both clearly expressed, an instance is illustrated by the Gage Building, Chicago, by Mr. Louis H. Sullivan (pp. 540-1). Here the lines of steel stanchions run from the ground to the top, and the girders are framed between them and clothed with dull glazed terra-cotta to protect the metal from fire and the elements, as required by the Chicago Building Act. Seven storeys used for exactly similar purposes are treated in an exactly similar manner. The greater width of the vertical lines at the sides is accounted for by the return or side walls; the wall above the top-storey windows marks the space required for pipes, and provides for the slope of the flat roof. The cornice does the double duty of protecting the façade from the elements and of providing a deep shadow which reduces the height of the horizontal band of terra-cotta, and emphasises the effect of a decorative "white" frame to the central mass of "grey." The shop-front is treated as something applied to the structure, as in fact it is constructionally. It is all glass in a cast-iron frame, and divided only by ornamental iron muntins. The thinness of the metal is redeemed by the character of the ornament, which is used for the purpose of stiffening and preventing buckling and getting "in winding" when taken from the moulds or cooling. The lace-like detail of this border and valance is immensely clever; the nice discrimination between the character of the two moulded materials (cast-iron and terra-cotta) and the different circumstances under which they go into the furnace is remarkably evident (pp. 540-1). One may at first sight wonder at the huge bunches of foliage at the top of the two lines of stanchions which, as decorative clasps to join the vertical and horizontal lines of the composition, are more conspicuous than necessary; but closer attention discloses that the foliage elaborates a large "mask." Mr. Sullivan is nothing if not an idealist as regards expression, and very possibly these masks were employed as a decorative symbol of the use of the wall on which they are employed; for this wall is itself a mask which hides such painfully utilitarian adjuncts to the modern buildings as pressure, storage, and expansion tanks, and the housing of lift machinery.

Varied Treatment of the Shop Front.

The shops in the Condict Building, New York (pp. 538-40), and the Guaranty Building, Buffalo, show another treatment of the shop-front by the same artist. Both are investment buildings, designed to be used for offices or for light manufactures as to the upper storeys, and for shops on the ground and first floors. The construction is even more apparent than in the Gage Building. The whole exterior of each is of ornamental terra-cotta, and the lines of stanchions run from the pavement level to the cornice. The continuous plate-glass shop-front is built outside the stanchions, or columns, in a metal framework which is so light as to be unnoticeable at a short distance (see p. 572). This looks like a practical compromise. It satisfies the merchant's demand for continuous plate-glass show-windows uninterrupted by structural piers, and enables the architect to maintain the apparent strength of his structure—that is to say, partially-



CABLE BUILDING, NEW YORK: DETAIL. McKIM, MEAD, AND WHITE, ARCHITECTS.

GIMBEL BROTHERS' BUILDING, NEW YORK. D. H. BURNHAM AND CO., ARCHITECTS.

because as soon as the shop is occupied the columns are "decorated" by the shop's window-dresser, with disastrous results to the effect of the architectural lines, which appear from the opposite side of the street to be broken off a few feet above the ground line. These buildings are more than ten years old; but, as already indicated, the shop-front as desired for the so-called popular class of trade has yet to be evolved. No great improvement, however, is to be recorded in later works, beyond these designs by Mr. Sullivan, which are quite as good as we may expect—until, perhaps, he creates a new type.

Many of the better class or merchant shop-keepers take a keen interest in architecture, and know enough to have their buildings designed by the ablest architects. Frequently when it becomes a question of sacrificing either the aggressiveness of the shop-front or the appearance of the whole structure, he will defer wholly to the advice of his architect. That the architect has plenty of opportunity to indulge his fancy as to detail will be evident from some of the details of Mr. Sullivan's work (pp. 573-4). As to the more exclusive shops, the sites chosen are usually in such positions—most often on a corner—and of such dimensions that the last square foot of glass is not a leading consideration.

Novelty of effect is not desired; good permanent decorative (preferably Classic or Renaissance) architecture is wanted. Of this kind of shop, two of the newer buildings in New York may be taken as representative, the Tiffany Building (p. 572), which owes something to the Grimani Palace, Venice, and the Gorham Building (p. 573), which a prominent French architect, who recently visited the United States and commented upon the buildings of New York, pronounced as being "the handsomest commercial structure in the world."

V.—Bank Buildings.

Early Banks.

The word *bank* is derived from the Italian *banco* (French *banc*), or bench, which the Lombardy money-changers used in the market-places. When one of these bankers could not meet his obligations, his bench was broken up by the public, and from this circumstance arises the name *bankrupt*. To the Bank of Amsterdam, founded in 1609, with its four burgomaster directors, who were changed annually, is attributed the credit of being the first modern banking institution, and the model upon which practically all European banks have been based. The Bank of England, to-day the strongest financial institution in the world—practically its clearing house—was the fourth national bank of importance to be founded in modern times. The first bank established in America was the Bank of North America, in Philadelphia, in 1782.

The Classic Revival.

When Soane designed the Bank of England, the so-called "Greek Revival" had begun in the architecture of England, and very great interest was being taken in the investigations and works of Stuart and Revett. It is doubtful whether he knew, or, if he knew, gave a thought to the fact that the Greek temples were the earliest type of building used for banking purposes—in fact, State banks. It is due to the same "revival"—at least the classic revival, which had taken place throughout Europe, and especially in France—that the earliest banks built in the United States were Classic in design, and with very few exceptions all banks throughout the country have been designed on Classic lines, and are Classic in spirit if not always Classic either in form or detail. In the United States there are three classes of banks: the National banks, which are organised under the national laws; the State banks, including commercial and savings banks and the trust companies organised under the laws of the various States; and the private banks, which in some States may be opened by anybody with sufficient credit and capital, and which are not subject to any regulations more than other private business enterprises. In the State of New York, excepting National banks, the title bank can be used only in connection with institutions duly conducted under the restrictions and provisions of the State laws. The American banking system, it will be seen,

ALTMAN AND CO.'S STORE, NEW YORK CITY: STAIRCASE AND LIFT ENTRANCE.
KIMBALL, THOMPSON, AND MACINTOSH, ARCHITECTS.

differs materially from the English or Canadian in that, while in the latter countries each bank is usually a very large institution with a head bank in London or Montreal, and with numerous branches all over the country, in the former practically every bank throughout the country is an independent institution, and each bank building is, consequently, the "head bank"; which fact alone accounts for the number of costly and monumental structures which have sprung up and are continuing to spring up in every State.

Early American Banks.

Among the earliest of notable American banks was the fine structure in Wall Street, New York (p. 552), for the City Bank, now the National City Bank, designed by Isaiah Rogers, used for many years as the Customs House, which held a respectable place as a work of architecture. This has quite recently been again converted into a bank, and materially altered and improved by the addition of a super-imposed order and magnificent banking rooms from designs by Messrs. McKim, Mead, and White (p. 555). This bank was organised by a special Act of the New York Legislature in 1812, with a capital of only £160,000. At that time there were only eighty-eight banks in the United States, while in 1908 there were 21,346 banks, with a combined capital which runs to an unconscionable number of millions of pounds sterling, of which ten millions is the capital of this institution alone. Formerly, with its great rotunda (p. 561) it was almost typical of the ideal modern plan, but it is now an unusual example owing to the fact that the banking rooms are arranged on more than one floor. This is probably due to the very high value of land in this part of New York—especially in Wall Street, where a site twenty-five feet by one hundred feet will bring as much as two hundred thousand pounds, or eighty pounds per square foot. Where possible, it is considered desirable to place the whole of the bank's staff upon one floor, or upon one floor and an open gallery, so that all may fall immediately under the eye of the manager.

The Larger Banks.

Some of the best examples of the large bank are to be found in the west or middle-west of the United States. Notable among such banks is the fine building of the Illinois Trust and Savings Bank (p. 554) which covers a large island site in the heart of Chicago. Messrs. D. H. Burnham and P. J. Weber are the architects. It indicates what a great impression must have been made upon the people of Chicago by the buildings of the Columbian Exposition of 1892-3, because it was not only one of the first Classical designs to be built of permanent materials in Chicago, but to the keen business-like minds of the directors of the bank it must have seemed like sacrificing on the altar of beauty the chance to obtain a large income. One may be sure they knew that it might easily have been made twenty storeys high, also that from such a building a very large revenue could be derived; but they chose to build beautifully rather than for profit. They got not only the beauty of the elevation, but with it one of the best practical bank plans in the world. The interior arrangement is well acknowledged externally; the plan consisting of a large square glass-covered court serving as the main banking-room, surrounded on three sides by a two-storey arcade and a row of departmental offices, which the arcade separates from the banking-room and to which it affords access. The fourth side is occupied by the public hall, which is screened off from the clerical room by a marble counter running the full width of the banking-room and surmounted by a bronze grille of simple and effective design. At each end of this public space are private rooms for the use of the bank's customers, and the offices of its president, manager and other officials. All the offices are lighted by large practical windows; in the ground storey provided with transoms, in the first storey with double-hung sashes only, but all made so that they can be easily opened; for it must be remembered that a variation of more than one hundred degrees Fahrenheit may be looked for between the hottest days of August and the coldest days of January or February in all the larger cities of the northern United States; that modern American heating and ventilation apparatus will maintain an even temperature as desired from sixty-five to seventy-two degrees indoors, while the thermometer outside registers several degrees below zero. But when summer comes, with ninety or more degrees in the shade, the water left on the dry and dusty brick or asphalt roads is converted into vapour, and at the level of the street there is hardly a movement to the air; not even the refrigerating apparatus of ammonia pipes and the powerful fans which discharge cold blasts into the banking-room can be counted upon to be very effective as regards the offices on the side of the building exposed to the sun's rays. Awnings, and a portable electric fan drawing from the main room and discharging out of the window, are helpful; but the open window—one that is as large as practicable for handling—is essential.

In the Illinois Trust and Savings Bank the windows express clearly the position of the offices, and a belt-course denotes the level of the first floor. The large Corinthian colonnade offers a spacious entrance portico, protects one side from the sun's rays, and its extent indicates at the same time the width and height of the main banking-room. The detail, like the composition of the building itself, is straightforward. There is not even that central point of interest in the form of a block or cartouche, so frequently present in designs of this character, to break the balustrade or blocking course, with the almost inevitable accompanying effect of weakening and causing an apparent sag in the horizontal lines of the entablature—a defect most apparent when the colonnade is a long one. Internally, as externally, the ornament is beautiful and appropriate; only in the capitals to the columns of the upper arcade and the plaster vaulting and treatment of the pilastered wall-surface under the same arcade do we find close adhesion to precedent without keen artistic discernment. Here there is some-

AMERICAN INSURANCE COMPANY BUILDING, NEWARK, N.J. CASS GILBERT, ARCHITECT.

thing mechanical, reminding one of the fidelity shown by Germans in their work in the Classic style, without the facility and happy grace so evident in similar examples by Frenchmen. This may be regarded as typical of the accepted character of the American bank building, Classic in style and expressive in purpose. The banking-room, usually from 35 to 60ft. high, and approximately a cube in its proportions, is acknowledged externally by the employment of the order (p. 549), or by the colossal arched window within the lines of which the entrance door is usually placed (p. 553).

Two Types of Bank Plan: Type the First.

There are two usual types of plan: First, that with the public space in the centre and the tellers' cages all round (p. 561, Type A.), and the working space arranged around these; or in separate wing, as in the Metropolitan Savings Bank, Baltimore, Md., by Messrs. Parker and Thomas (p. 553), and the Cleveland Trust Company's Building at Cleveland, Ohio, by Messrs. George B. Post and Sons (p. 561), which are the same type arranged to fit irregular sites and with the banking-room under a dome. This is usually the most effective type of plan, and is customarily arranged so that the officers' and directors' rooms are very accessible to the public—that is, towards the front—and not in direct connection with the working portion of the bank, the arrangement most frequent with the trust companies.

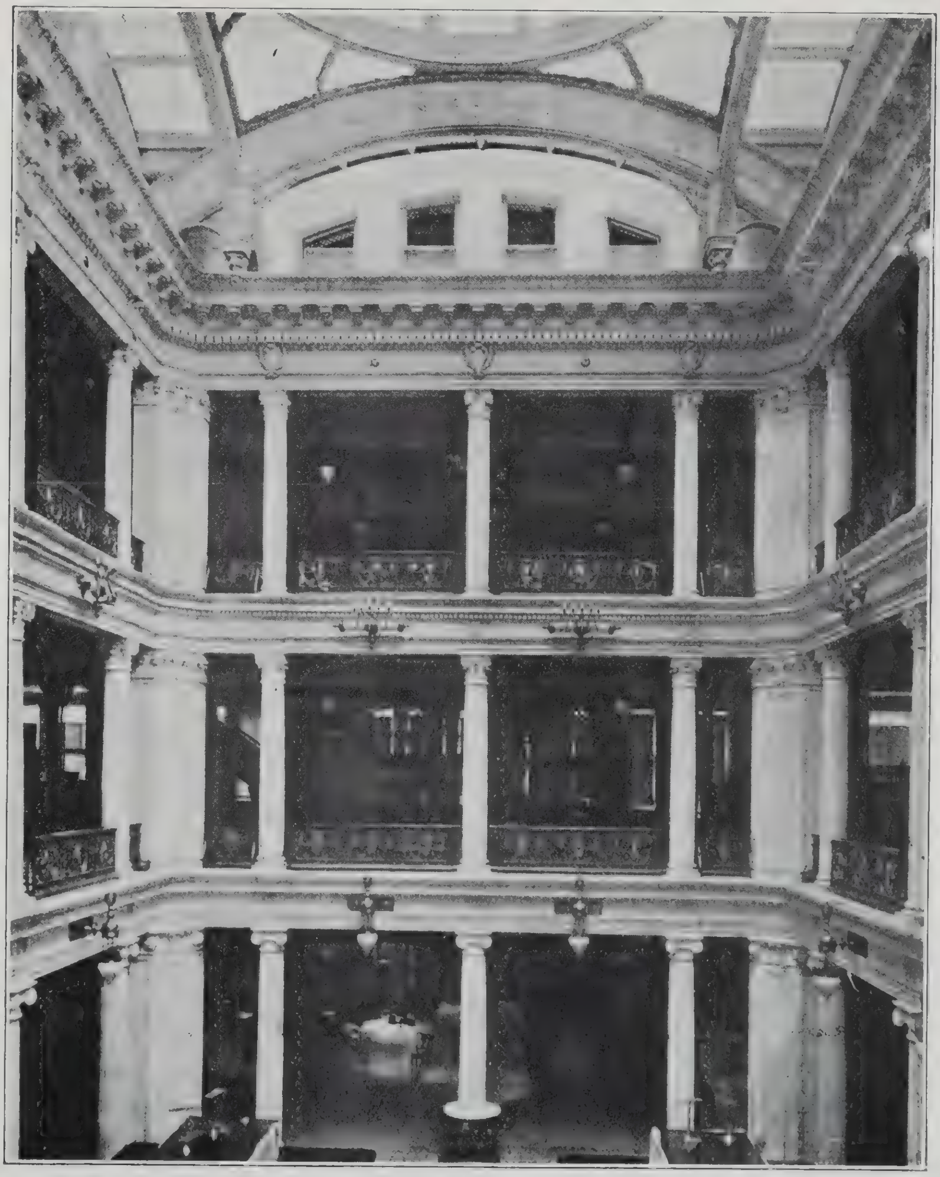
Type the Second.

The second type of bank (p. 562, type B) is that adopted where the clerks are accommodated in the central space, with the officers' rooms in direct communication with the directors' rooms and the waiting-rooms. With a comparatively narrow site, where the room can be easily spanned with girders or arches, the banking-room extends from front to back. In such banks there are no offices in front, and the vestibule is treated as part of the door, which is built in under the large arched opening (p. 553) that is often employed to express and illuminate the large hall. The Type A plan is most often employed when the site is wide and nearly square, when the offices are both the front and back, and sometimes also along the sides of the principal room. The order runs through two storeys, and the level of the first floor, or of the gallery, is indicated external by a belt course, or (as p. 554), by mouldings which sometimes form the impost to the arched heads of windows (p. 560), and are carried across the window openings in bronze.

An exceptional case, with the two-storey arrangement all round the central hall, and treated externally as a two-storey building, is illustrated by the huge building of the Girard Trust Company in Philadelphia (p. 560), which was designed by Messrs. McKim, Mead, and White. Here the full extent of the main hall is indicated only by a row of columns on each façade, under a pediment, and the dome (in this case 101ft. in diameter) rises behind. The interior (p. 561), shows the plan, which follows Type B. This is considered to be, both as to grandeur and fitness, almost the finest bank interior in existence.

Materials and Decoration.

Granite, marble, or limestone, or these materials in combination, are commonly used for the exteriors of banks, but the favourite material is marble. Exquisitely ornamented bronze, of the finest workmanship, is used for window frames and grilles, and for the lamps and other fittings. The entrance steps are nearly always of granite, with moulded nosings. "The masonry," says Mr. Swales, in a significant passage in one of his interesting articles in the "Architectural Review," "is finished in fine axed work; and entasis, flutings, mouldings, and carvings are often carried out in a way that shows that the master-workman must be more frequently found in America than here—and there can be no doubt that America has drawn severely upon Europe's supply of first-class workmen." The carving is used sparingly and bestowed judiciously; the architects supplying highly finished detail drawings, to which the sculptors work after submitting models for criticism. Inside, the floors are either of marble or marble mosaic, and are almost invariably designed by the architect. Much marble is used upon the walls. Sometimes the entire surface is covered with slabs (p. 548). Sometimes Keene's cement, polished, is substituted, and large decorative panels by the ablest artists are commissioned. In some instances the ceilings are as ornate as those of the great Italian palaces of the high Renaissance, but more often they are treated simply. The bronze counter-grille



ALTMAN AND CO.'S STORE, NEW YORK CITY: INTERIOR. KIMBALL, THOMPSON, AND MACINTOSH, ARCHITECTS.

is often designed and wrought with great skill. The grille in the Crocker Bank in San Francisco (p. 569) is a charming design in the style of the early Renaissance, influenced both by Italian and Spanish examples, yet wholly original, beautiful, and American. It is the work of the late Mr. A. Page Brown and Mr. Julius Schweinfurth, architects. Occasionally the grille may be subdued to a simple pattern, with a view to concentration of interest on some particularly fine feature, as a marble table (p. 566), or bronze clock, or wall painting, as in the State Savings Bank in Detroit, Michigan.

Essays in Originality.

The National Farmers' Bank at Owatonna, Minnesota (p. 590), by Mr. Louis H. Sullivan, is at once scholarly and original; and the design for "Security Bank" to be built of brick, stucco, and mosaic, is a daring conception of that singularly brilliant artist, the late Harvey Ellis (p. 559).

The Connecticut Savings Bank.

The Connecticut Savings Bank, New Haven (p. 590), of which Messrs. Gordon, Tracy, and Swartwout were the architects, is a good example of American Renaissance work. The fine flank, the contrast between the columnar portion and the strong and bastion-like ends, the projecting portico crowned with its pediment, impress by their expression of strength and power. The detail is after Greek models, but the effect has more of Roman sternness than of the suavity of the earlier work. This building is composed of the simplest elements, but the scholarship and feeling for proportion are evident. The interior view is very interesting, and shows a finely proportioned hall, with antæ running down the side, from whose entablature springs a fine vault. This is, unfortunately, cut off in the view, but it makes a most impressive bank interior.

Dime Savings Bank, Brooklyn.

The Dime Savings Bank of Brooklyn, (p. 558), of which Messrs. Mowbray and Uffinger were the architects, is on a site that seems to be a triangle, a shape to which we have lately become accustomed in this country. A corner entrance with axis bisecting the angle is the logical method of solving this problem. The views show how this has been done with quite a satisfactory result. The columnar effect is good, but somehow it leaves us cold and critical. The interior is much more satisfactory. It must be admitted that in this sort of spacious interior the American architects are fine designers.

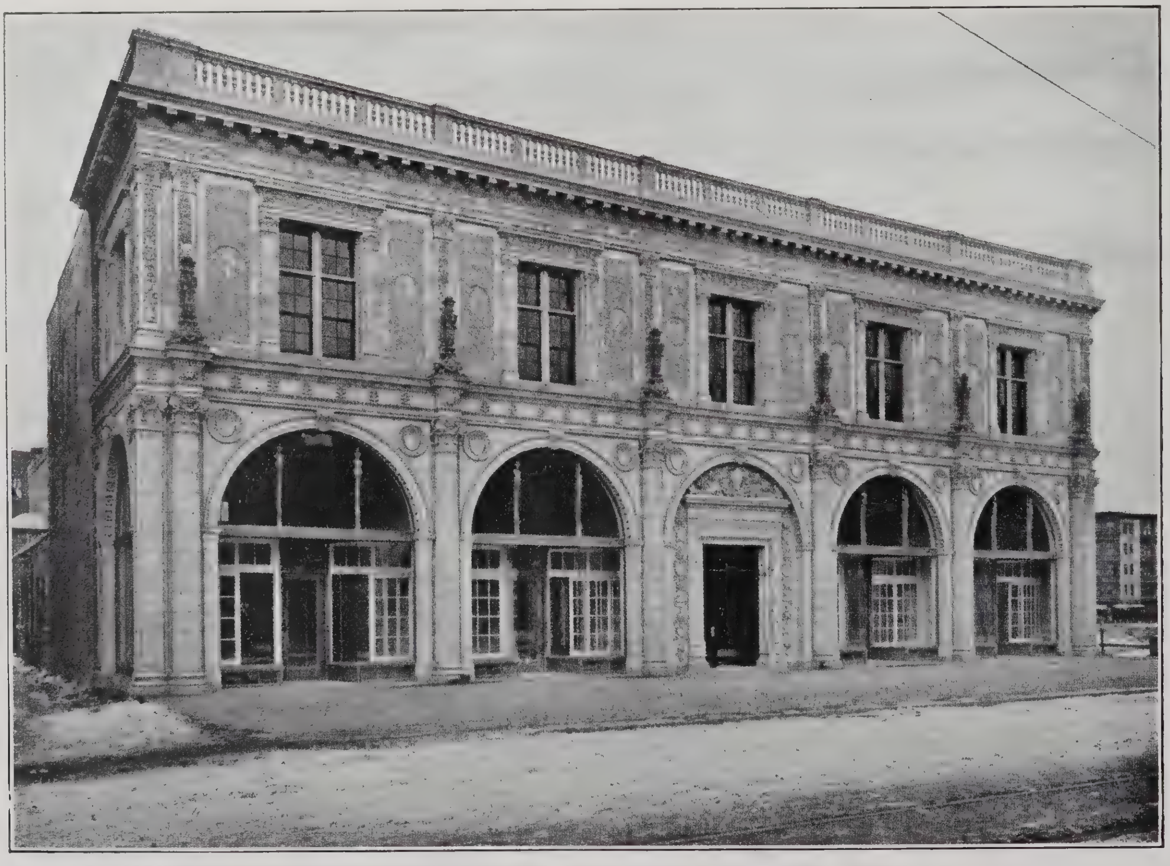
VI.—Public Buildings, Libraries, etc.

The Columbus Public Library.

If there is no tradition in America, there is no futile eclecticism to work clear of—no Gothic revival to retard the forward trend of thought in matters architectural; if they have no tradition of their own, they have chosen wisely in accepting that of France. French influence is strong, and the Beaux-Arts education is the model on which, as we have seen, the best American architecture is based.

The arrangement of the Columbus Public Library, Ohio (p. 590), of which the architect was Mr. Albert Randolph Ross, is an admirable example of axial planning. It is true that no difficulties of site having had to be considered, the problem was to a great extent simplified; yet in architecture the simple problem is not without difficulties arising from this very characteristic. One does not less admire a Greek temple because of the elementary requirements of its plan—it is the result as a whole that counts. In this case the conception of plan has gone with that of the façades to make what with but little danger of exaggeration may be regarded as a perfect building. No Renaissance building of its size can be more charming. The Petit Trianon has not more intrinsic merit as architecture. The impression these buildings give is one of a stately dignity and repose unmarred by any trifling—indeed, of the two, the American building makes its appeal more directly by reason of its chastened simplicity.

On each side of the spacious hall of the library are the main reading and the general reference rooms, with the stack-room directly at the back. Two staircases are situated on each side close to the entrance. A nicely proportioned cornice joining up the wings to the main block gives a sense of unity to the whole composition. The centre part of the front is advanced some 2ft. in front of the wings, and is ornamented with flat pilasters and three-quarter pillars in the Ionic style, taking a rich texture from this treatment, which is further enhanced by the plainness of the wings with their semi-circular-headed windows. A well-proportioned attic helps to give importance to the centre. The sculpture to the attic is admirably adjusted to its position. The details are vigorous, and nicely designed for their various positions; the moulding of the archivolt, for example, instead of running out against the glass, has a stone member expressly made to stop it. Both pillars and pilasters are reduced to the base as well as to the capital, as they are in a great deal of Venetian Renaissance and modern French work, with a very pleasant effect. The diminution to the base is very



CHICKERING HALL (PIANOFORTE SHOWROOMS), BOSTON, MASS, PEABODY AND STEARNS, ARCHITECTS.

slight: an excess in this matter leads to disastrous results. The view of the approach is of great beauty, and possesses all the qualities of fine architecture—dignity, unity, and quietness of effect, with an exquisite sense of scale.

Court House and Post Office, Indianapolis.

It would be difficult to point to a modern building in the architecture of which there is more vitality than is revealed in the United States Court House and Post Office, Indianapolis, Indiana (see p. 596). The tradition of the Renaissance seems to be alive and rejuvenescent. What could be more dignified, more imposing, than the range of great Ionic pillars carrying the weighty entablature and the delicate balustrade? What could be managed better than the strong end features to stop the colonnade, which, while strengthening the corners, also give the necessary importance to the entrances, emphasised still further by the flights of steps flanked by groups of statuary? The wide terrace with the heavy balustrading, ornamented with finely designed lamp-pillars, makes an admirable podium for the building. A fine air of distinction is the characteristic of this façade; there is no indiscreet trifling, no futile excrescence to destroy the unity of the main idea; everything is in harmony.

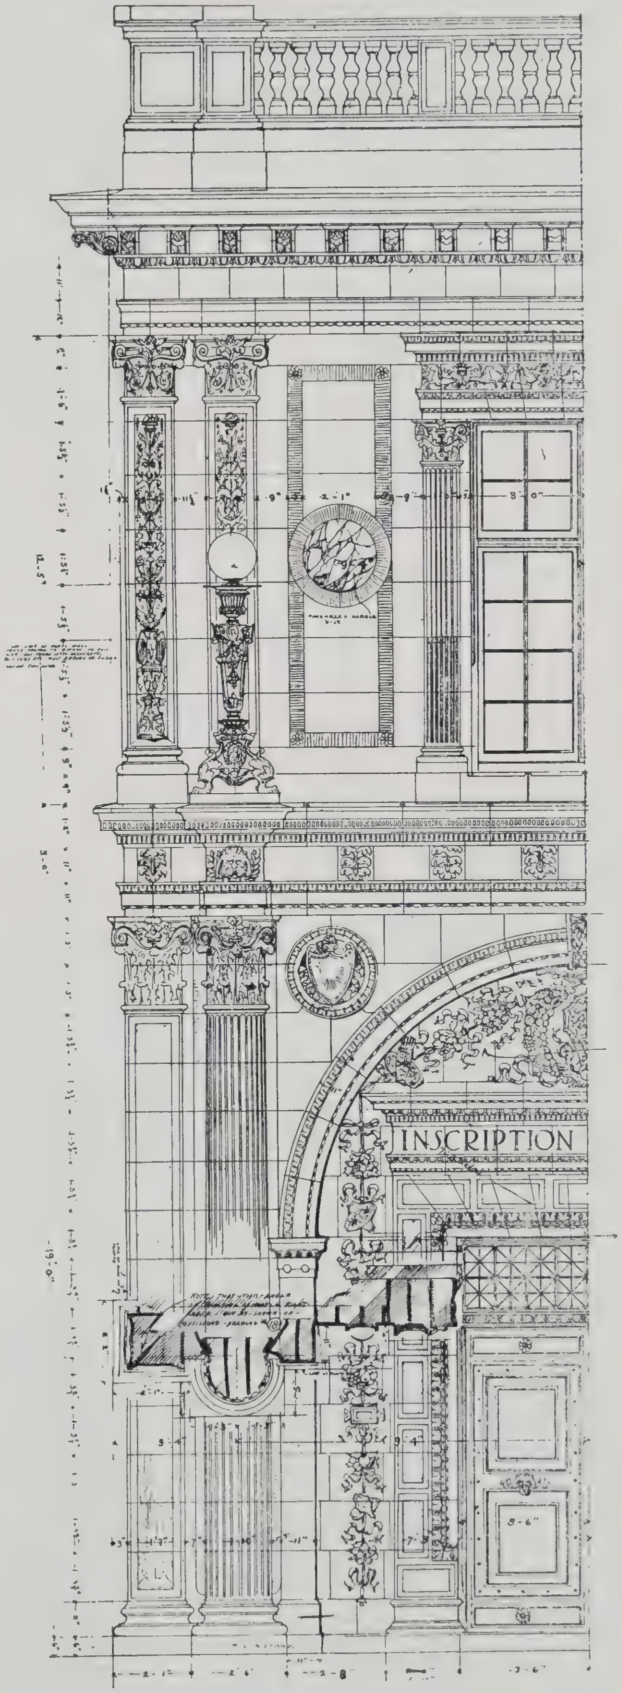
If the north front is less pleasing it is no less skilful in design. The sloping roadway for postal vans and heavy traffic is a useful device, allowing of this front being managed in an academic manner. Bold wings flank a recessed centre part, which is composed of a range of small Doric pillars with round-headed windows placed between. There is a contrast here, which is very pleasant, between the strong protecting wings and the low nestling building lying between. It should be noted in passing how well the corners are designed; instead of coupled pilasters, a heavy mass of masonry is used and capped after the manner of Greek antæ, very successfully. In the French and American Renaissance there is often a strong feeling for Greek detail, visible in the present example in the square-headed window of the main façade, the Greek capitals, but more particularly in its exquisite unity and simplicity. The plan is excellent; the carefully planned approaches, the domed octagonal spaces at their intersections, the long post office corridor, the great staircases, are all thought out in an architectural way. Of these the illustrations (p. 596), give an excellent idea—of the staircase with its winding wrought-iron baluster and handrail, of the marble-lined corridors with their vaults and decorations. Marble and mosaic are used lavishly, with fine precision of taste. To the full effect of mosaic, rounded surfaces are necessary, so that the vault and dome are ideal shapes for its application. Generally speaking, the pictorial panel is never successful, while the play of light and shade caught by rounded surfaces makes it a decoration of the greatest value. Another mark of sure judgment is the manner in which the angles of the vaults are treated, slightly rounded and without any hard bounding line or architectural moulding of stone or plaster. The architects are Messrs. Kellogg, Rankin, and Crane, of Philadelphia.

Public Baths.

The Bath interior from Phipps Natatorium, Pittsburg (p. 601), serves to show how different the American ideal is from ours in this class of work. Generally speaking, "baths and washhouses" are given over in this country to architects who have ideas of utility deeply seated in their souls, and who seldom dream of clothing the bare fact in anything but the thinnest veneer of thought. It is not to be denied that this interior shows a poor feeling for proportion—it errs much on the side of clumsiness, and the brick vault destroys instead of helping the scale; but in spite of defects it is much more architectural than the ugly skeleton to which we are accustomed. The detail of the gallery front is lacking in style, but the idea of the design is good; and the large window at the end is a great success. The Americans have a fine taste in lamps, and the spacious globes (a typical design) are excellent.

George Washington University.

The design for the group of buildings for the George Washington University—which was planned as part of the great monumental plan of the Capitol City of the United States—was selected in competition in 1905. It is a fine Classical composition of Messrs. Post and Sons (p. 589). The programme was an unusual one, being composed of two parts—one being for the



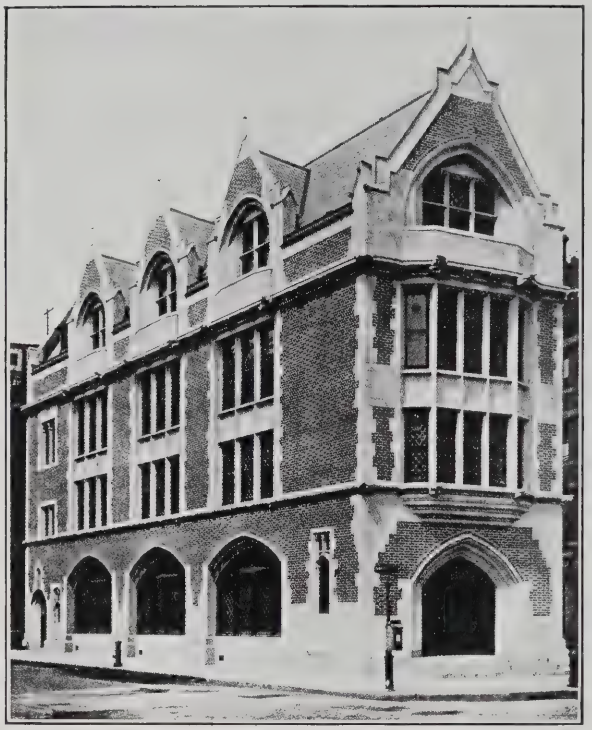
CHICKERING HALL, BOSTON, MASS: DETAIL OF FACADE.

University Buildings, and the other for a Memorial Building to be erected by the George Washington Memorial Association as a memorial to George Washington. Messrs. Post's plan for George Washington University constituted one of the ablest studies which have been made for the details of the city plan of Washington.

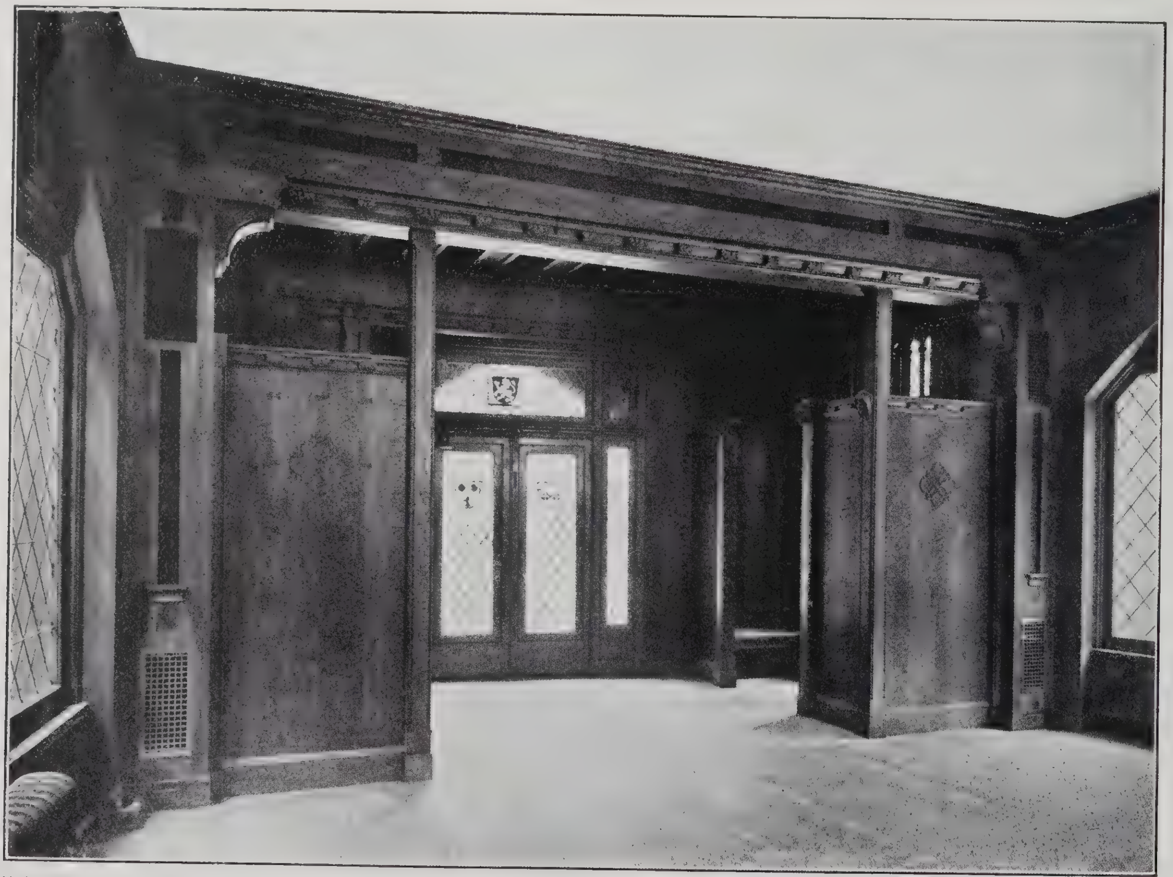
Another fine piece of city planning is that by Geo. Post for the suggested improvements of the harbour of Newport, Rhode Island (p. 603).

Wisconsin Capitol.

The Wisconsin Capitol building (p. 598) is a public monument of first importance, and as a work of American architecture will rank the greatest among the many works thus far produced, with which the name of Post will be for ever associated. The site upon which this Capitol is located is one of singular beauty. A square park, situated between two lakes and on the crest of an elevation of land, from the centre of which all of the principal avenues of the city of Madison radiate, both on the direct and diagonal lines, together with the original instructions of the Commission to the competing architects that the building should be cruciform in plan, led to the creation of a design which is radically different from any other existing State Capitol. It possesses singular points of interest both practically and artistically; practically in the fact that the various departments of the government which occupy the building are brought into the closest possible communication with each other, and at the same time are in separate wings of the building, and artistically in the fact that the great central architectural feature of the building, the dome, which rises to the height of about 200ft. above the four wings to the top of the crowning figure representing "Wisconsin," will be approached directly through monumental entrance pavilions constructed on the reentering angles of the building; and added to this the fact that the whole building to the top of the cupola is of white Vermont granite. On the line of the direct avenues dignified grand staircases lead up to the first floor level of the entrance pavilions. These serve, too, as shelters for the carriage entrances to the ground floor of the building, which may also be entered on the ground floor under the porticos at the end of each wing. The four wings placed on the diagonal lines of the Park on the extension of the four avenues, terminate in

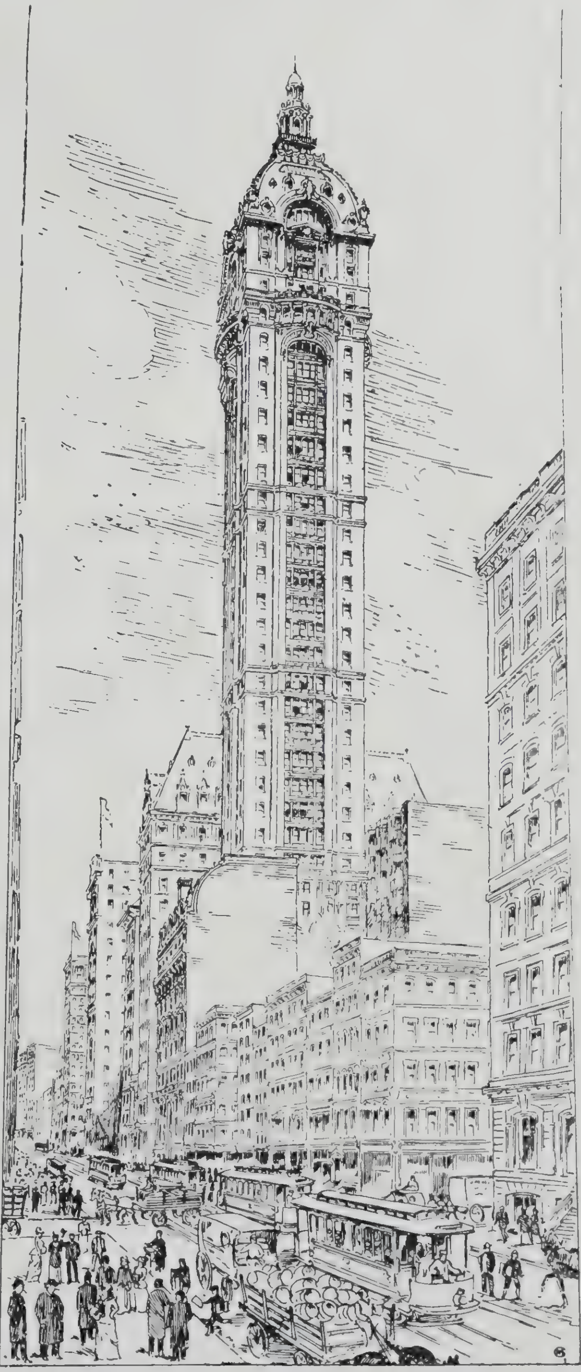


BUSH TERMINAL COMPANY OFFICES, BROAD AND PEARL STREETS. NEW YORK CITY. KIRBY, PETIT, AND GREEN, ARCHITECTS.

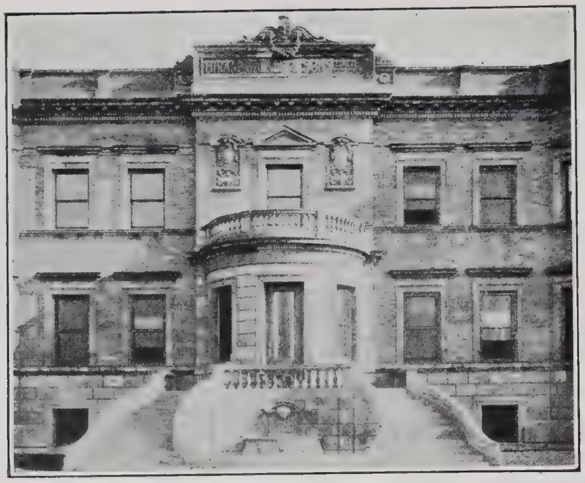


BUSH TERMINAL COMPANY, BROAD AND PEARL STREETS, NEW YORK CITY: LOBBY OFFICES KIRBY, PETIT, AND GREEN, ARCHITECTS.

dignified porticos composed of six Corinthian columns supporting pediments, in the tympanums of which are groups of statuary by Karl Bitter, that of the west wing representing "The Unveiling of the Resources of the State," and that of the east wing representing "Liberty Supported by Law." The proportion of the building from all directions is enhanced by groups of statuary at the base of the dome overlooking the corner pavilions, which not only add materially to the interest of the design, but to the pyramidal effect of the entire composition. Advantage has been taken of the opportunity afforded to make a thoroughly unique design for the interior, and by the disposition of the grand staircases unobstructed vistas about 200ft. long have been left from the principal rooms in each wing. On the ground floor uninterrupted vistas extend the whole length of the building, more than 400ft. The interior diameter of the dome is approximately 75ft., and its height from the ground floor level to the eye about 200ft. Galleries encircle the rotunda. Those on the second floor level are supported by Waupaca red granite piers, which in turn are supported on the ground floor by Wisconsin green granite piers. The piers which flank the grand staircase are similar and are erected with each wing. The gallery railings are similar to those of the staircase and stair galleries of each wing. The wall lining of the central portion of the building and staircase halls of each wing is of beautiful soft-toned Kasota stone. This is up to the main cornice line, above which it will be plaster. The same stone is also used for the wall lining in the main corridors of the first and second floors of the wings, the wall base being of Hauteville marble. On the ground floor corridor stone is used, the skirting and columns being of marble. The staircase rails and balusters are of dark red Tennessee. The treads and risers are of Meadow Grey Tennessee. The main pilasters of the staircase halls are of Pike River red granite, and the columns flanking the entrance doors to the lobbies of the principal departments at the end of the staircase halls are of red granite. In the interior design Wisconsin stones, or stones from the immediate neighbourhood of the State, have been used wherever practicable, and the architectural effect has been gained rather by elegance of proportion and careful selection of colour than by great elaboration of ornamentation or detail. Where enrichments are used, they are concentrated at the points where they will give the greatest effect, and the best talent has been employed to prepare the necessary sculptural models. In designing the three great rooms of the Capitol—the Assembly Chamber and the rooms of the Supreme Court—the architects have avoided the use, in spite of their architectural beauty, of heavy vaulted ceilings or domical forms, in order to secure as far as possible a good acoustic quality, bearing in mind the fact that the speaker will have to address the audience from any part of each one of the rooms. The form of the Assembly Chamber (A) in the west wing is approximately 73ft. by 68ft. by 41ft. high, lighted through a large circular ceiling light of low-toned leaded glass. The square form of the room is brought into the round form of this opening by very flat elliptical pendentives. The space under the elliptical arch on the north side of the chamber is occupied by the Speaker's platform, behind which the wall is wainscoted to the gallery level. The space above is occupied by the magnificent mural painting by the distinguished artist Edwin Hoyland Blashfield. It represents "The State of Wisconsin: Its Past, Present, and Future." The space under each of the remaining three elliptical arches is occupied by galleries supported by Breche Violette Italian marble columns, which separate the main auditorium from the entrance lobby and corridors, and in turn give direct access to the loggia on the west front, and the Assembly Parlour on the south side of the wing. The walls of the Assembly Chamber are of the spring of the arches, above which the walls and ceiling are of plaster, decorated with appropriate low tones to harmonize with the marble and Mr. Blashfield's painting. The room is approached through a lobby, the walls of which are lined with Botticino Italian marble, with matched panels in the central portion of Light Sienna marble. The whole length of the lobby is brought into correct proportion by the introduction of columns of Royal Tennessee marble. The central portion of the lobby opens into the main stair hall through three rich electro-plated cast-iron grilles. The Assembly Reception Room is finished in Circassian walnut panelling, with mantels at the ends of Sienna marble, and floor of marble tile. The floor tiling for the halls, corridors, and ante-rooms throughout is in carefully studied mosaic of limestones and coloured marbles in large slabs, and the electric light fixtures and ironmongery throughout have been specially designed as part of the architectural enrichment of the building. The east wing contains on the second floor the Supreme Court Room (B), and a suite of offices for the judges, and on the first floor the Executive Chamber and Attorney-General's Department. On the third floor is situated the library, connected by elevators and stairs with the corridor surrounding the Supreme Court Room, communicating with the judges' offices and also by elevator with the Attorney-General's Department on the first floor. A reading room is also provided for the general public, in connection with the



SINGER BUILDING ADDITION, BROADWAY AND LIBERTY STREETS, NEW YORK CITY. ERNEST FLAGG, ARCHITECT.



OFFICE BUILDING, WALKERVILLE, ONTARIO. GEO. D. MASON AND ALBERT KAHN, ARCHITECTS, OF DETROIT.

library. A room 46ft. by 40ft. is provided in the attic, the rest of the attic being given up to storage purposes. The Supreme Court Room is square in plan, its dimensions being 42ft. by 42ft. by 30ft. high. It is lighted by a large central ceiling light of low-toned leaded glass work, set in a flat coffered ceiling—this to prevent reverberation. The court room itself will be finished in two shades of Botticino Italian marble, the pilasters being of fine Italian Coralline marble, with small columns of Sienna behind the judges' platform. Other marbles of decorative colour are to be introduced where they will produce architectural effect. Space is provided for decorating this room with four mural paintings. The Executive Chamber, with its lobby, is most carefully studied to secure the greatest amount of dignity and decorative effect. The design for this room is in the Venetian Renaissance style, and it is arranged to introduce in the wall panels three historic mural paintings representing prominent events in the early history of the State. The building is designed to stand on a terrace or platform, and thus equalise the differences in the level of the park, and give the building a greater appearance of symmetry.

College of the City of New York.

The group of buildings for the College of the City of New York, of which George B. Post is the architect, is built on a most admirable site, bounded on the east and north by the curving line of St. Nicholas Terrace, from which the hill goes steeply down to Harlem Flats. To the west and south the ground is level, or even rises a little from the College site, and the entrance front, with its triple gateway, is seen by persons approaching it along what is practically a common city street without much rise or fall. On the other hand, the perspective view with the tower (p. 595) is practically what is seen by the person approaching the building by climbing the steep hillside which will, of necessity, always be used as a park, the view which is seen by anyone a mile away on what used to be called Harlem Flats. If, in other words, one were to stand on top of a house at 150th Street and Sixth Avenue, the point which we take to be practically coincident with the edge of the Harlem River at that point, he would see the college in this way, or nearly in this way. The Tudor Gothic or "Collegiate Gothic" style of this work suited itself well to Mr. Post's idiosyncrasies as a designer. It appears that the persons charged with the responsibility of selecting a design after what proved to be a very thorough and fair competition, found themselves led to the conviction that this style, associated with memories of Oxford and Cambridge, was what they desired to see used for the new building. A more fresh and less "decadent" one would have pleased many of us much better, but it has been interesting to see what this essentially picturesque designer has made of this rather conventional style. The plan is worked out with closest regard to common-sense and the requirements of the situation, and the exterior design has been developed naturally from that well-studied plan.

Since its completion, much has been published in regard to this group of fine buildings, and much harsh criticism has been hurled against it, particularly as regards the colour scheme. Due allowance has not been made by the critics for the weathering properties of the materials used, and the ultimate effect when partly covered with vines and relieved by the trees and shrubbery now being added.

The True View of American Architecture.

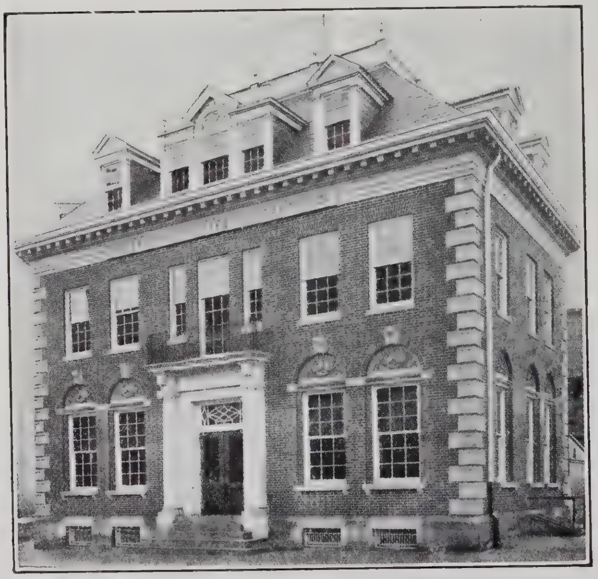
The large section of this special issue which we have felt justified in devoting to Modern American Architecture is its own apologia. In arranging for the series of articles which it embodies, it occurred to us that possibly we might encounter a certain amount of insular prejudice. For the average home-abiding Briton, American architecture meant monstrous skyscrapers; and, not greatly to our astonishment, we have met a few architects whose information on the subject was not much nearer the truth. These few we hope to have converted to the larger views of certain British architects—men of eminent reputation—who have expressed the warmest approval of our project, saying, in effect, "The Americans are doing some exceedingly fine work, and you are rendering British architects an invaluable service in placing before them such excellent examples of it." Such is the tenour of many communications that have reached us; and we must confess that we are delighted to have been able to do so much to correct the too prevalent insular view, and to have had the honour of exhibiting for the first time in this country a representative selection of the best work of the leading American architects.

International Exchange.

Between the two countries there can be no real rivalry; but there may be—and we sincerely trust that there will be—much wholesome emulation, which is an entirely different matter. The Americans are not too proud to acknowledge that they have learnt much and have still much to learn from Europe. The extent to which they are indebted to France in particular is plainly evident in many of the examples here illustrated. And we in England are at length recognising more clearly—or at all events more fully and frankly—than ever before, that, art being cosmopolitan, a free international exchange of ideas and experience is essential to progress. It is in that spirit that these examples of Modern American Architecture are here presented, and it is in that spirit that they will doubtless be warmly welcomed.

America's Larger Opportunities.

There are some respects in which British architects will hardly be able to avoid envying their American confrères. There can be but little doubt which country affords the larger opportunities. The wealthy American differs from the rich Briton in two respects that have a most important bearing on art and architecture. The former spends boldly; the latter timidly. The former, having offered a good price to a good man, is not so foolish as to interfere with him, but gives him a free hand—"trusts the man who knows"; whereas the Briton is peculiarly



METROPOLITAN LIFE INSURANCE BUILDING, BALTIMORE, MD. N. LE BRUN AND SONS ARCHITECTS.

THE CUSTOMS HOUSE, NEW YORK CITY. CASS GILBERT, ARCHITECT.

apt to be disastrously meddlesome, so that whilst an American building expresses the idea of the architect, the British building is too often a weak compromise between architect and client.

The Growth of Taste.

That in America the growth of taste seems to flourish on more congenial soil is further shown in the present high estimation in which art and art-craftsmanship are held in the States. "At no period of this country's development," says a recent writer in an American architectural contemporary, "has the artist-craftsman been held in so high regard by the public as now." It is further noted by the same writer: "Perhaps the most impressive evidence that can be adduced to prove the advance in matters of art in this country is to be found in the civic beauty movement now gaining strength from Maine to California. It would manifestly be impossible to attain the splendid results that have been secured in scores of cities if the public were apathetic, or unappreciative, of the immense value accruing from an intelligent handling of the city-planning problem. While realisation of the fact that commercial value is directly proportional to artistic merit was not general a decade ago, little argument is required to-day to convince the average municipality of the advantages, from every point of view, of adopting a comprehensive scheme for betterment and future development. Obviously an appreciation of civic art is not the first stage in the artistic development of a people, and its presence speaks volumes for the advance in matters of art of the masses in America."

The American Spirit.

We cannot, it is pointed out, have good architecture in any country until the general public acquire an understanding of and an appreciation for what is best in the work given them by the profession. As an instance of a rather different spirit from that which is too commonly encountered in our own country where decision has to be made between art and expenditure, it is related that in the case of the Bureau of American Republics in Washington, some of the sculptural adornments proved, when nearing completion, to be below the standard that the architects and the Government were desirous should prevail in this building, which is intended for the exercise of the country's hospitality to her sister Republics on the American continent. In this dilemma, Mr. Root, anxious to obtain the very best results, did not hesitate to abandon existing models and the work that was already well advanced, and to authorise the additional expenditure necessary for the substitution of more worthy work. Mr. Root, who, it is admitted, has shown rare enlightenment and artistic feeling, even for an American public man, is quoted as saying, "An architect who does not change and improve his design as it is being executed, and who does not ask for extras when necessary, must be dead." In Britain he is more apt to be dead from heartbreak, as the result of the cruel and barbaric parsimony of the authorities, who ruthlessly thwart him at every turn and ruin his design, because the only art they know or esteem is that of cutting down expenses, which, as someone has said, they have "reduced to a fine art." Yet even in America the niggardly client is still too much in evidence; otherwise there would have been no necessity for the following significant comment on Mr. Root's action: "It is unfortunate for the general public, as well as for the progress of the profession and the advancement of the art of architecture, that this breadth of view-point belongs only to an individual representing the still infrequent pioneer in artistic development. When the greater proportion of American clients have attained an equal amount of enlightenment, our [American] architecture will have adopted a much higher standard than is possible at present. In working under such appreciative conditions the individual designer is perforce put to his best endeavours, and, in case the result is not every way unimpeachably satisfactory, he cannot then blame any part of his failure upon his client!" The British architect would willingly abandon the suggested form of consolation or ground of excuse in exchange for the larger scope that, on the whole, his American cousins undoubtedly enjoy.

Open-Air Sculpture.

The growing feeling for art was manifested in a very striking way last year, by the holding, in Chicago, of an exhibition that was as remarkable in its inception as in its results. Under the auspices of the Municipal Art League—a title that excites our admiration and envy—and with the assistance of the West Chicago Park Commissioners, there was held an open-air exhibition of American sculpture. The object was to educate the public as to the proper use of sculpture in American parks, where, as in our own public places, the distribution of sculpture is usually inappropriate. "Certainly," observes a writer in the American "Architectural Review," "a war hero in fighting position is not the kind of sculpture to place in a pastoral meadow, or to burst upon in a woodland path where soul and heart have finally found rest, and proclaimed peace and goodwill to all men. Neither does the usual portrait monument placed directly in the centre of the park drive add to the effect of the landscape. On wandering along the rippling brook into a dark and shadowy cove, where every nook teems with the mysticism of the forest, here certainly is not the place for the commemoration of heroic deeds. Or in a mirroring lake, where reflections suggesting mystic depths are cast from woodland groves—not here the bearded figure ot Neptune! No; but where park and city meet—where the city extends into the park, and the park into the city, 'the clasping hand'—there we may find a place for plastic forms. Or where formal lines dominate the landscape, and precision in line is the rule—there is the natural place for an appropriate group."

It was upon such principles that the exhibition of sculpture in the Humboldt Park, Chicago, was arranged. Part of the gardens is formal, and part naturalistic, thus permitting of considerable variety in the setting of the sculpture Crunelle's fountain and Miss Walker's "Grief" were greatly emphasized by their surroundings. The bulls of French and Potter stood out well in silhouette against the red light of the western sky as day turned into night; and the forms above the garden terrace, well backed by a growth of woodland plantation, assured one of outline, and

DOME OF THE RHODE ISLAND STATE HOUSE. McKIM. MEAD, AND WHITE, ARCHITECTS.

added distinction to the gardens. The exhibition is here mentioned less for its intrinsic interest than for the light it sheds on the American view. Such an exhibition would be almost impossible in Great Britain, because we lack the enterprise, if not the parks and the art. In this matter, as in that of architecture—which, by the way, we observe that the Americans call not the "Mistress," but the "Master" Art—it is apparent that the transatlantic spirit is more audacious than our own, daring to put into action the ideas that we are content to express as pious opinions, or, indeed, that we are almost afraid to express at all, for fear of exciting the ridicule which in this country is not exclusively reserved for legitimate objects.

Architectural Gardening.

As may be inferred from the mere possibility of holding such an exhibition as that at Humboldt Park, the Americans are devoting a great deal of attention to what may be termed architectural gardening. Indeed, the interest in the subject is sufficient to support at least two periodicals that are specially devoted to it—"House and Garden," and "American Homes and Gardens," both published in New York City, the former in its sixteenth, the latter in its sixth volume. In these periodicals it is noticeable that the profession of "landscape architect" seems to be thoroughly accepted and familiar, and the success of such journals, which appeal to the wealthy laity rather than to the architect, may be regarded as a rather striking proof of the interest that the American takes in the home and its surroundings. Also, as in England, there are many periodicals of general character that give more than a side-glance at the architecture, furniture, and decoration of the home; and it has been lately a subject of serious complaint in the architectural journals that in a certain American periodical for ladies the cost of building and furnishing the sumptuous and elaborate houses illustrated has been grossly and systematically understated, to the detriment of architects. It is to be supposed that the ladies treat the pretty pictures of houses as if they were fashion-plates, and go to the architect and say, "Build me a house like this, at the cost mentioned under the picture," and when the architect is forced to say that the actual cost will be three times as much as that stated, the client sets him down as an extortionate fraud.

An Architect's New York Home.

Even in the United States an architect here and there may find time to design his own home. The residence of Mr. Bertram G. Goodhue, of the firm of Cram, Goodhue, and Ferguson, is stamped with his own individuality, although it only represents the adaptation of an existing building. It is a three-storey brick building with stone dressings, the narrow frontage being further redeemed from insipidity by the projection of two rectangular bays over a wide stone doorway.

The dwelling of an architect, as an American contemporary remarks in describing the house, is always more or less to be taken as expressive of the man's individuality or personal leanings. Oftentimes, it is true, such a dwelling may express—more than anything else—a rebound from the ordinary every-day "job" of building what other people want—even to the extent of misusing the structure to exhibit a number of "freak" ideas! This was more likely to be the case some years ago than to-day, when architecture in America has reached more of a normal plane, and its practitioners—more skilled in restraint—also realise that, if anywhere, the taste that is within their scope should be in evidence in the one building where they cannot shelter themselves behind the oft-repeated excuse, "My clients insisted upon this"—or that "eccentricity of design!" Any great individuality in plan or arrangement is almost impossible in a New York dwelling. The variations allowed within the restricted area of the small city lot are so slight that, to obtain those necessary requirements of light and air, without restricting or intruding upon one's neighbours, a "type plan" is literally forced upon the architect.

In the case of Mr. Goodhue's house, the plan was even more definitely determined, inasmuch as the building is an alteration of an existing house, where the new owner's ideas are only to be expressed on the front façade; on such important interior, elements as stairways and mantels; and what else may largely be classed among the "decorative portions" of the structure. These limitations once understood, the real individuality of the dwelling is better realised. Certainly, the owner has practised what most architects preach, in striking this note immediately upon entering the front door. The hall is, in itself, one of the simplest, yet most novel portions of the dwelling. The floor, of old yellowish-stained marble, with little square bluish-white "Persepolis" tiles at their corner intersections, and one entire wall a warm and vibrant mosaic of Mercer tile, strike at once the dominating tone of the dwelling. The stairway and hall are perhaps in design the most "modern" part of the building. A suspicion of "L'Art Nouveau" is to be discerned in the tapering column-shafts and their simple decorative touches of inlay

and colour ornament. The stair-rail and balusters, too, recall a similar idea. Other than this, the house is more suggestive of artistic leanings of a travelled man of culture than of an active practitioner of the profession of architecture! The library, also the living-room, with its English bay with leaded casements, its bookcased walls with central mantel bearing the single picture in its old Spanish colour-tones, the tile facing painted by the owner in the style of some of the old Hispano-Moresque designs; and even the simple dining-room, with its predominating colouring of Spanish leather, the simple, heavy chairs, all, in greater or less degree, represent the same dominating personality.

The most personal note is in the retired workroom (please note that it is neither "studio" nor "den") perched up over the bay in the attic. Attractive such rooms always are—attractive merely because of their informality, their "sketchy" qualities! Here, a perfectly tremendous facing of Mercer tile, set without jointing of any kind, is perhaps the most important single feature; save possibly the big painting—found in an old Spanish-American church—that decorates the opposite wall. Before the open fireplace, with cupboard doors coming in unexpected angles of the room, glimpsing cherished plunder of even more eclectic appeal, one obtains a more illuminating idea of the dwelling artist's personality than is to be gathered from all the rest of the house. Even in New York, says the American writer, in a rather illuminating passage, that modern caravanserai, one cannot hope but that a note as individual and well considered as this will have something of an effect upon the passing dwelling fashion. Modest, instead of being pretentious; restrained in colour and ornament, instead of being flamboyant; unassertive in swelling bay or glare of plate-glass windows, it is perhaps almost the antithesis of the swaggering fashionable New York residence. All this is no more than should be expected of the home of a person of discrimination and refinement; but somewhat less than might have been done by so expert a Gothicist! Its saving trait is, throughout, to be found in that touch of modernity, testifying an alertness of perception that allows itself to be influenced by modern product and experience, while yet retaining a selective right that permits the use of only those best suggestions produced by modern architectural and decorative experiment, all these combine to render it perhaps the most intimate, attractive, and personal dwelling in a modern architectural Babylon!

New Phases of American Architecture.

The issue of the American "Architectural Record" of November, 1909, was a "Country and Suburban House Number," showing a "selected assortment" of country houses which have been completed during the past two years. Mr. A. C. David, who writes the introductory article, believes it to be a correct inference from this showing that the standard of American domestic architecture is slowly but steadily improving. What those houses show is not that the better American architect has abandoned or overcome his past failings, and has arrived at or anywhere near the goal of consummate domestic design, but that the tendencies in the right direction are every year becoming more emphatic. The time-honoured errors are less conspicuous than they were. Helpful and really formative influences prevail, with fewer hindrances and over a larger area.

BOSTON PUBLIC LIBRARY. McKIM, MEAD, AND WHITE, ARCHITECTS.

COLUMBIA UNIVERSITY LIBRARY. McKIM, MEAD, AND WHITE, ARCHITECTS.

The average well-to-do American business man brings a much more liberal group of ideas to the building of his house than he once did, and his architect has obtained, in consequence, a much better opportunity to do himself justice.

The Old Spirit.

The worst faults of American country residences in the past can be traced for the most part to the inexperience, the ignorance, and the perverted ideas of the average well-to-do house builder. The ordinary American of fifteen years ago conceived the architect as a sort of a broker, whose business it was to carry out his ideas. He usually bought his site and decided on the location of his house without taking any expert advice. He deemed himself quite competent to decide what kind of a house the site demanded, how it should be approached, in what direction it should face, what trees should be chopped down and where new ones should be planted. The owner's ideas about such matters would nearly always be wrong, or, at least, incomplete. If he was a very rich man, he probably wanted a much bigger and more ostentatious house than was warranted by the site. If he was a travelled man, he may have brought home from the other side the vision of some Italian palace or Jacobean manor house, which he must have, no matter how little they were suited to the surroundings. His requirements in respect to the plan were reached wholly irrespective of their necessary effect upon the design or their relation thereto. He was rarely willing to spend as much money as was necessary to build a really substantial house; and he was still less likely to understand the necessity of making liberal appropriations for the improvement of the grounds. The architect was encouraged to spend a good deal of money on wholly unnecessary embellishments, but he was denied the money necessary to the fundamental correctness of the design. His whole relation to his client was falsified from the start, because his average employer was not prepared to seek and trust his judgment in all really essential matters connected with the plan and design of the house.

The New Spirit.

Of late years these adverse conditions have, little by little, been very much ameliorated. All over the country certain architects have been establishing a sound and solid local reputation. They are engaged by their clients, because the latter prefer or have been told to prefer their work. Their clients come to them, consequently, not to demand the copy of a Tudor abbey or a Florentine villa, but to request them to design the sort of house they are accustomed to design. While in many ways the client may still make it difficult for the architect, the latter undertakes the work under much more favourable conditions. As a rule, he gets his work because people have been attracted by what he has already done. He brings a certain amount of personal authority and prestige into his relations with his clients; and under such conditions it is much more likely to be his own fault in case he fails to obtain the support necessary to the success of his work. In this way, and for this reason, the American architectural improvement, particularly in relation to domestic buildings, depends absolutely on the increased and increasing personal reputation of certain individual architects.

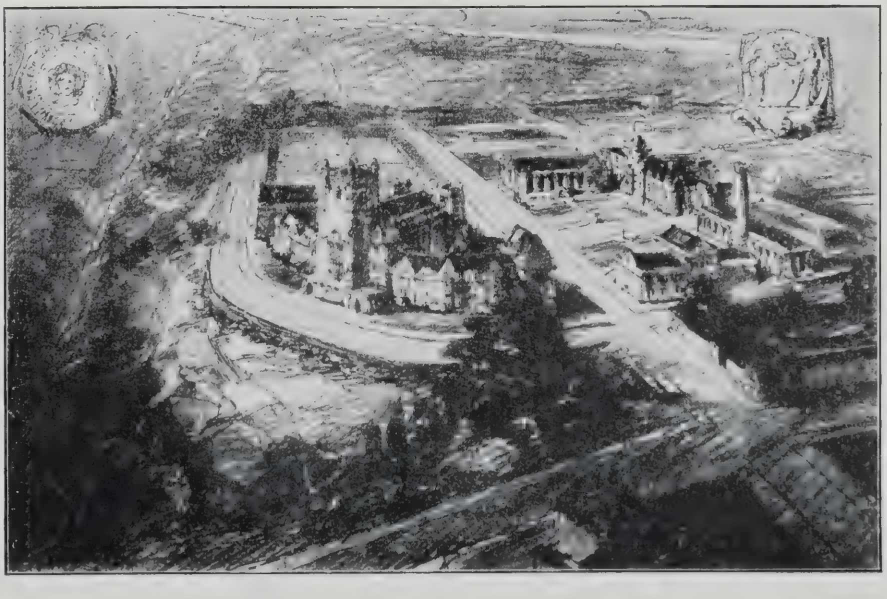
No More Suburban Palaces.

It is certain that many of the old errors are gradually being abandoned. American millionaires no longer build palaces on suburban lots. In fact, except in very rare instances, they no longer build palaces at all. Mr. John D. Rockefeller and Mr. Edward H. Harriman have, both of them, recently completed country houses which do not pretend to be palaces or even chateaux, which are situated on veritable country estates, and which are not too large in size to be the dwelling of an American citizen. In both of these instances money has been freely spent; but it has been spent not for the purpose of constructing a showy house, which would at best provide a wholly inappropriate setting for the lives of its inhabitants, but for the purpose of developing a genuine country residence. The money has been spent, that is, in the purchase of sufficient land, in the lay-out of the grounds and of gardens, and, in general, for the purpose of making the place interesting for sensible people to live in. These houses are the expression of a wholesome and many-sided interest in country life; and as such they inevitably assume a more genuinely domestic atmosphere.

In the Middle West the well-to-do family is tending towards the same goal by a somewhat different road. The rich people of that vicinity have, indeed, never shown any weakness for palatial villas. Their fault, if it is a fault, has been to spend too little rather than too much money on their houses. Even when very rich they have frequently been contented

COLLEGE OF THE CITY OF NEW YORK: MAIN BUILDING. GEO. B. POST, ARCHITECT.

COLLEGE OF THE CITY OF NEW YORK: MAIN HALL. GEO. B. POST, ARCHITECT.



COLLEGE OF THE CITY OF NEW YORK: BIRD'S EYE VIEW. GEO. B. POST, ARCHITECT to erect semi-suburban houses on the outskirts of a large city, and without either any architectural pretension, or, as a rule, much architectural interest. These houses were the temporary residences of men who were still chiefly interested in business, and who did not have the inclination or the time to care very much how or where they lived. Of late years, however, men of this class in the Middle West have largely increased their fortunes, and have become more interested than formerly in the spending of their money. While still tied to their business, and while still but little inclined to assume the responsibility of very large country estates, they are tending to buy much more land than they once deemed necessary, to build more expensive houses and to spend money more freely in the lay-out of the grounds and of flower gardens. Two places are now being completed at Lake Forest, near Chicago, one for Mr. Harold McCormick and one for Mr. Philip Armour, which will in these respects establish a new standard for that part of the country.

More Uniformity of Type.

Hence it is that wherever in the United States country houses of any architectural pretension are being erected, they are tending much more uniformly to adhere to a certain type. This type, which is substantially that of an all-around country

place, has always been found near Boston and Philadelphia; and now the well-to-do families in the other large American cities are coming to acknowledge its desirability —New Yorkers by the abandonment of their former weakness for superfluous ostentation, Western families by their willingness to pay for more substantial and more completely designed houses.

Because of these improved general conditions, a constantly increasing group of American architects are obtaining admirable opportunities for really excellent work; and they are showing their appreciation of these advantages by their success in stamping their buildings with their own individual architectural point of view and interest. An increasing number of very genuine personal successes are beginning to emerge above the architectural horizon —architects who are successes not merely because they have designed a large number of conspicuous buildings, but because their work is absolutely their own and is recognised as such by a loyal and a numerous following. It would be invidious to mention these gentlemen by name, because their numbers are still very small, compared to the total number of practising architects. It might be difficult to name more than fifteen men who have made for themselves the right kind of reputation, and whose work is characterised by the right kind of integrity and distinction. But these dozen or more gentlemen are scattered all over the country, and their personal styles, however they differ one from another, are emphatic and unmistakable. Wherever they appear they exercise a profound influence upon the architecture of their vicinity, both by affording desirable models for imitation and by educating a small but influential part of the public into understanding the rights and responsibilities of an architect in relation to his client.

The architects whose work is noticed in the publication referred to above are: Charles A. Platt, J. Gamble Rogers, Chas. Barton Keen, Bosworth and Holden, Frank E. Wallis, Frost and Granger, Howard Shaw, Marshall and Fox, Spencer and Powers, Hugh Garden, Perkins and Hamilton, Pond and Pond, Bolinard and Parrson, W. A. Otis, Myron Hunt and Elmer Gray, W. Carbys Zimmerman, and Horace Trumbauer. We may perhaps be allowed to say, very frankly, that the work shown in the "Record" collection appears to us to be very much less worthy of study than the buildings of the classes that we have chosen for illustration. Roughly speaking, it is in the design of big buildings that the American architect excels. These exhibit his peculiar genius and his special characteristics, and it is to these, therefore, that we have devoted chief attention.

New Exhibition Buildings.

The Alaska-Yukon Pacific Fair, 1909, at Seattle, comprises some fine buildings, many of them constructed for permanent use. The site is on the grounds of the University of Washington, in the midst of a great fir forest on Puget Sound, and faces three mountain ranges, so that its surroundings are both picturesque and

unique. The Forestry Building can claim to be the largest log-house in the world, and there are other buildings for Agriculture, Manufactures, Fisheries, Mines, Fine Art, and Transportation, beside the Auditorium, the United States Government Buildings (including the Alaska, Hawaii, Philippines, and the Government Fisheries Buildings) and those of the foreign countries. The Washington State Building will cost £25,000, and there are also four county buildings. We show views of the Agricultural Building (pp. 604, 605), the Fine Art Building (p. 606), which is to revert to the University of Washington; the Washington State Fisheries and Mines Buildings (p. 607, and the Auditorium (p. 607)

A Canadian Bank.

The Canadian Bank of Commerce, Montreal, of which three illustrations appear respectively on pages 570, 572, and 573, has celebrated the forty-second year of its life by moving its Montreal branch into one of the most modern and substantial bank buildings in North America.

The construction of this building represents one of the largest building contracts yet performed in Montreal. On May 5th, 1907, wrecking was commenced on the old Temple building, which was for many years situated on this site. The wrecking was completed in two months, so that work on the excavation for the new building was begun about July 5th, 1907.

The building follows the Corinthian style of architecture. Granite was used in the stonework. The result is that a most imposing structure has been erected. The six granite columns, sixty feet in height and eight feet in diameter, stands well in front of the entrance. The granite façade behind extends across the entire width of the site one hundred and eighteen feet. Flights of stairs ascend from the street between the columns, which stands on granite plinths, the largest weighing twenty-six tons. In fact, the blocks forming this colonnade average twenty-six tons in weight, and the work of placing them in position was no mean engineering feat. The colonnade forms a loggia to the main wall, setting back fifteen feet from the street line. The blocks on the screen wall vary in thickness from two feet to two feet and three-quarters. To support this massive pile of stone, excavations were made to a depth of thirty-one feet below the level of the sidewalk on St. James Street. These excavations were far below any previous cuttings on this site, and near the bottom the cuttings ran into the bed of an old stream that passed through this spot ages ago. It was also shown in digging that a burying ground had formerly been on this site. The walls of the building are entirely of solid masonry. The furring is of tile and terra-cotta, the plastering of cement, the only wood in use being that which was necessary to fasten some of the wood flooring.

The main doors of the building are of plain beaten bronze. On entering the main building the banking hall is directly in front. This rises to the full height of the building, the only break being the windows on the sides. Corinthian pilasters reach to the top of the walls, relieving the plainness of the walls. At either side of the western end of the counting room are heroic-sized figures, standing boldly out in relief.. The flooring of the public space of the banking hall is of marble squares. Within the staff enclosure, the

flooring is covered with cork blocks, three-quarters of an inch in thickness, making a noiseless and restful footing.

The grillwork dividing the counting room is of beaten bronze. The desks are of teak wood, and trimmings of ormolu bronze.

There are five vaults in the building. The safety deposit vault is seventeen feet wide by forty-eight feet in depth. This is the largest of the vaults.

The total weight of the strong-room doors is ten and a-half tons. The weight of the doors and their lining is thirty tons. The day gate is of burnished bronze, the frames and hinges being also brought to a bright finish, which contrasts well with the entire vault surroundings.

Six trusses span the banking room to support the roof and ceiling, the skylight situated directly over this room being 90ft. by 47ft. in width. There is a second skylight situated 15ft. above the one seen from the banking room. On the north side of the counting room five windows are placed. In these windows the glass has been treated to present a cloudy effect. The edges of the windows are of stained glass, a shield over each window. On the opposite side of the wall there are no windows, but glass doors lead to the board room and directors' room. The lighting in the building is by electricity.

The Late Russell Sturgis and the Literary Side.

In an account of American architecture, it was inevitable that mention should be made of the late Russell Sturgis, who, dying in New York on February 11th, 1909, left the United States without a single representative of the literary side of the architectural profession who is also in active practice. There are Ware, Hamlin, Ricker, and other teachers and writers, but none who, like the late Henry Van Brunt and Mr. Sturgis, are active as practising architects, and to whom at the same time architectural criticism and writing is an avocation. Mr. Sturgis was born in Baltimore County, Maryland, October 16th, 1836, and graduated from the College of the City of New York, or as it was then known, the Free Academy, in 1856. He first studied architecture in the office of Leopold Eidlitz, and later in 1860 went to Munich. Here he devoted a year or more to architectural study, and his recreations were listening to the music of Wagner played at the Opera House; tramps through the country, where he found the castles of Louis, "the mad King," especially interesting, and in frequenting the famous picture galleries and museums of the city. It was probably through this early experience that he became in later years an art connoisseur and critic. His entrance into practice came shortly after his return from Munich in 1862. He joined P. B. Wight, afterwards the architect of the old Academy of Design, in offices at 98, Broadway, which they occupied together for about nine years, though not as partners. His earliest architectural work is found in the Yale University Chapel, and the Farnham and Durfee dormitories; and, in association with George Fletcher Babb, he designed the Gothic Savings Bank at Auburn. In New York, Mr. Sturgis designed a number of business blocks, and two houses for James Alfred Roosevelt and Theodore Roosevelt, the father of the late President of the United States. He was one of the first architects to use fireproofing materials in New York, and in building the

Mechanics' and Traders' Bank at Albany used that material. Like that of Mr. Van Brunt, his architectural work was scholarly, and entitled him to respect, without showing the "impulse to create" that makes the artist. Since 1880, while he has always maintained an office and executed commissions, his work has lain along those literary lines which have made him the most famous architectural critic and writer of his time, and has given architecture in the United States a foundation for a literature. His writings cover all branches of the Fine Arts, commencing with that early work, written, it is said, in Venice, "Manual of Jarves Collection of Early Italian Pictures," and include "European Architecture," "An Historical Study," "Annotated Bibliography of Fine Art," "How to Judge Architecture," "The Appreciation of Sculpture," "The Interdependence of the Arts of Design," "The Appreciation of Pictures," "A Study of the Artist's way of working in the Various Handicrafts and Arts of Design," a revision of Lubke's "History of Art," "A Dictionary of Architecture," and, lastly, a "History of Architecture." This latter, the most comprehensive, and from a professional standpoint, most important of all his writings, was not finished, but it is hoped that from his notes and material it can be satisfactorily completed. Mr. Sturgis was in a way an American Ruskin. Though he had not the poetic idealism of that writer, he had a remarkable technical and historical acquaintance with his subject; his mind was a mine of accurate information, with a minute, ready and almost unimpeachably accurate knowledge of the history of architectural art. This was the more remarkable in that for a large portion of his life his eyes were weak and near-sighted, and often to save them he had to have almost everything read to him (he was practically blind while writing the first volume of his history of architecture); but in spite of the great nervous strain this produced, his love and appreciation for art, and his power of expression and suggestion was such as to make his works the most valuable of the century to the architectural student and practitioner. He became a Fellow of the Institute in 1865, was a member of the Architectural League, the Metropolitan Museum of Art, the National Academy of Design, the National Sculpture Society, and many local clubs.

American Courage and Resource.

The boldness with which the Americans attack and overcome difficulties that elsewhere would probably be held to be insuperable, is amusingly described with respect to the undertaking at Seattle, of which illustrations appear on pp. 602-5. When the development of any quarter is hampered by a hill, however abrupt, they cut it down overnight. If there happens to be a great hotel or other construction on the top of the hill, this is slowly lowered as the hill melts, and is found later, a horizontal geometric projection of itself, on a lower plane! This same spirit was shown by a body of men who lately took over from the State of Washington, on a long lease, the tract of vacant land, almost in the heart of the city, which was formerly the site of the State University. This

covers an area of about eight small blocks, and the men who hold this lease, having formed the Metropolitan Building Company of Seattle, propose to cover this land with groups of buildings of similar aspect, uniform cornice height, and corresponding motifs and accents. Although the actual undertaking was only begun a little over a year ago, one office building is now completed and fully rented, a second is under construction, a third being drawn up, and a fourth in contemplation. It happens that this piece of land, once held by the State University, is actually, as nearly as can be calculated, the business heart of the city, and these groups of buildings will form a uniform business section unlike anything in America.

A Complicated Problem.

That, notwithstanding anything that may have been said conveying the contrary impression, American architecture suffers even as our own from the perversity and dilatoriness of Governments, may be seen from the chequered history of the New York City Court House. The conditions to be met are difficult. On the one hand is the abolition of the old court house, and on the other the preservation in structure and surroundings of the old city hall, "New York's best example of pure architectural beauty." In meeting these two requirements, there is a stupendous amount of planning to be done, both in arrangement of surroundings and in design. It is twenty years since the project was first taken up in a competition won by Charles B. Atwood, that brilliant designer who gained fame by a series of efforts of this character, and whose last work lives in that relic of the Columbian Exposition, the Field Museum. Shortly after his death in 1893 another competition was held, in which over one hundred architects participated. This was won by John R. Thomas. After each of these competitions, the legislature declined to authorise the carrying out of the work, objecting to encroachment on the City Hall Park space. Atwood's brilliant and artistic design would now be out of place, because at that time there were no skyscrapers, as now, to dominate it, and Thomas was recompensed with the commission for the Hall of Records, which was part of his general design. Now the Hall of Records Association has been asking for suggestions, and the latest is by Israels and Harder. The wisdom of seeking to obtain space for the required buildings, the demand for which has doubled since the Atwood competition, without encroaching on the beautiful City Hall or its small park, is commendable. The matter is of such moment to the future city, and so complicated in all its bearings, that it seems to go beyond the study of one architect and be taken up by an architectural commission similar to that which designed the Columbian Exposition, composed of three or five of the most capable of New York architects. With ample time to study the plans and design, a free hand in the work, with a surety of having all confidence and support given them by the people and city authorities, it seems possible that here can rise an architectural monument to twentieth century architecture that will meet with the same artistic approval that is accorded the city hall, the representative of the architecture of a hundred years ago.

The Canadian Example.

Some Canadians resent rather strongly the habit of excluding them from the map of America. The fact is that in England Canada is regarded politically rather than geographically, and consequently the Dominion is commonly treated as if it were an outlying part of England, or at least as a member of our own great family. In dealing, therefore, with Modern American Architecture we are chiefly concerned with the United States; but in order that our Canadian fellow-subjects may not suppose that we had forgotten that their fine country is an important part of North America, we have added the example of recent Canadian work shown on pp. 570-1, and described on p. 599.

December	Club House, St. Anne's-on-Sea	Between £4,000 and £5,000	Ernest Newton	Walter Stirrup and Cooper and Slater	

REPORTS AND PERSONALIA OF THE YEAR.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

Incidentally remarkable for an almost unprecedented dearth of work among the members of the architectural profession, the year now rapidly drawing to its close may yet be regarded, albeit from an entirely different point of view, as one of an epoch-marking nature.

For whilst we recognise and deplore the protracted existence of the unfortunate commercial depression from which, in common with other classes of the community, the members of a poorly paid and onerous calling are undoubtedly suffering, yet a brief review of the work accomplished during the past twelve months by the governing body of the premier architectural society reveals a condition of affairs by no means unsatisfactory to the many members of the R.I.B.A., who have the larger interests of the entire profession at heart.

Indeed, although in doing so we may be considered unduly optimistic, we venture to point out that, at the ancient stronghold of architectural conservatism, No. 9, Conduit Street, there are now unmistakable signs and portents of the advent of a long-desired change of policy under which the old order of things may, ultimately, reasonably be expected to give place to the new.

To particularise, during the ensuing year the doors of the R.I.B.A. will be opened, to their fullest extent, for the admission of the new class of members known as Licentiates. It is intended that Licentiate members of the R.I.B.A. should be either (a) architects in actual practice who are at present unable to join the Institute as Fellows, or (b) properly qualified architects' assistants.

Whether the attempt to induce outside architects to assist in closing the ranks of the profession and extending the Institute's sphere of influence meet with a favourable or an unfaourable reception from those to whom the invitation is extended, the creation of an additional class undoubtedly marks a departure from the policy which has hitherto found favour at the R.I.B.A.

We can, therefore, at least, congratulate the governing body upon a praiseworthy effort to increase the prestige and usefulness of the Institute, and trust that the innovation proposed will prove to be merely the first of many changes which must, necessarily, be associated with the adoption of a broader and more liberal-minded policy.

Another sign of the times has reference to the appointment of a committee to deal with that most difficult problem, the preparation of a Parliamentary Bill.

The constitution of this Bill, if drafted, as it should be, to meet not only the present but the future requirements of the whole profession should excite the greatest interest among members of the architectural profession, all of whom, whether already associated with the R.I.B.A. or outside that body, will eagerly await the result of the committee's deliberations and the subsequent publication of its report.

During the past year the regulations issued by the Institute for the conduct of architectural competitions have been revised by the Competitions Committee and, in all essential respects, the latter's proposals have been accepted by the Council.

Although not yet perfect, these regulations, as recently amended, are a vast improvement upon the vague "suggestions" issued by the Council of the Institute a few years ago, and promoters about to arrange the conditions of their competitions would do well to adopt one or another of the very excellent methods of procedure indicated in this official document which, presumably, will shortly be ready for general use.

Our readers will be glad to learn that at length, after, as it appears to us, many years of altogether unnecessary procrastination, the inconsistencies apparent in the oft-adversely criticised schedule of professional charges is now engagaing the attention of the governing body of the Institute and a committee will shortly be appointed to revise and amend it—or, better still, re-draft it *in toto*.

This instance of the Council's rather unexpected departure from its old-time policy of *laissez-faire* strengthens our belief that the Institute is, at last, becoming aware that its erstwhile rather somnolent attitude towards matters architectural is neither conducive "to the general advancement of civil architecture," nor is it calculated to assist, to the fullest extent possible, "in promoting and facilitating the acquirement of the various arts and sciences connected therewith."

We have so often drawn attention in this journal to the flagrant errors and contradictions which occur in the R.I.B.A.'s amazing schedule of professional charges that it would be superfluous to repeat them here. It is sufficient to say that many practitioners know to their cost, how little weight and authority the document carries with it in a court of law or *(horresco referens!)* even among architects themselves.

An earnest endeavour should be made to ensure that the scale of charges as laid down in the amended (or new) schedule should be one of a nature likely to be regarded as authoritative in actions at law, in addition to being accepted and adhered to by all architects of repute.

The question of the architect's remuneration has recently been under consideration in America and a new scale of charges has been devised by our trans-Atlantic brethren, which (*inter alia*) provides for the payment of professional consultant specialists, who may be employed to advise an architect in such matters as constructional steelwork, heating and ventilation, electrical installations, etc. Now as these are subjects upon which, owing to the imperfect nature of their scientific training, the majority of architects of to-day are anything but well informed, the cost of any extraneous professional assistance should be carefully considered by the committee appointed to deal with the important question of architects' charges.

MR. IAN MACALISTER, B.A., OXON.
Secretary of the Royal Institute of British Architects.

The proposal to establish a British School of Architecture in Rome, concurrently with the institution of a diploma course of architectural training, is still engaging the attention of those to whom it has been referred. In itself the suggestion is a highly meritorious one which deserves to receive a liberal measure of support, but the broad fact remains that it is, necessarily, very limited in its scope as it is of course intended to benefit only a few exceptionally brilliant students. But the problem of the education of the architect of the future is one of paramount importance which the establishment of a School of Architecture is Rome or elsewhere on the extremely restricted scale proposed, would do little or nothing to solve.

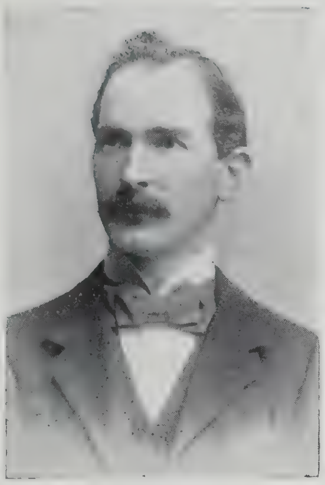
What is wanted for the training of the average student is a central school, or schools, of architecture conducted by architects in actual practice who are fully in sympathy with the principles underlying a thoroughly definite course of artistic and scientific training, such for instance as that to be obtained at the *Ecole de Beaux Arts* in Paris.

That it would be difficult to find suitable and sympathetic instructors among the architects of this country goes without saying, but it is more than probable that a sufficient number of suitable men would be forthcoming if the scheme were to assume concrete form. But if an educational scheme, on these lines, were adopted, a severe test examination, in lieu of the present ridiculous preliminary examination of the R.I.B.A. would have to be instituted with the object of inducing men of culture and good general education to seek entrance to the profession. In short, in our view, the architectural education of the majority of students should be carefully provided for and safeguarded before any attempt is made to supply a kind of post-graduate course for the exceptionally clever minority.

PRESENTATION OF THE ROYAL GOLD MEDAL.

At the presentation to Dr. Evans, Mr. George said: While most of us are occupied with our personal aims and interests, seeking our own profit or advancement, with some consideration for the greatness of our art and, perhaps, equal consideration for the necessary daily bread, there is among us a small band of workers moving on a higher plane, men who have set themselves to increase the sum of human knowledge. Some of these are engrossed in science, discovering ameliorations to sickness and pain. Some are exploring the desert and the mountain and charting unknown regions and increasing man's resources; while other brave men face the hardships of ice, storm, and starvation and fight their way to the Poles. All these explorers we delight to honour.

But to us the poles have no professional attraction: we shall not be called upon to house the surplus population and the unemployed in those regions. The inhabited world and a knowledge of past civilisations



Mr. James Glen Sivewright Gibson,

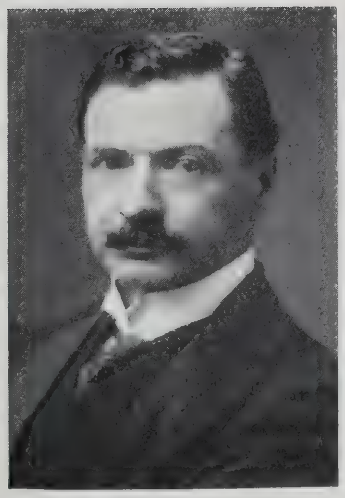
Vice-President.

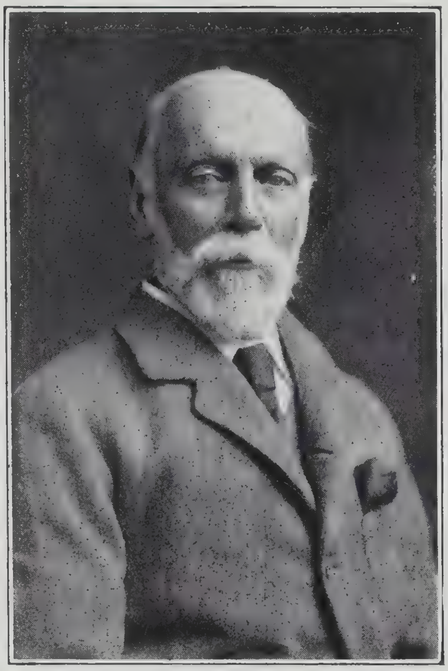
Born in Arbroath, Forfarshire. Came to London and entered the office of Mr. Wallace. There met Mr. S. B. Russell, whom he later joined in a long and famous partnership, since dissolved. Mr. Gibson's practice has been mainly in public buildings, and the firm of Gibson and Russell became famous in the annals of competitions. Among Mr. Gibson's recent works is Caxton House, Westminster.

Mr. Alfred William Stephens Cross,

Vice-President.

Mr. Cross received his general education at King's College, London, and at Gonville and Caius College, Cambridge, where he took his M.A. degree. Articled to his father, a well-known architect of Hastings and London, Mr. Cross has practised in the Metropolis for the past 20 years, during which he has designed and superintended the erection of numerous London and provincial public buildings, including the School of Technology, Manchester.



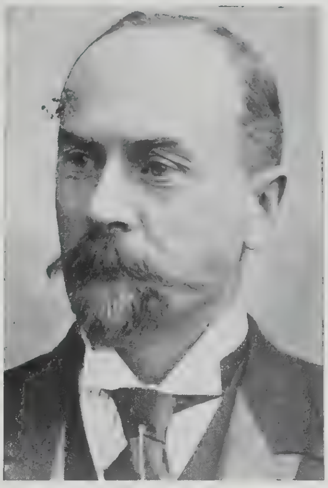


Mr. Ernest George.

President.

Born London, June 13th, 1830. Educated Brighton, Reading, R.A. gold medal of the Royal Institute of British Architects, 1896. Articled to S. Hewitt; entered Royal Academy as student; began practice with T. Vaughan; at Vaughan's death was joined by Harold Peto, and on Peto's retirement, by A. B. Yeates. Professional work: Steadleigh Court, Devon; Rousdon, Devon; Metcombe, Dorset; Batsford, Gloucester; Edgeworth Manor, Gloucester; Monk Fryston. Yorks; Poles, Herts.; North Mymms, Herts.; Buchan Hill, Sussex; Dunley Hill, Surrey; Welbeck Abbey; Eynsham Hall, Oxon.; Sedgwick Park, Sussex; Ruckley Grange, Salop; Busbridge Park, Surrey; Crathorne Hall, Yorks; Shiplake Court; Harrington Gardens; Mount Street; Collingham Gardens, S. Kensington; houses in Cadogan Square and Berkeley Square; Albemarle Hotel and Ossington, Newark; Church of St. Andrew, Streatham; St. Pancras, Rousden, Devon; the churches of Samaden and Taraso, in the Engadine; villa at Antibes, France. Publications: as an etcher—"Etchings on the Mosel," "Etchings on the Loire"; in Belgium; in Venice.

Photographs :—Mr. Ernest George, by Russell & Sons, London. Mr. J. S. Gibson by Powden & Son, Dundee. Mr. A. W. S. Cross by J. Caswall Smith, London and Mr. E. Guy Dawber by Lyd Sawyer, London.



Prof. Reginald Theodore Blomfield,

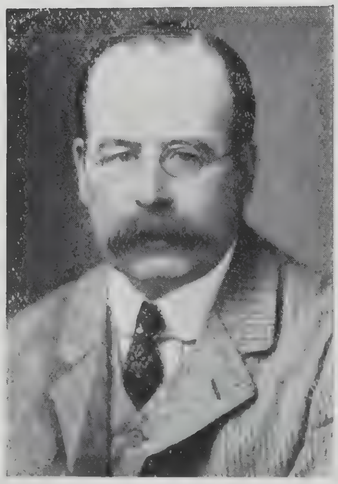
Vice-President.

Is the third son of the late Rev. G. J. Blomfield, M.A. Educated at Haileybury, gained an exhibition scholarship to Exeter College, Oxford, 2nd in Mods., 1st in Greats 1879; M.A., a Hon. Fellow, Exeter College, A.R.A., 1904. Fellow Society Antiquaries Fuller particulars of Mr. Blomfield's work are given in the article on page 517 of this issue.

Mr. Edward Guy Dawber,

Vice-President.

Born in King's Lynn, Norfolk, and was articled in that town. After expiration of articles went as an assistant in the office of Sir Thomas Deane, in Dublin, and from there as an assistant to Messrs. Ernest George and Peto. Studied at the R.A. Schools, gained lower school premium for design 1895, and upper school ditto 1896. Commenced private practice in Glostershire in 1890; moved to London 1891; was president of the A.A. in 1904-1906.



have for us a much deeper interest, and we owe a great debt to those keen sportsmen who have set themselves to discover the relics of past races, unearthing buried cities, their temples and palaces, deciphering records and showing us how men have lived and fought and built.

To such work our distinguished visitor, Dr. Arthur Evans, has devoted his mind, his time, and his means, with the splendid result of reclaiming from oblivion the long-hidden treasures of Crete.

It is our privilege periodically to recommend for his Majesty's approval a name for the distinction of the Royal Gold Medal. It is for one who by building, by writing, or by research has advanced the Art of Architecture. The first explorer to receive this mark of appreciation was the great pioneer of excavation, Sir Henry Layard, whose winged bulls, so prominent a feature in the British Museum, may be found some day to have relation to the Bulls of Knossos which Dr. Evans describes.

It is my pleasant duty to-day, in your names, to present the King's Gold Medal to Dr. Arthur Evans, who, in discovering the Palace of Minos, has, it is no exaggeration to say, completely revolutionised our accepted ideas of the early civilisations surrounding the Mediterranean basin. He has converted myth into history and floating prehistoric tradition into established fact.

But what is of paramount interest to us, he has shown that centuries before the Parthenon was thought of, indeed, before the Greek nation came into being, there were architects at Knossos and in other parts of Crete building huge monuments and palaces showing consummate skill in construction and adaptation for the use of man in an advanced state of culture. In fact, Crete has been found actually to have played the part in ancient civilisation which tradition had claimed for it. With Dr. Evans among us to-night it is not for me to tell you of Crete. I will only ask him now to accept the medal as a tribute of our high esteem.

THE ARCHITECTURAL ASSOCIATION.

As the president, Mr. Henry Tanner, F.R.I.B.A., remarked in the course of his address, delivered at the annual general meeting on October 8th, the association has no doubt felt, in various ways, the effects of the general depression. Consequently there have been an abnormal number of cases of lapsed membership, and the publications of the association have not been adequately supported, and it may or may not be from the same cause that the excellent A.A. play was not successful from the financial point of view, although artistically it left but little to be desired. The work of the association neverthless goes on with undiminished vigour, nor is the lighter side neglected. The School of Architecture, with its energetic committee and its powerful advisory Council, and its accomplished master (Mr. H. P. G. Maule, F.R.I.B.A.) and efficient staff, is flourishing exceedingly, both in its day and in its evening departments, and is doing splendid educational work, furnishing as complete an equipment for the architect as has been yet organised. Stimulus in the form of prizes and scholarships is liberally provided. The recreative side is being judiciously extended, and it is proposed to hold "At Homes" modelled on those held by the R.I.B.A., and to start a golf club. The membership at the termination of the sixty-second session, which terminated at the end of last May, was 1,685. Eighty-two members were elected, six re-joined, and the losses by resignation from other causes amounted to 111. President, Henry Tanner, F.R.I.B.A.; vice-presidents, F. Dare Clapham, F.R.I.B.A., and C. Wontner Smith, A.R.I.B.A.; secretary, D. G. Driver, F.C.I.S., 18, Tufton Street, Westminster.

From the Painting by Sir William Richmond, R.A. *Photo: F. Hollyer.*

DR. ARTHUR J. EVANS, ROYAL GOLD MEDALLIST, R.I.B.A., 1909.

Dr. Evans is well known among Architects for his explorations in the Island of Crete, during which he has partly unearthed the buried palace of Minos.

THE SOCIETY OF ARCHITECTS

The chief items of general interest in the work of the Society during the past year are as follows:—

The addition of 104 members and students, resulting in raising the total membership to one thousand, after allowing for deaths and resignations.

Early in the session the Society, by means of a donation of £50, enabled its South African Branch to co-operate with the Transvaal Institute of Architects in promoting a Registration Bill, with the result that a Bill for the Registration of Architects in the Transvaal become law on July 7th, 1909.

The Society's membership certificate is now accepted by the Transvaal Government as a qualification for registration under the Act.

A feature of the year's work has been the growth and development of the students' section and the organising of a successful series of sketching parties and visits to works.

The travelling studentship and other design competitions resulted in good entries, and some excellent work, which was exhibited in London, Cardiff, and Birmingham.

A new departure was a students' exhibition of sketches and distribution of prizes at St. Bride's Institute on November 8th, when a very useful and pleasant evening was spent.

The social functions organised by the Society were very successful, particularly the twenty-fifth annual dinner at the Trocadero, which was attended by upwards of 200 members and their friends.

One of the most important of the Council's undertakings was the completion of the negotiations for new premises by their entering into an agreement for a lease of 28, Bedford Square, which is being adapted to suit the needs of the Society. It is expected that the new premises will be ready for occupation at

The Society is co-operating with the R.I.B.A. in regard to the proper conduct of architectural competitions and other matters affecting the interests of the profession.

The Society has sustained a great loss by the retirement of Mr. Ellis Marsland from the position of Hon. Secretary, which he has held with so much advantage to the Society for over 17 years. His services are to be recognised by the presentation of the gold medal of the Society.

A gratifying feature of the year's work is the satisfactory condition of the finances, there being a surplus of assets over liabilities of £1,775, the excess of income over expenditure for the year being £261.

THE QUANTITY SURVEYORS' ASSOCIATION.

The first of the pamphlets on "Uniformity of Custom" has, as foreshadowed in our report of the association's operations in 1908, been issued to the members. This document which embodies the Council's recommendations respecting the measurement of the

Mr. Frederick Dare Clapham,

Vice-President.

Mr. Clapham, with Mr. G. B. Carvill, has been the mainstay of the A.A. play for many years past. He is a partner in the firm of Mountford and Clapham, Architects of the London Sessions House, etc., and is an F.R.I.B.A.

Mr. Maurice Everett Webb,

Hon. Secretary.

Mr. M. E. Webb is the son of Sir Aston Webb, R.A., and was articled to his father, following a University training, in which he took his M.A. degree. Mr. Webb has been one of the Editors of that merry little publication, "The Purple Patch."

Mr. Edwin Gunn,

Hon. Secretary.

Born in London 1878, and educated privately; pupil of Mr. Alfred Frampton; joined A.A. 1899; A.A. Scholarship 1900-1; Medal Advanced Class of Design 1901-2; Associate 1904; Librarian 1906-7; Editor A.A. Journal 1908; Jun. Hon. Sec. 1909; Member of Practice Standing Committee R.I.B.A.

Mr. Cyril Wontner Smith,

Vice-President

Was articled to Mr. A. Morice Butler, of London, formerly in partnership with Mr. Arnold Mitchell; served 3 years. Afterwards went into Mr. Mitchell's office, in the offices of Sir Aston Webb, W. D. Caröe, Sir A. Blomfield and Sons. Was awarded medals of merit at the Institute for measured drawings in 1896 and 1898. Won the Pugin Studentship, 1902; and in 1903 medal of merit in the Soane Medallist. Elected Assoc. R.I.B.A., 1900. Commenced practice 1903.

Mr. Henry Tanner,

President.

Mr. Tanner is the son of Sir Henry Tanner, I.S.O., the Chief Architect to H.M. Office of Works, was born in 1876, educated at the Merchant Taylors' School, and matriculated at London University. Mr. Tanner was articled to his father, and afterwards entered the office of Sir Aston Webb, R.A. He also studied at the Royal Academy Schools, where he won the travelling studentship in 1900. He was elected an Associate of the R.I.B.A. in 1899, and a Fellow in 1907. The President has been connected with the A.A. since 1896, and in 1903 was appointed hon. secretary, a post he occupied for four years; for the last two sessions he has been a vice-president.

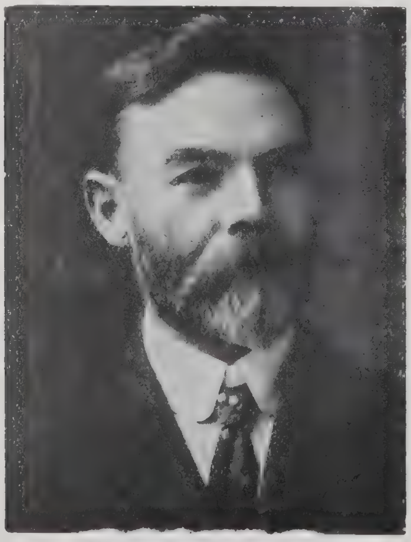
Photographs: — Mr. Tanner, by the Stereoscopic Co. Mr. Clapham, by Langford, Ltd.; Mr. Wontner Smith, by Histed & Co. Mr. Maurice E. Webb, by Russell & Sons.

Slater's and Tiler's work, has met with general approval, not only among the members of the association, but also amongst various associations of slate merchants and master slaters, to whom the want of an authoritative system of measurement has been apparent for some years.

The Council has been asked to take some action in order to mitigate the evil caused by the increasing tendency on the part of public authorities and private employers to invite tenders from contractors without providing bills of quantities, the competing firms being each supplied with reproductions of the drawings and copies of the specification from which they can either prepare their own quantities, or submit tenders based upon the cubic contents. A specification written before the quantities have been "taken-off" is generally incomplete and lacking in several essential details, therefore in the absence of a properly prepared bill of quantities it is frequently difficult to decide what is, and what is not, embodied in a tender submitted by a contractor who adopts one of the methods to which we refer. Again in dealing with the accounts for work on which considerable variations from the original drawings have been made, it is well nigh impossible to do justice to either the employer or the builder, in cases where quantities, or any satisfactory basis on which variations can be adjusted, are not provided. The Council recognising that for these reasons, estimating, under these conditions is not in the best interests of the employer and (inasmuch as an unjust burden of additional expense is placed upon them through their being compelled to employ quantity surveyors themselves) it is obviously unfair to the builders, is doing all in its power to secure a discontinuance of the system. A conference convened by the President was held in October last, at which representatives of various societies of builders throughout the country were present, a resolution was passed urging the members of these societies to refuse to tender in competition without quantities for works costing £500 and upwards, representations have been made to the Council of the R.I.B.A., and it is hoped that by these means the evil will be modified, and the practice eventually cease.

ABERDEEN SOCIETY OF ARCHITECTS.

Representatives of the Council of the society and of the Aberdeen Master House Carpenters' Association met, at the request of the latter body, to consider and discuss various alterations proposed by the association to the mode of measurement in the model schedule. These alterations, which were for the most part of minor importance, were gone over and discussed in detail, and several of them adopted. A copy of the schedule, as revised, has since been sent to each member of the society.



MR. G. E. BOND, J.P.
President of the Society of Architects.

Photo: Whiteleys.
MR. D. G. DRIVER,
Secretary of the Architectural Association.

Several cases of builders carrying on architects' work have been dealt with by the Council, the majority of which have been settled in a satisfactory manner by the parties involved giving an undertaking to desist from the practice.

A conference with Aberdeen Master Painters' Association has been held on the question of architects specifying in schedules the name of only one manufacturer of materials, which custom had been objected to by the National Federation of Master Painters. The deputation pointed out the hardship which, in certain cases, resulted to contractors from this practice, which, however, they admitted was not so prevalent in Aberdeen as in some towns in the south. After some discussion on the subject, the deputation thanked the Council for having heard their statement, and left the matter in their hands, hoping that it would receive attention.

Two scholarships, value £2 10s. each, are awarded for measured drawings. Last year a committee was appointed to draw up a scheme for instituting further competitions among architects' pupils and apprentices in Aberdeen, for prizes to be presented by the society. This committee having met and considered the matter, reported that they were of opinion that the society should offer two prizes of £2 and £1 respectively for competition among students in the first two years of their apprenticeship, the subject for competition being selected mainly with a view to promoting efficiency in draughtsmanship; also two prizes of similar amount for competition among students in the third, fourth, and fifth years of apprenticeship, the subject selected being such as to ensure that design, as well as drawing, should be an element in the competition.

The Council is again co-operating with the Council of the Aberdeen Architectural Association in promoting a series of lectures to students during the winter session, from architects of standing, on subjects of architectural interest.

Last year there were no additions to the membership of the society, which remained at 23, President, Mr. Arthur Clyne; hon. sec., Mr. A. H. L. Mackinnon, 245, Union Street.

ALBERTA (CANADA) ASSOCIATION OF ARCHITECTS.

This association is in its third session, and has this year issued its first year book, a very businesslike publication, giving the text of the association's Act of incorporation, the association by-laws, a list of registered architects and students, and a report of the third annual meeting. From the text of the Act it appears that after the expiration of six months from the publication of the notice of the organisation of the Council of the said association, no person can take or make use of the name or title of architect, either singly or in connection with any other word, name, title or designation, giving it to be understood that he is an architect under this Act, unless he is registered under this Act as a member of the said association. Any person who, after the time above mentioned, not being registered as a member of the said association, takes or makes use of any such name, title or designation, as above mentioned, shall be liable upon summary conviction, to a fine not exceeding twenty-five dollars for the first offence, and not exceeding one hundred dollars for every subsequent offence. The regulations for architectural competitions are fairly definite as to the duties of assessors, giving five conditions under which a design should be ruled out. The president of the association is Mr. R. Percy Barnes, Edmonton; honorary president, Mr. James E. Wize, Edmonton; hon. sec., Mr. H. M. Whiddington, Strathcona. The headquarters of the association are in the new Windsor Block, Jasper Avenue, Edmonton. The registered architects and students in 1908 numbered about forty.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.

The session 1908-09 will always be memorable in the history of this association on account of the foundation of the Birmingham School of Architecture. Some two years ago the general dissatisfaction which was felt in the local educational facilities culminated in the appointment of a committee to enquire into the whole position of architectural education in Birmingham. The members of this committee have had before them at their numerous meetings reports from the Board of Architectural Education, and the various universities and schools where new architectural courses have been established; they have also had conferences with Birmingham University and the Municipal School of Art. The labours of the committee have resulted this session in a report to the Council, in which it was recommended to establish a day school. A large number of prominent architects in the city having consented to accept pupils at a reduced premium, on condition that they passed through such a school, the School of Art Committee of the City Council arranged to start an architectural day school at the School of Art in place of some of the evening classes. The Council are particularly pleased that they have persuaded their past president, Mr. J. L. Ball, to undertake the

MR. C. McARTHUR BUTLER.
Secretary of the Society of Architects.

Photo: H. T. Reed.

MR. H. T. A. CHIDGEY.
President of the Quantity Surveyors' Association.

directorship of this school at its commencement. This session was also notable on account of the inauguration of the new rooms in the Exchange Buildings, which have proved to be well suited to the requirements of the association meetings. The general meetings have more than maintained the interest of those of past years, but it is to be regretted that the attendance did not fulfil the hopes expressed in the previous report. The inaugural meeting at the Midland Hotel was of great interest on account of the fine exhibition of drawings of recent work, lent by members and many of the best-known London architects. An enjoyable excursion to Paris at Whitsuntide is chronicled. President, Mr. A. S. Dixon, M.A., F.R.I.B.A.; hon. secs., Mr. G. Salway Nicol, A.R.I.B.A., 117, Colmore Row, and H. W. Simister, Norwich Union Chambers, Congreve Street: secretary, E. Marston Rudland, C.A., 14, Temple Street.

BRISTOL SOCIETY OF ARCHITECTS.

This society, whose address is Fine Arts Academy, Queen's Road, Clifton, was established in 1850, and reorganised in 1888. It has Bristol for its centre, and Gloucestershire, Somerset, Wiltshire, and Dorset for its province. During the present year the following lectures have been given: "Recent Explorations of the Roman Forum," by Mr. St. Clair Baddeley; "English and Italian Garden Architecture," by Mr. T. H. Mawson. The ordinary meetings are held at 8 p.m. in the society's room at the Fine Arts Academy, generally on the second Monday in each month. The president is Mr. Mowbray A. Green, F.R.I.B.A., hon. sec. and treasurer, Mr. T. H. Weston, F.R.I.B.A.

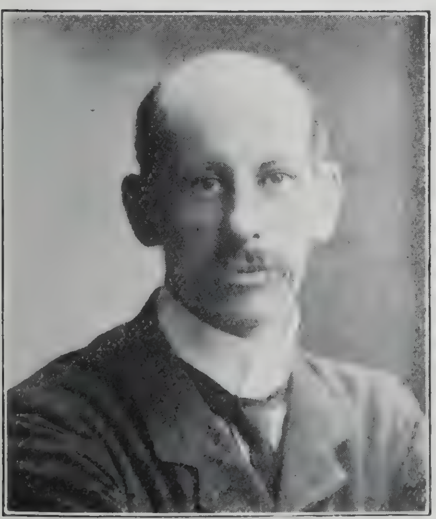

Photo: Lambert.

MR. MOWBRAY A. GREEN, F.R.I.B.A.
President of the Bristol Society of Architects.

THE ROYAL ARCHITECTURAL INSTITUTE OF CANADA.

The Royal Architectural Institute of Canada was founded as the Institute of Architects of Canada, 19th August, 1907, was incorporated by special Act of the Dominion Parliament, 16th June, 1908 (7-8, Edward VII., Chap. 82), under the corporate name of "The Architectural Institute of Canada," was granted Royal permission to adopt the prefix "Royal" to its corporate name, 2nd June, 1909.

The objects of the Royal Institute, as set forth in its Charter, are "to facilitate the acquirement and interchange of professional knowledge among its members, and more particularly to promote the acquisition of that species of knowledge which has special reference to the profession of architecture, and further to encourage investigation in connection with all branches and departments of knowledge connected with that profession."

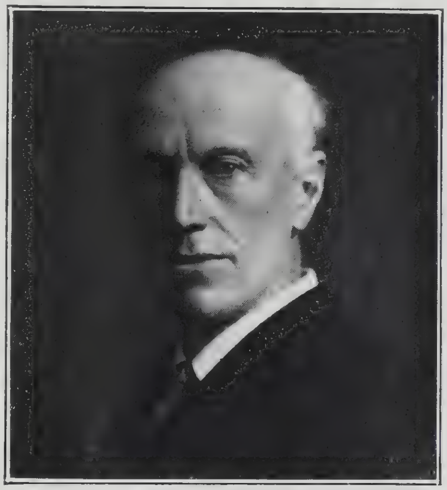

Photo: F. Hardie.

MR ARTHUR CLYNE, F.R.I.B.A.
President of the Aberdeen Society of Architects.

There are four classes of members, viz.: (1) Honorary Members, who are persons eminent in architecture or kindred sciences; (2) Honorary Corresponding Members, persons not residing in Canada, eminent as architects, or archeologists, or in art, science, or literature, who may render assistance in promoting the objects of the Royal Institute; (3) Fellows, who have practised as architects for at least ten years; (4) Associates, architects having practised architecture for at least two years.

A code of ethics, schedule of usual and proper minimum charges, regulations for architectural competitions and by-laws were adopted in the General Annual Assembly of the Royal Institute on the 29th September, 1908, held in Ottawa, Ontario. The General Annual Assembly is held in September or October.

The Royal Architectural Institute of Canada is in alliance with The Royal Institute of British Architects, and is the accredited representative of the Dominion of Canada in its relations with The Royal Institute of British Architects.

During year 1909 The Royal Institute have on its records the following to its credit:—The Right Hon. The Earl Grey, G.C.M.G., Governor General of the Dominion of Canada, has graciously consented to become the Patron of the Institute. His Majesty the King gives permission to adopt the prefix "Royal" to the title of the Institute. The alliance with the Royal Institute of British Architects. The President, Mr. A. F. Dunlop, R.C.A., is elected a Corresponding Member of the Société des Architectes Diplômés par le Governement, France. The Hon. Secretary, Mr. Alcide Chaussé, M.S.A., M.R.S.A., is elected Honorary Corresponding Member of the Sociedade dos Architectos Portuguezes (Lisbon). The membership of the Royal Institute is composed of 24 Honorary Members, 18 Honorary Corresponding Members, 125 Fellows, and 70 Associates. total, 237 members. A project of affiliation of all the Canadian architectural organisations has been prepared, and is now under consideration. The publications of the Royal Institute are (a) The Year Book, issued annually; (b) the Book of Proceedings of the General Annual Asssembly, and (c) The Quarterly Bulletin. The Officers and Council elected at the last General Annual Assembly held in Toronto, on 5th and 6th October, 1909, are as follows:—President, A. F. Dunlop, R.C.A.; Vice-presidents, Edmund Burke, J. Z. Resther and Sam. Hooper; Hon. Secretary, Alcide Chausse, M.S.A., M.R.S.A.,; Hon. Treasurer, J. W. H. Watts, R.C.A.; Council, Wm. H. Archer, F. S.

Photo: Alfred Ellis.

MR. A. G. CROSS.
Secretary of the Quantity Surveyors' Association.

Photo: H. J. B. Wills.

MR. EDGAR J. C. DOWN, A.R.I.B.A.
President of the Cardiff, South Wales, and Monmouthshire Architects' Society.

Baker, F.R.I.B.A.; C. B. Chappell, Theo. Daoust, David Ewart, I.S.O.; G. E. Fairweather, H. E. Gates, H. B. Gordon, E. L. Horwood, J. P. Hynes, R. P. LeMay, G. A. Monette, S. F. Peters, and Jas. E. Wize. The third General Annual Assembly will be held at Winnipeg, Manitoba, in September, 1910.

CARDIFF, SOUTH WALES, AND MONMOUTH ARCHITECTS' SOCIETY.

The membership of the above society for the year ending Dec. 31st, 1909, comprises 35 members, and 11 associates.

Various meeting have been held during the year, and action taken in several matters of interest to the profession, both locally and generally. Several outings have been arranged, and very interesting visits have been paid to the Cardiff new Intermediate School for Boys, where the floors were being constructed on the Coignet system of ferro-concrete, also to the new University College buildings situate in Cathay's Park, and to the Corsham Bath Stone Quarries, belonging to the Zockney and Hartsham Park Stone Co., Ltd., also to Wraxhall Manor, at all of which very interesting features of professional importance were duly pointed out and noted.

Local, preliminary, and intermediate examinations for the Royal Institute of British Architects were held in Cardiff, being conducted by the Society; also examinations in connection with the Society of Architects, which latter Society have arranged for their examinations to be held in Cardiff annually. Exhibitions of drawings from the R.I.B.A. and the Society of Architects have been held, great interest being manifested by the visitors to them.

MR. JOHN T. MACLAREN.
President of the Dundee Institute of Architects.

DEVON AND EXETER ARCHITECTURAL SOCIETY.

This society was founded in the year 1887, and became allied to the Royal Institute of British Architects in the year 1891. The society consists of three classes, members, associate members, and associates; of about 90 members, embracing the counties of Devon and Cornwall, with Exeter as its centre.

The president for the present year is Mr. Wm H. May, M.S.A., of Plymouth, the vice-president, Mr. Charles Cole, M.S.A., of Exeter; the hon. treasurer, Mr. S. Dobell, of Exeter, and the hon. secretary, Mr. Allan J. Pinn, A.R.I.B.A., of Exeter; these officers, with a Council of eight members, form the governing body.

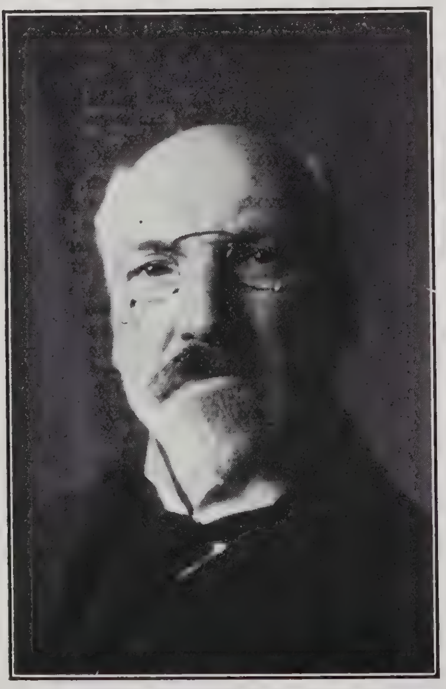
The work of the year includes a paper from Mr. James Jerman, F.R.I.B.A., of Exeter, on, "Some old Masters of Architecture and their Books," and also many matters of professional importance have been under discussion, and dealt with at various times amongst them being the further consideration and revision of the rules of the society, also a sub-committee consisting of Messrs. John M. Pinn, James Crocker, and Charles Cole, have devoted a great deal of time and trouble on the proposed revised building by-laws for the City of Exeter, which has been under consideration for some considerable time, and have had many interviews with the city surveyor on the matter.

Photo: *Albert P. Steer.*

MR. W. H. MAY.
President of the Devon and Exeter Architectural Society.

DUNDEE INSTITUTE OF ARCHITECTS.

The membership of the Institute, which was founded in 1884, and whose address is 104, Nethergate, is being steadily maintained. During the session dealt with in the report last issued, many points which have special bearing on the advancement of architecture, and on the interests of the profession in this district were brought forward. Considerable discussion and enquiry was made into the proposals for the revision of the rules of measurement, which are in use in this district. These rules—known under the short title of the "Dundee Mode of Measurement, 1898"—were adjusted in that year between the Dundee Institute of Architecture, the Dundee Master Builders' Association, and the Building Trades of the City of Dundee and vicinity. While the Council are unanimously of the opinion that many points have emerged which might with advantage be amended in the interests of all, they have felt that the present rules may suit until a fitting opportunity occurs to deal with these as a whole. The Town-Planning Bill was also very fully discussed in all its bearings as affecting the profession. Mr. John T. Maclaren is president, and Mr. William Salmond hon. sec., 6, High Street, Dundee.



MR. JOHN WATSON, F.R.I.B.A.,
President of the Edinburgh Architectural Association.

THE EDINBURGH ARCHITECTURAL ASSOCIATION.

A series of lectures during the winter season and visits in the spring and summer seasons was carried out as usual. Mr. John Watson, F.R.I.B.A., president, gave the opening address of the session, his subject being the "Architectural History of Holyrood Abbey Church." Other lectures were "Reims Cathedral," by Professor Gourlay, of Glasgow; "A Goodly Heritage," by Mr. Paul Waterhouse, London; Norfolk Church Rood Screens, by Mr. Wm. Davidson; and "Useful Hints on Gardening," by Mr. James B. Dunn, F.R.I.B.A., vice-president.

Photo: *Warneuk*

MR. GEORGE BELL, F.R.I.B.A.
President of the Glasgow Institute of Architects.

In the seven excursions held during the session were included visits to Kirkcaldy, Dunfermline, Borthwick, and Glasgow. At the last-named town the visit took place under the auspices of the Glasgow Institute of Architects. The annual excursion took place on the 3rd July, and was to Doune Castle and the Queen Victoria School, Dunblane.

The Associate section also carried through a successful series of meetings, and the usual studentship design competitions were held. With reference to these competitions, it was resolved last session to offer a special prize to Associate members attending the College of Art summer sketching classes, for the best work of the session.

The Hon. Treasurer's financial statement for the session showed a satisfactory credit balance of £23 on the ordinary funds for the year.

In accordance with a suggestion from the R.I.B.A. Records Committee, the Council appointed a committee to compile a list of the old building of architectural interest within the association district of the Institute. This record will give information both

MR. FREDERICK BATCHELOR, A.R.H.A., F.R.I.B.A.
President of the Royal Institute of Ireland.

as to those buildings which are suitable for study and those which have already been measured, and will consequently be of very great value to the architectural student.

GLASGOW INSTITUTE OF ARCHITECTS.

During the year the Council has had the subject of "Competitions" prominently before them, and it has been decided to hold a special meeting of the Institute at an early date to consider the whole matter.

In the case of one or two competitions promoted by public bodies within the Institute province, the Institute has been successful in obtaining the amendment of certain of the conditions which were considered unsatisfactory, and exhibitions of the premiated plans have also been held on the suggestion of the Institute.

Arrangements are in hand for holding an exhibition by the Institute, of architectural work, and it is expected that this will take place at an early date.

MR. PERCY ROBINSON, F.R.I.B.A.
President of the Leeds and Yorkshire Architectural Society.

The Institute continues to be the recognised centre for the R.I.B.A. examinations in Scotland. These examinations were held in June and November last.

During the year there has been a considerable increase in the membership of the Institute, which includes within its number nearly all architects of the requisite standing and qualifications in Glasgow and the West of Scotland.

THE ROYAL INSTITUTE OF ARCHITECTS OF IRELAND.

In Ireland, at any rate, the year 1909 has been singularly unfruitful in building enterprise. The consequent lack of activity in the offices of those architects in Dublin who hold seats on the Council of the Institute has enabled these gentlemen to devote themselves, even more assiduously than in former years, to the interests of the profession which they represent. Under the presidency of Mr. Batchelor, three very important undertakings were entered upon this year. The work which these undertakings involved has cast a heavy responsibility on the Council and its officers, and both deserve the gratitude of the members of the Institute in view of the successful issue. When the Irish Universities Bill passed into law, the Council seized the opportunity of memorializing the University Commission, and urging upon it the recognition of the Art of Architecture by establishing a chair of architecture in the National University of Ireland. The Council submitted to the Commission a carefully-prepared statement setting forth its views, and later, on the invitation of the Commission, appeared, by deputation, before it. It is very gratifying to record that, for the first time in Ireland, the Art of Architecture has been granted university recognition, and a chair has been provided. The appointment of Professor of Architecture has not yet (Dec. 1909) been made, but it is hoped that this post will be filled early in the New Year. Very much, of course, depends on the qualifications and personality of the Professor appointed, but the profession in Ireland eagerly look forward to great and lasting benefit by the establishment of a school of architecture in the new university in Dublin.

A very considerable number of the Council's meetings during the year have been devoted to the subject of incorporation of the Institute, and Articles of Association had to be drawn up, by-laws revised, and Board of Trade requirements embodied in these. The incorporation is now practically complete, and the labours of the Council, extending over many months, at an end.

It will be sufficient to mention, in concluding this short resumé of the Council's work during the year, the third of the undertakings previously mentioned. For a great many years the Institute and the Dublin Master Builders' Association have been in correspondence regarding the injustices which the latter body allege existed in the form of building contract generally in use in Ireland. It is a subject for congratulation to record that during the autumn of this year, as the result of several conferences between the Council of the Institute and the Master Builders' Association, a form of contract has been mutually agreed upon. It is now, in draft, under consideration by an eminent King's Counsel, and will, in a short time, it is hoped, be in the hands of the members of the Institute and in general use.

THE ARCHITECTURAL ASSOCIATION OF IRELAND.

In submitting their twelfth annual report, the committee regret a spirit of apathy exists amongst the members, which all those who have the welfare of the association at heart earnestly hope may be removed before it assumes a more serious aspect. The committee regrets to report a decrease in membership, which now stands at 94. The committee have adopted a new method of carrying on its work for the purpose of relieving the hon. secretaries of some of their labours, which heretofore proved to be very onerous. The system adopted was that of arranging the routine work of the general committee under various heads, and having it carried on by sub-committees — entitled "Programme," "By-laws," "Museum," "Press," and "Publication,"—all of whose recommendations were subject to the approval of the general committee before being put into execution. A novel feature at the general meetings—discussions by the members of set subjects of architectural and artistic interest—has proved very successful. On January 12, Sir Aston Webb gave, "A talk to Students; on January 26, amalgamation of the A.A.I. with the R.I.A.I. was discussed; on February 9, there was a discussion on, "Is the establishment of a University Degree in Architecture advisable?" on February 23, a paper on the decorative treatment of brickwork was read by Mr. F. G. Hicks, F.R.I.B.A., and on March 23, the subject of the discussion was: "Is a Modern Irish Style of Architecture possible, and, if so, what should be its characteristics?" Sir Aston Webb's address was a great success,

MR. GEORGE F. BECKETT.
President of the Architectural Association of Ireland.

MR. GEO. T. BROWN, F.R.I.B.A.
President of the Northern Architectural Association.

the Leinster Hall, which was engaged for the occasion, being crowded. Sir Aston presented to the library three copies of Ruskin's "Two Paths." The various classes were carried on this session, but the meagre attendances rather militated against their success. The museum, under the secretaryship of Mr. Joseph Geoghegan, continues to be an unqualified success, and a steady source of revenue to the association. The committee consider that, as this section of the association's activities has become so important, it would be advisable that they should have a permanent seat on the committee. Very few visits to buildings were made owing to a lack of works of importance in or near the city; but some very successful sketching visits were held. The library has been much used by the members, though additions to the stock of books have not been many. An art class was formed late in the session, taking the place of the old design club. The president is Mr. Geo. F. Beckett; hon. secs., H. G. Leark, Board of Works, Upper Merrion Street, Dublin, and W. S. Keatinge, 31, South Frederick Street, Dublin; registrar, Edwin Bradbury.

LEEDS & YORKSHIRE ARCHITECTURAL ASSOCIATION.

At the annual gathering of the society, at the Queen's Hotel, Leeds, on Nov. 11th, Mr. Percy Robinson, F.R.I.B.A., delivered his presidential address, for which he was cordially thanked on the motion of Mr. Butler Wilson, F.R.I.B.A. In seconding, the motion, however, Mr. Bowman took exception to the president's commendation of the Town Planning Bill, a measure which he, personally, regarded as having been framed by a body of gentlemen, possessing little knowledge of town planning, and in such case of little use to a city like Leeds.

The society, which was founded in 1876, and incorporated in 1885 under the Companies Act, had, according to the last-issued report, a total of 165 members. Prizes offered for the current session include a silver medal for measured drawings of old work, a prize for the construction of a timber dome, and prizes for an essay, for sketching, and for design. The hon. sec. is Mr. Albert E. Kirk; assistant hon. sec., Mr. R. W. Thorp.

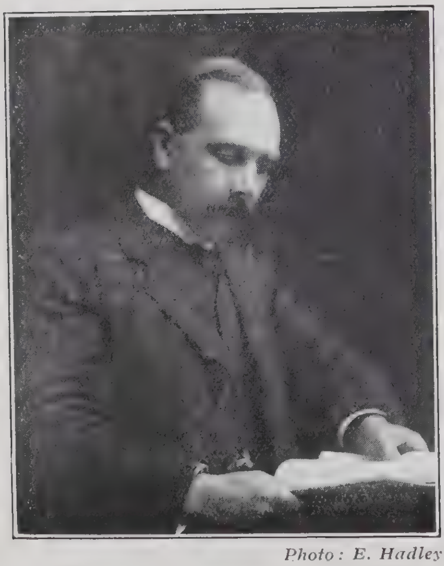

Photo: E. Hadley.

MR. A. ERNEST HEAZELL, F.R.I.B.A.
President of the Nottingham Architectural Society.

LEICESTER AND LEICESTERSHIRE SOCIETY OF ARCHITECTS.

This society held its thirty-sixth annual general meeting in April, Mr. W. E. Veites, president, in the chair, when the question of appointing a town planning committee was fully discussed, and it was decided that for the present the interests of the society in this question might be safely left in the hands of the Council. The Council in reporting upon the Housing and Town Planning Bill, had remarked that "as our municipalities have not shown the faintest trace of either an æsthetic sense or any prospective initiative, there is a danger that section 2 of the Bill may remain a dead letter outside a few fortunate areas." The Council had recommended that, in view of the possibilities afforded by the Bill, a committee should be formed, with power to co-opt influential men outside the society, to study the problems that will arise, to be ready with mature ideas, to assist in the formation of a healthy and well-informed public opinion, and generally to make up for municipal and educational shortcomings. The hon. sec. is Mr. W. K. Bedingfield, Market Street.

THE LIVERPOOL ARCHITECTURAL SOCIETY.

During the past year the position of the society, which has been steadily progressive for a number of years past, has been marked by a further improvement both numerically and financially. The administrative and other work affecting professional interests has also been steadily carried on.

One of the more important movements of the society has been made in conjunction with the Manchester Society of Architects, a movement brought about by reason of the growing number of unlimited competitions and the difficulties of dealing with unsatisfactory clauses inserted in the general conditions. It is considered that more satisfaction is likely to be obtained from the use of a recognised form of conditions drafted by the profession, then from the varied conditions compiled by individual competition promoters. A model form of conditions has been prepared, and having been approved by the two societies, has been submitted to and is now being considered by the Royal Institute of British Architects.

At the sessional meetings, papers have been read by Thos. H. Mawson, hon. A.R.I.B.A., on "The Peace Palace at the Hague," with special reference to the parks and gardens; T. Faulkner Shepheard on "Competitions"; Mervyn E. Macartney, B.A., F.R.I.B.A., on "The Three Churches of S. Paul"; T. T. Rees, F.R.I.B.A., on "The Liability of Architects to Clients and Public"; H. Inigo Triggs, A.R.I.B.A., on "The Planning of Squares and Open Spaces"; Ramsey Traquair, A.R.I.B.A., on "The Mediæval Architecture of Greece"; T. R. Spence on "The Elements of Design in Internal Decoration"; F. E. G. Badger, deputy City building surveyor, on "Reinforced Concrete and Steel Frame Buildings."

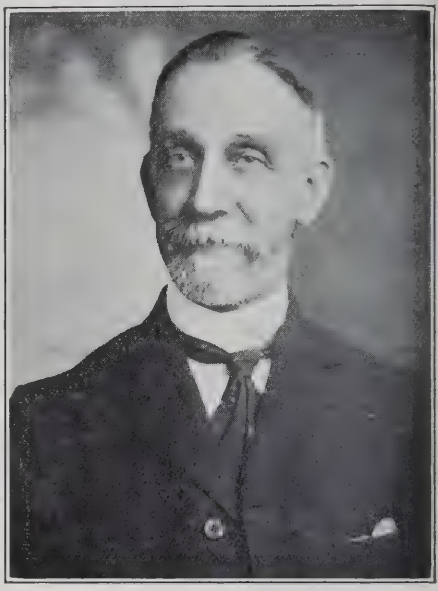

Photo: Thwaites.

MR. THOMAS MONKMAN.
President of the York and Yorkshire Architectural Society.

MANCHESTER SOCIETY OF ARCHITECTS.

In the forty-fifth annual report of the Council it appears that the membership had reached the total of 265.

The Council having seriously considered the action of members of the society who submit designs in architectural competitions when the conditions of such competitions have been deemed unsatisfactory by the Council, have, on the instructions of the members assembled in general meeting, passed an additional by-law, of which the following is a copy: "16. A member shall be considered to have failed in the observance of a lawful regulation of the society, or of a lawful regulation, by-law or order of the Council, within the meaning of article 61 of the Articles of Association, and shall be liable to the penalties therein stated if he shall submit either directly or indirectly a design in any architectural competition the conditions of which are unsatisfactory to the Council and of which notice has been given to the members by the secretary." A committee was appointed to consider the clauses of the Town Planning Act, and where advisable to communicate with local authorities and influence public opinion on the question. A committee has been appointed to consider the subject of re-inforced concrete and the fact that the Manchester Corporation bylaws contained no provisions regarding the

Photo: Henderson.

MR. W. J. HALE., F.R.I.B.A.
President of the Sheffield Society of Architects.

erection of buildings in this material. An intimation has been received that new bylaws bearing on the subject will be included in the next Bill submitted by the Corporation to Parliament. The Council suggested to the R.I.B.A. that certain alterations should be made in the document called "Professional Practice as to the Charges of Architects," with a view to limiting the liabilities of architects for defaults of builders; corresponding alterations will also be required in the document issued by the Institute called "Agreement and Schedule of Conditions of Building Contracts." The secretary of the Institute acknowledged the receipt of the suggestions and promised to lay them before his Council. The president is Mr. P. S. Worthington; hon. sec. and treasurer, Mr. Isaac Taylor, assistant hon. sec., Mr. Gerald Sanville; secretary, Mr. Arthur S. Brewis, F.C.A., Canada Chambers, 36, Spring Gardens, Manchester.

NORTHERN ARCHITECTURAL ASSOCIATION.

Mr. C. S. Errington, A.R.I.B.A., the hon. secretary, through Mr. J. Berkeley Cubey, assistant secretary, reports that the commemoration of the society's fiftieth anniversary has, of course, been the chief event of the year. Two of the founders, Mr. E. R. Robson and Mr. F. R. N. Haswell, were able to be present at the celebration dinner. During the summer excursions were made to Lumley Castle (the seat of the Earl of Scarborough), and to the Romano-British City of Corstopitum. Denton Hall, an interesting Jacobean House, near to Newcastle, was also visited. In July the annual excursion was held in the neighbourhood of Selby. The fine restoration of the Abbey was inspected, and much admired, as was also the interesting church at Hemingbrough, about 12 miles from Selby. The Winter session was opened on November 10, when the president Mr. G. T. Brown, F.R.I.B.A., delivered his inaugural address, and on December 8 Mr. John W. Simpson, of London, read a paper, entitled, "With Share and Mattock." The present membership is about 246. Mr. Geo. T. Brown, of Sunderland, the president, was re-elected for the third successive year, and is a member of the Council of the Royal Institute. Several local architectural competitions have been brought to the notice of the Practice Committee, and representations have been made to the promoters with a view to unsatisfactory conditions being amended. Hon. sec., Mr. C. S. Errington, A.R.I.B.A., 6, Higham Place, Newcastle-upon-Tyne.

NOTTINGHAM ARCHITECTURAL ASSOCIATION.

The total membership on March 31st, 1909, was 84, viz., two honorary members, 36 members, and 46 associates. President, Mr. A. Ernest Heazell, F.R.I.B.A.; hon. sec. and treasurer, W. Brandreth Savidge, A.R.I.B.A., Queen's Chambers, King Street.

SHEFFIELD SOCIETY OF ARCHITECTS & SURVEYORS.

In the summary of last year's work reference was made to three subjects which had most interested the members of this society during the year then brought to a close.

With respect to two of these satisfactory progress may be recorded. The proposed building by-laws have been further considered and discussed in detail with the special committee appointed by the City Council. Several important alterations have been promised by this committee, and there is now every likelihood that this much vexed question will be satisfactorily settled.

The Department of Agriculture connected with the local University has completed the second year of its existence, and the results achieved fully warrant the support which has been accorded to it by the members of this society and other architects and surveyors practising in the district. The number of students has increased, especially those taking the advanced subjects, and it is hoped that future years will show a much greater growth in this direction.

A pleasing feature of the year's work has been the increase in the membership of the society; after allowing for resignations there is a net increase of six; the number now standing at 129, as compared with 123 last year. This increase is due to the election of additional student members, and for this reason it is a hopeful sign, as it is from the juniors alone that provincial societies may hope to add to the number of their members

YORK AND YORKSHIRE ARCHITECTURAL SOCIETY.

The membership of this society is gradually increasing, and up to November reached a total of 50, composed of 5 Hon. Members, 28 Fellows, and 17 Associates. The society is allied to the R.I.B.A., and has nearly the whole of the North Riding of Yorkshire as its working area.

Owing to the general dullness in the architectural profession generally, the work of the society has been light this session. Several visits have had to be abandoned, owing to the persistent bad conduct of the clerk of the weather. A visit was made to Castle Havard, the seat of the Earl of Carlisle, and one of the magnificent works of Sir J. Vanburgh, the party was ciceroned by Mr. A. B. Burleigh, one of the vice-presidents. A good muster was made when the society visited St. William's College, York, during the progress of the reparation by Mr. Temple Moore, architect. Several fine 15th century fireplaces have been unearthed, and the members noted with satisfaction the very conservative manner the restoration, or rather, reparation, was being executed.

Another visit was made to Bolton Hall, in Wenslydale, the seat of Lord Bolton, and the Wensly church and village, where several interesting sketches were made.

A lecture was given by Mr. Percy Robinson, F.R.I.B.A., on "Some Modern Conditions of Architectural Design," and was listened to by a small but appreciative audience. The lecturer showed some interesting illustrations in the science of modern architecture, of both English and Foreign examples, and proved that English Civic Architecture compared very favourably with that on the Continent.

The R.I.B.A. prize drawings were on view in the society's rooms for three days, and were inspected with much interest both by members of the profession and the general public. The President for the forthcoming session is Mr. S. Needham; the vice-presidents, Mr. A. B. Burleigh, and Mr. J. H. Rutherford; the hon. treasurer is Mr. T. Monkman; the hon. librarian is Mr. E. A. Pollard; and the hon. secretary is Mr. Harold E. Henderson, assisted by Mr. R. R. T. Smith.

THE NATIONAL FEDERATION OF BUILDING TRADES EMPLOYERS AND ITS WORK IN 1909.

State of Trade.

This year appears to mark the turning point in an unusually prolonged period of depression in this industry.

The first half-year showed no improvement, but in the second half-year, some small indications of trade revival have been visible in the way of better employment reports from the Trades Unions connected with building. These, together with improved trade statistics in other industries, give ground for hope that the worst is over, and that builders may expect better trade in 1910, directly the present uncertainty as to taxation is removed by the result of a general election.

The pressure of "bad times" has brought into prominence the need for reforms in certain of the relations between builders, architects and clients.

Most of the questions referred to have been dealt with from time to time in our columns, it will suffice here to merely tabulate them. They are:—

"The Extent to which Builders' Capital is Lock up in Completed Contracts through excessive Retention of Money"; and their consequential dependence on bankers' advances, which may be withdrawn at any time with disastrous results to the builder individually, and injury to the credit of the rest of his confrères in the trade.

"The Inadequate Time Allowed for the Preparation and Delivery of Tenders"; with consequent impossibility of giving adequate study to the preparation and correctness of tenders.

"The Inviting of Tenders Without Supplying Quantities Prepared by a Competent Surveyor, to the Respective Competitors"; resulting in wasteful expenditure on the provision of various sets of quantities and sets of tenders which do not admit of fair inter-comparison.

"The Requiring of Priced Schedules to be sent in with the Tenders"; involving increased pressure on each competing builder to provide detailed priced schedules when ultimately only one set, that of the accepted tender, is really required, and incidentally picking the competitor's brains for the advantage of others, without compensation.

"The Making use of Forms of Tender and Conditions in Schedules of Quantities to Compel Acceptance in Advice of Onerous or Unfair Conditions of Contract"; under penalty of competitors' exclusion from tendering.

Much attention has been given to these questions, and an attempt made to enlist the assistance of the Professional Associations in providing a remedy in the shape of an agreed form of conditions under which tenders are sent in.

Another question of much importance is the making of engineers or architects sole referees under contracts wherein they also act professionally as engineers or architects for the execution of the contract, thereby putting them in the false position of party to, and arbitrator of, any dispute that may arise.

Several cases recently before the courts have elicited judicial pronouncements condemnatory of this anomaly, which the Federation desires to see abolished, in the true interest of all parties concerned.

Legislative.

The building trade continues to be the subject of considerable attention on the part of the Legislature, as a reference to the following measures before Parliament during 1909 will show:—

"The Building and Engineering Works Bill," a Government measure to amend the Factory Acts, by extending certain provisions thereof to enable scaffolding, etc., regulations to be applied to the building trade, was again introduced this session, but owing to pressure of other matters has had to be again dropped.

"The Trade Disputes Bill," which sought to make arbitration compulsory in trade disputes, would have injuriously affected the existing National Scheme of Conciliation which already deals with trade disputes, and was opposed therefore. It has since been dropped.

"The Trade Boards Bill," which gave power to the Board of Trade to schedule other trades than those specified in the Bill, and which it was feared might result in some sections of the building trade being scheduled as a sweated trade, was made the subject of representation by deputation to Mr. Churchill with entirely satisfactory results.

"The Housing and Town Planning Bill," which contained a clause, No. 30, strongly objected to by the Federation, was also made the subject of representation to the President of the Local Government Board. The clause was eventually struck out.

"The Labour Exchanges Bill," under which the building trade is scheduled as one of those to whom the Act shall apply; the regulations for the working of these Exchanges are expected to be issued very shortly, and will require the careful consideration of the Federation, whose members will be expected to assist on the Managing Committees, and by their example and influence help largely to make the Act a success.

Fair Wages Clause in Government Contracts

The revision of the House of Commons resolution as to fair wages in contracts, and the activity displayed by Labour representatives on various Municipal bodies throughout the country made it desirable for the Federation to draft model fair contract clauses, for the guidance of its various branches in negotiations with local authorities.

Lead Poisoning.

The question of lead poisoning in the building trade is engaging the attention of the Home Office, and a Departmental Committee on which the Federation is represented by Mr. J. W. Bellamy, of Birmingham, has been appointed to go into the matter, presumably with a view to legislative action later on.

Relations with Workmen.

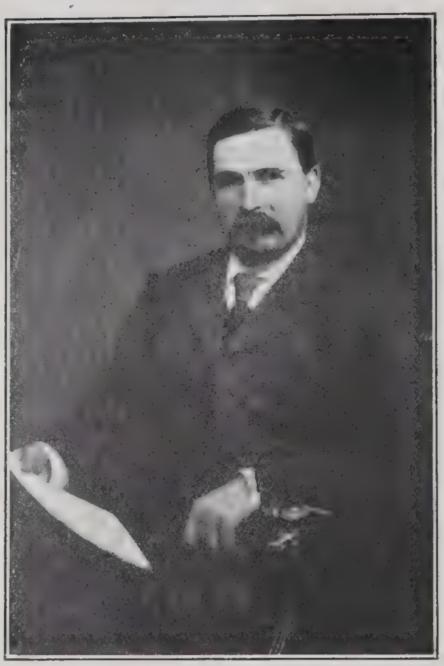
Relations with the workmen have continued good on the whole, most of the differences which have arisen has been settled by the Conciliation Boards, and the year ends without any serious dispute in progress. Considering the depressed state of trade, demands on the part of the employers for reductions of wages have been very few, but a good many demands for shortened hours, particularly before breakfast in winter, and for the abolition or mitigation of restrictions in connection with boundaries and walking time, etc., have been put forward by employers and been met by the workmen with demands for advances of wages, etc. Generally the decisions have rather favoured the contentions of the employers.

An important extension of the principles of Conciliation has been made by the completion of a revised National agreement between this Federation (and its ally the National Association of Master Plasterers), and the National Association of Operative Plasterers; the old agreement only dealt to a limited extent with disputes, but the new agreement applies the principles of conciliation to every dispute, and provides the necessary machinery for dealing therewith on lines similar to those in force in the larger conciliation scheme. This event also betokens the beginning of a new, and more friendly era, in the relations between the parties to it.

The desire of the builders' labourers for admission to the conciliation scheme has been granted, as far as existing circumstances would permit, probably as time goes on their privileges in this respect will undergo extension.

Development.

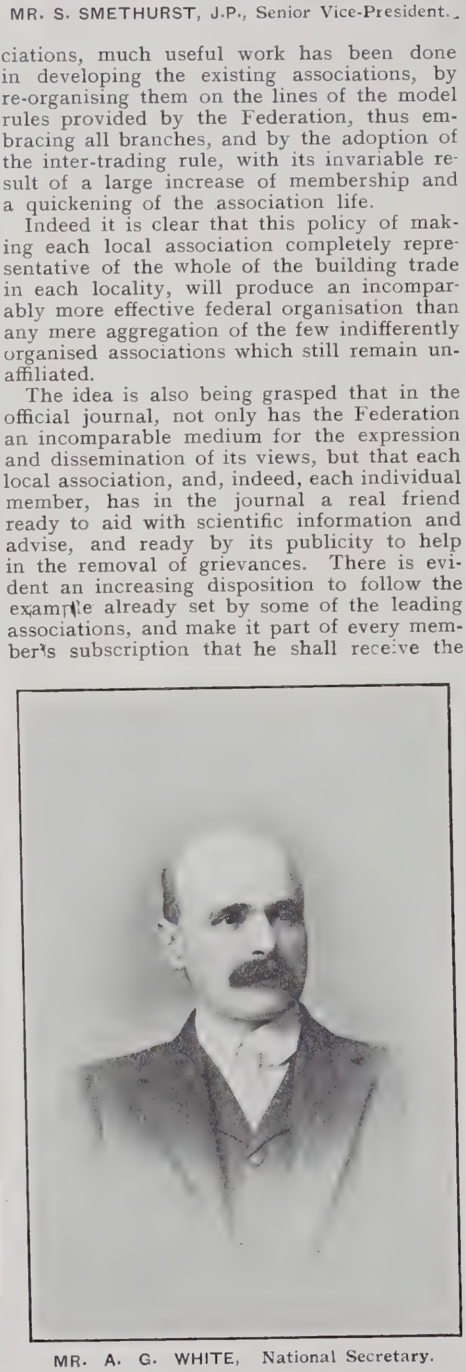
Although the times have not been favourable to the creation of many new branch associations, much useful work has been done in developing the existing associations, by re-organising them on the lines of the model rules provided by the Federation, thus embracing all branches, and by the adoption of the inter-trading rule, with its invariable result of a large increase of membership and a quickening of the association life.



MR. S. SMETHURST, J.P., Senior Vice-President.

Indeed it is clear that this policy of making each local association completely representative of the whole of the building trade in each locality, will produce an incomparably more effective federal organisation than any mere aggregation of the few indifferently organised associations which still remain unaffiliated.

The idea is also being grasped that in the official journal, not only has the Federation an incomparable medium for the expression and dissemination of its views, but that each local association, and, indeed, each individual member, has in the journal a real friend ready to aid with scientific information and advise, and ready by its publicity to help in the removal of grievances. There is evident an increasing disposition to follow the example already set by some of the leading associations, and make it part of every member's subscription that he shall receive the journal regularly. Conferences of Secretaries have been held in the various districts, and also nationally for the consideration and discussion of organisation, and other matters.



MR. A. G. WHITE, National Secretary.

Relations have been maintained with kindred organisations on the Continent, the proposals for an International Federation of the building trade have been advanced a stage by the drafting of a constitution, and the visit of a large number of builders from Belgium to Liverpool, Sheffield and London was made the occasion of a pleasant interchange of courtesies.

Friendly intercouse continues with the Australian and South African Builders' Associations, whose members frequently consult the National Secretary when visiting England.

A suggestion is now under consideration for the formation of a closer link in the shape of a special Colonial membership to enable Colonial associations or individuals to become affiliated to the home body.

The Federation Secretary is also willing to arrange International facilities for the sons of members to study abroad, exchanging with the sons of members of foreign associations who wish to study here.

THE FEDERATION PRESIDENT.

The President of the National Federation of Building Trades Employers of Great Britain and Ireland, is for this year Mr. Ernest J. Brown, a member and past President of the London Master Builders' Association, which showed its appreciation of his worth and services by nominating him to high office in the Federation. If we would express in the fewest words Mr. Brown's qualities as a President, we should say that in personality he was impressive and sympathetic; in character, frank and sincere; and in method, tactful, frank, and unpretentious.

The year has been a busy one for the president, who, in addition to dining frequently in divers places, at the hospitable tables of county federations and local associations, has conducted many meetings, and represented the Federation on various conferences of an important kind, with kindred organisations, or Government departments. In the frequently expressed words of his colleagues, Mr. Brown "makes a good president," and it will be an ample recompense to him to know that his work for the Federation is appreciated, for he is, and always has been, an ardent supporter of, and believer in, the National Federation. Only those behind the scenes know how much his tact and influence have done to consolidate the Federation in the South. Mr. Brown was the first to recognise the advantage which would accrue to the Federation, by associating with it this Journal, as the official Journal of the Federation, and was largely instrumental in bringing about the connection. He is never tired of impressing upon the members of the Federation the importance and useful possibilities of their Press organ.

Mr. Brown is a versatile man; takes a keen interest in all kinds of sport, cycles, golfs, motors, plays cricket, and acts as hon. secretary to the Eltham Golf Club. On the artistic side he is devoted to music, and was for 12 years hon. secretary and treasurer of the Lombard Amateur Musical Society. He is one of the three tallest men in the Federation, his compeers being Mr. Smeethurst, its senior vice-president, and Mr. Storrs, the chairman of the National Board of Conciliation; each of these gentlemen is over 6ft. in height, and they make an imposing trio when together.

Mr. Brown is a native of Braintree, in Essex, and a son of Mr. James Brown, J.P., a well-known member of the Metropolitan Asylums Board, and founder of the firm of James Brown and Sons, Ltd., London. As a former partner in the firm of James Brown, Son, and Blomfield, Mr. Brown gained experience in the building trade, and is now

Photo: Thomas Fall.

MR. ERNEST J. BROWN.

President of the National Federation of Building Trades Employers of Great Britain and Ireland, 1909.

director of the Frazzi Fireproof Construction, Limited.

He has also found time to render public service as vice-president of the Romford Rural District Council, and the Romford Assessment Committee. By those who know him, the president of the National Federation is voted "one of the best," and he enjoys the respect and confidence of every one with whom he is brought into contact.

THE LONDON MASTER BUILDERS' ASSOCIATION.

In writing the history of a year's work that has just been completed, it is always a matter of difficulty to pick up the threads of the previous year and to follow smoothly the course of events without missing out any important details.

The past year has been a gloomy one in the building trade—it has always been a case of hoping against hope, watching for the least sign of improvement, catching at every little straw, but alas! with always the same result; "as you were," or even a little worse!

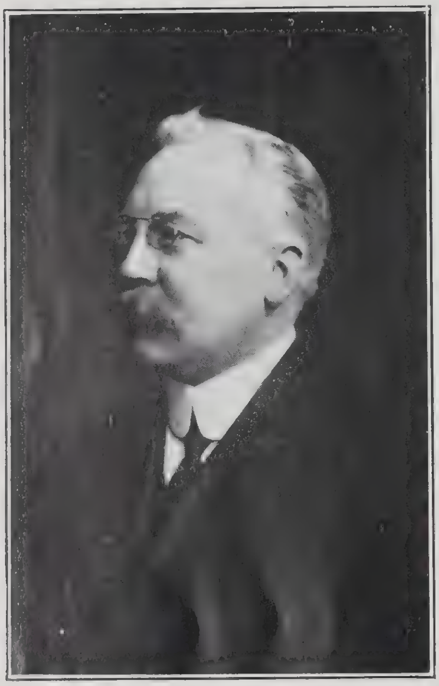


Photo: Lang Sims.

MR. F. G. RICE.

President of the London Master Builders' Association.

Notwithstanding all this, the L.M.B.A. has moved rapidly forward, the interest taken in the work by all the members of the Council has been really wonderful. All the meetings have been very fully attended, new suggestions have come forward and have been taken up enthusiastically, and the association has, as it were, suddenly come out of its shell, and become far more of a real live organisation than ever before. Truly, dull times are the ones in which to put one's household in order, and the L.M.B.A. is evidently a firm believer in that axiom.

To a large extent this is due to the persistent energy of its President, backed up by his officers and secretary, and signs are not wanting of other younger members of the association coming rapidly to the front—always a healthy sign in such organisations as this.

After years of unsuccessful attempts to obtain suitable offices for the association and its kindred societies, a home has at last been "booked," and, so soon as the selected buildings in Kingsway are completed, Bedford Street will "know it no more," except in name—a memory only.

Much legislation has taken place during the year, affecting the building trade, and the L.M.B.A. Council has taken its part in various amendments and improvements of many of the Bills that have been introduced. Conferences have taken place that have been productive, not only of good so far as regards the Bills themselves, but of pleasant intercourse between the professions closely allied to the building trade and its representatives.

Such a measure as the Sweated Industries Bill was not allowed to go unchallenged, and the deputation to Mr. Winston Churchill from the Employers' Parliamentary Council were eminently successful in gaining their point, under the leadership of that old Parliamentary hand, Mr. William Shepherd, whose clever insinuation made at the close of the interview "that it would be beneficial for those interested in the Bill to be able to see how far Mr. Churchill had met the views of the deputation by reading it in their morning papers" will long be remembered by those who were present, as the idea born of a master mind.

Another very important interview that took place during the year, was that with the permanent officers of the Board of Trade with reference to the Labour Exchanges, a measure of rather doubtful benefit to the building trade generally or to the workmen. Builder's foremen are very conservative in their methods, and it will be difficult to induce them to make any alteration in their ways of obtaining what labour they require, especially when work is so slack and workers so many.

It is not our intention here to discuss all the different Bills that have been brought forward, and it will suffice to mention the most important ones, to which the association has given particular attention.

They are, in addition to those already mentioned Factory and Workshop Act, 1901 (amendments), Railways (eight hours), Road Traffic, Trade Disputes, Trade Boards, Compulsory Weighing and Measurement, Engines and Boilers (persons in charge). To those must be added the Finance Bill, and it will be remembered how some of the members of the L.M.B.A. took prominent part in the meeting convened at Queen's Hall by the surveyors. A slight but important alteration was arrived at with the R.I.B.A. in the form of contract, which will obviate the trouble of the real meaning of the original clause in question being properly understood.

Another important subject which has been discussed was that of the supplying of quantities by building owners, and in this respect it is hoped a very great improvement may ultimately result.

One of the most interesting functions of the year was that of the dinner to the Belgian builders, given by the association at St. Ermin's Hotel, which was the headquarters of the visitors for two or three days in London.

The delightful "camaraderie" that was in evidence upon the occasion will be remembered for many a long day by the members who attended. It was a revelation to all when the President, Mr. Rice, and Mr. Higgs made their speeches in French, showing a perfect grasp of the intricacies of that language and its many difficult idioms in connection with the trade of which they were speaking.

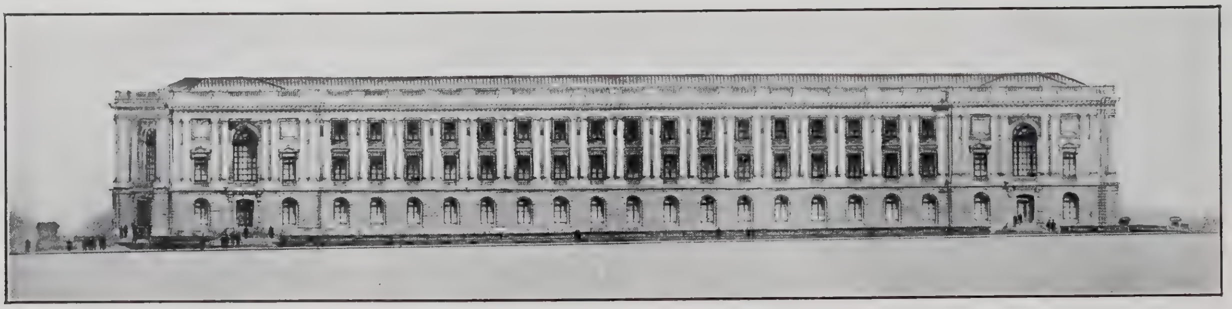
Photo: Brown, Barnes, and Bell.

MR. THOMAS COSTIGAN.

Secretary of the London Master Builders' Association.

The mention of Mr. Rice in this respect offers the opportunity of congratulating the association upon having had him for its president during the past year. As each president goes, one thinks how good a man he has been, how difficult his successor will find it to keep up to the high-water mark he has reached. Mr. Rice's successor will indeed have all his work cut out, for the president for 1909 has excelled himself. His firm insistence has often ended in opposition collapsing, and a speedy result being arrived at, his quiet quaint quips have been appreciated, for he possesses a great fund of humour, added to which he has proved himself a leader full of energy and tact, and has put his heart into his work from start to finish.

We are not alone in thinking it is a pity so many of the past presidents have stepped down from the chair and buried themselves in oblivion, and we sincerely hope that Mr. Rice will set a better example and often be in evidence for years to come at the Council's deliberations.



OFFICE BUILDING OF THE SENATORS, U.S. CAPITOL. JOHN M. CARRÈRE, ARCHITECT.

RECENT BRITISH BUILDINGS.

THE VICTORIA AND ALBERT MUSEUM.

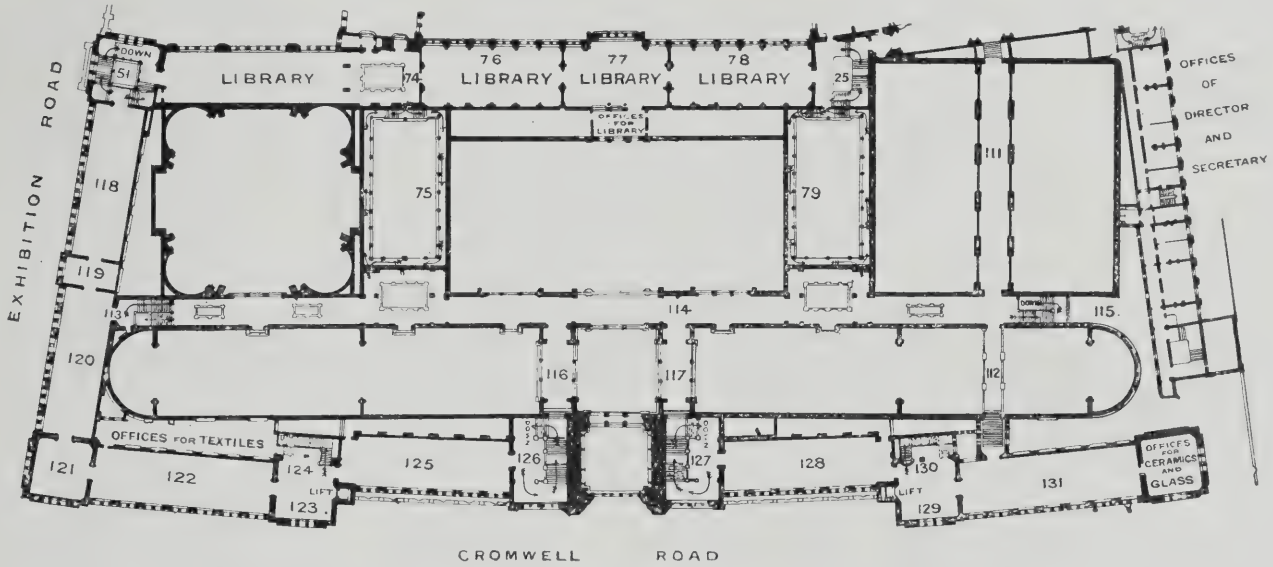
Sir Aston Webb, C.B., R.A., F.R.I.B.A., Architect.

The Victoria and Albert Museum was formally opened by his Majesty the King on June 26th. Designs for these buildings were invited in 1891 from six selected architects, and those submitted by Sir Aston Webb, C.B., R.A., were adopted. No decisive step was taken, however, until 1898, when the then Chancellor of the Exchequer, Sir Michael Hicks-Beach (now Lord St. Aldwyn), found himself in possession of a Budget surplus, from which he allotted a sum for the erection of the museum, and Sir Aston Webb was instructed to proceed with the plans. The foundation stone was laid by Queen Victoria on May 17th, 1899.

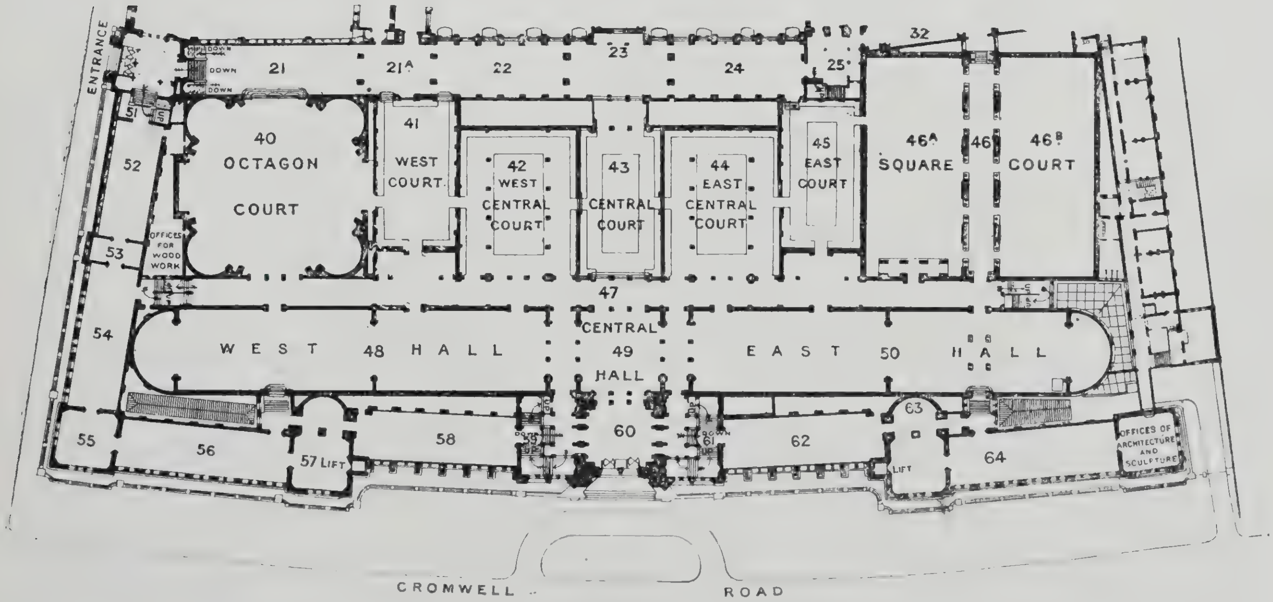
The new buildings have a frontage of 720 ft. to Cromwell Road, and 275 ft. to Exhibition Road. The total length of the perimeter of the site is occupied by three storeys of side-lighted galleries, the fourth-floor galleries being top-lighted, while the remainder of the site is covered with top-lighted courts. The total length of these galleries alone is three-quarters of a mile, and, including the long gallery of two floors that runs down the centre of the building, the galleries in the new buildings are just one mile in length, while the top-lighted courts have a superficial area of 6,500 square yards.

The Cromwell Road front, in the centre of which the main entrance is situated, is in a "flat" curve, following the line of the road, partly in order to secure a right angle at the corner of Exhibition Road, and partly to bring the building into line with the Natural History Museum. Other considerations that influenced the design were the great mass and height of the old Science building, which suggested the domes on the new, in order to preserve the scale.

The front is faced with specially selected Portland stone, red brick being freely introduced in frieze and piers in sympathy with the buildings already erected. The sculptured decoration includes statues representing thirty-two famous British artists and craftsmen, statues of ten craftsmen being on the Exhibition Road front, while facing Cromwell Road are, in the centre, ten painters; on the west flank, six sculptors, and on the east flank, six archi-

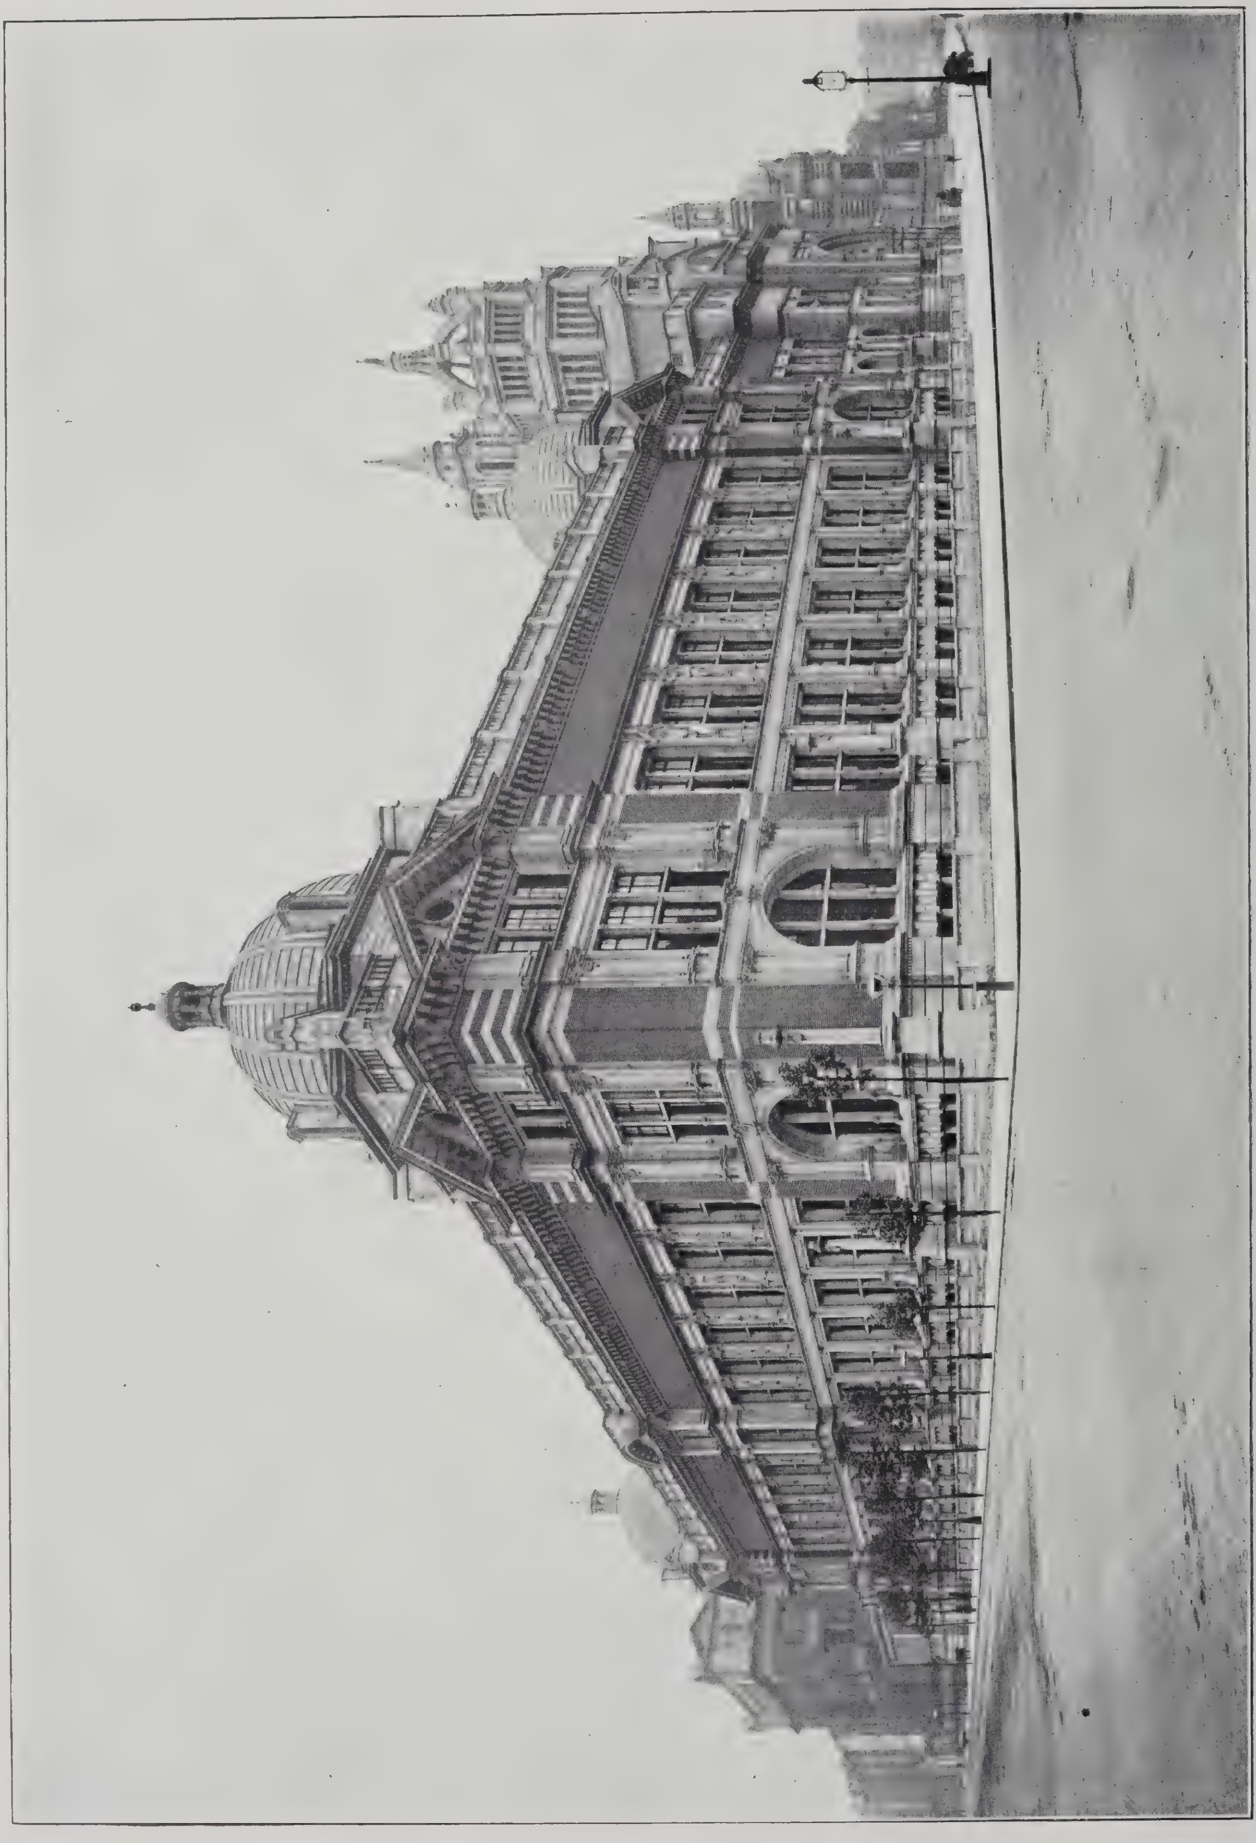


First Floor Plan.



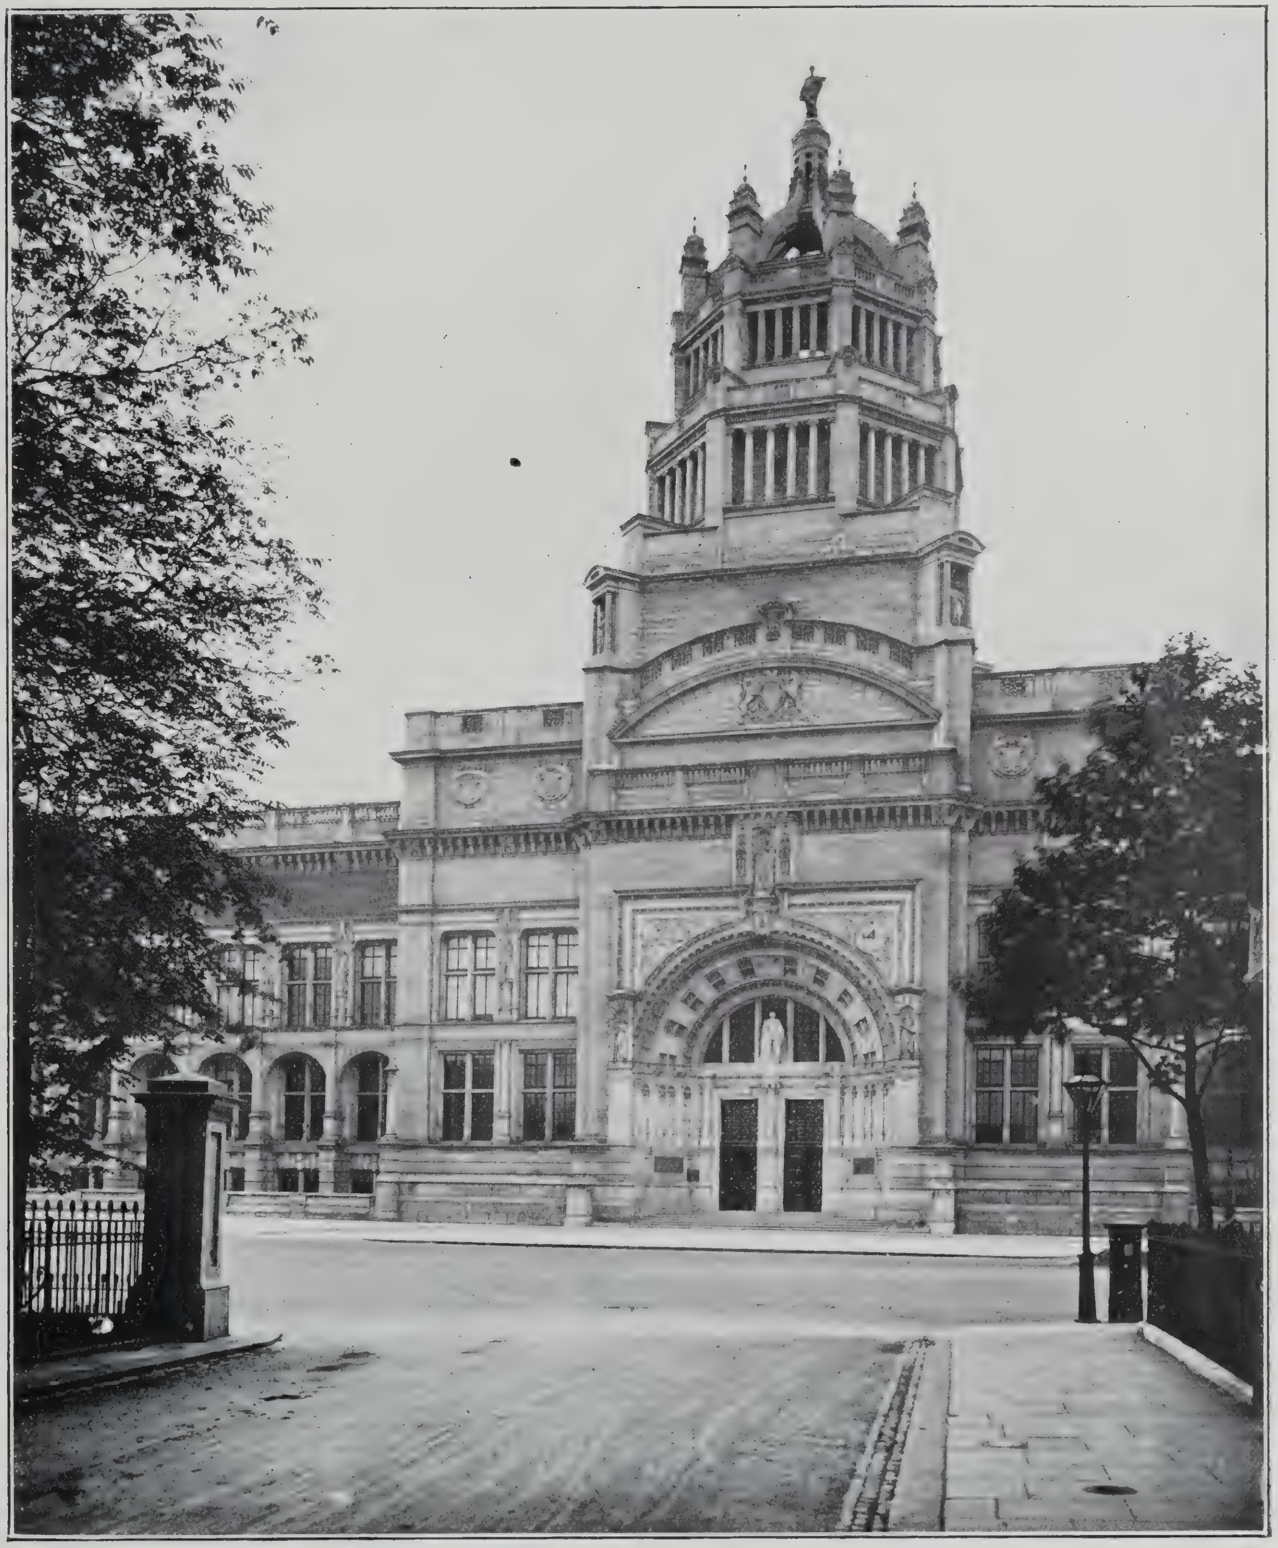
Ground Floor Plan.

THE VICTORIA AND ALBERT MUSEUM. SIR ASTON WEBB, C.B., R.A., F.R.I.B.A., ARCHITECT.



THE VICTORIA AND ALBERT MUSEUM: GENERAL VIEW. SIR ASTON WEBB, C.B., R.A., F.R.I.B.A., ARCHITECT tects. The statues of Millais, Watts, Leighton, and Constable were respectively executed by four students of the College of Art under Professor Lanteri; and two each of the other statues were entrusted to the following sculptors: Messrs. Lynn Jenkins, Paul Montford, S. W. Babb, G. Bayes, A. Broadbent, W. S. Frith, J. Gamble, E. G. Gillick, A. H. Hodge, A. B. Pegram, J. W. Rollins, R. Shepherd, A. G. Walker, and O. Wheatley. The figure of Fame on the lantern, and the two figures in the buttresses below—representing respectively Architecture and Sculpture—are by Professor Lanteri, while Mr. Alfred Drury, A.R.A., executed the statue of Queen Victoria, with her supporters, St. Michael and St. George; the statue of the Prince Consort, under the arch; and the figures of Knowledge and Inspiration, one on each side of the entrance; as well as the carved panels in the archivolt, each panel bearing, in letters of gold, a portion of a quotation from Sir Joshua Reynolds's Discourses: "The excellence of every Art must consist in the complete accomplishment of its purpose." The carved spandrels representing Truth and Beauty are by Sir George Frampton, R.A.; the statues of King Edward VII. and Queen Alexandra by Mr. Goscombe John, R.A., and the general architectural carving on the front has been done by Mr. W. S. Frith.

In planning the interior, the architect had by no means a free hand, as he was under the necessity of "linking up and adapting to the various levels of the old building." The vestibule, 40ft. by 40ft., runs up through two floors of the building. The walls are faced with Portland stone, and the ceiling is of teak, carved and inlaid with a holly motif. The floor, composed of Sicilian black, Irish red, and Swedish green marbles, was laid by Burke and Co., who also laid the mosaic pavement in the Persian Court and in the libraries, etc. Right and left of the vestibule, the staircases leading to the three floors of the side-lighted galleries are lined with Pavonazza marble in flat slabs. The columns are of Brescia, and the steps of Piastraccia. The walls of the galleries and courts, being intended for the exhibi-



THE VICTORIA AND ALBERT MUSEUM: MAIN ENTRANCE. SIR ASTON WEBB, C.B., R.A., F.R.I.B.A., ARCHITECT.

tion of objects, are of course kept perfectly plain, but "an attempt has been made to prevent weariness to the visitor by avoiding galleries of undue length, by providing vistas and glimpses through the building in passing, and by varying the sizes, proportions, and design of the various courts and galleries." The long gallery gives easy access to all the courts on each side, and the courts on the north side of the gallery neither oppose barriers to the visitor, nor confuse him as in a maze.

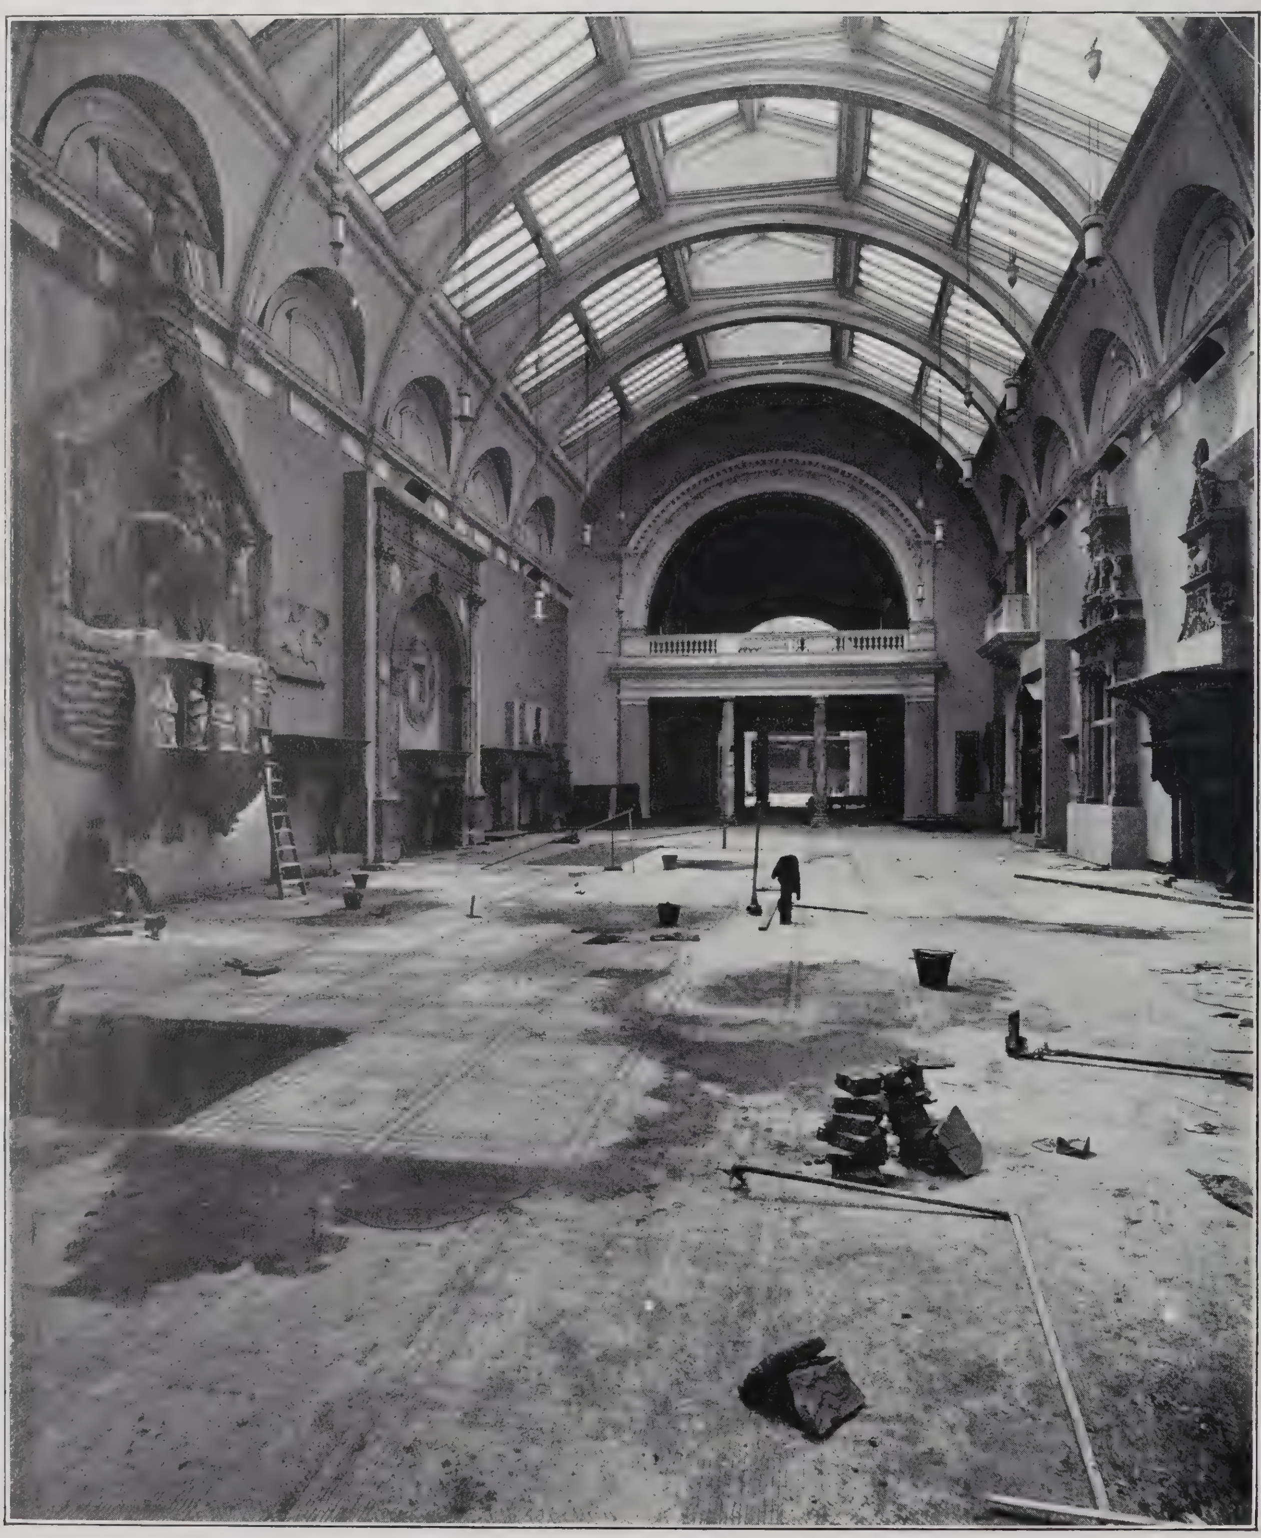
Flanking the domed central hall are the long eastern and western halls, 50ft. wide, in which the larger architectural exhibits are being placed. The west and east central courts leading from the central court that forms the main entrance to the older portions of the Museum, have their naves and aisles divided by arcades of Basilican types. The naves have flat ceilings, and the isles are vaulted. The great octagon court is 110ft. in diameter, and 65ft. high in the centre.

The galleries are 32ft. wide and 20ft. high, except in the lower ground floor, where they are 18ft. high. The windows are carried up close to the ceiling, and on this wall the glass area is equal to the wall area, so that the opposite wall is completely lighted. All the walls are lined with Cranham bricks, so that objects may be easily fixed to them, while all walls towards internal courts are built hollow.

The floors of the galleries are of polished teak, those of the courts being paved with marble mosaic, laid out in squares to facilitate the arrangement of cases and objects. In all there are 7,000 super yards of the mosaic, each yard representing 5,184 cubes. The whole was carried out by the Art Pavements and Decorations, Ltd.

Naturally, the heating and ventilating arrangements have been devised with extreme care. The heat will be derived from six Lancashire boilers, which have been placed in the basement between the north-west entrance and the College of Science. The Atmospheric Steam Heating Co.'s vacuum system of heating has been installed. Ventilation is on a plenum system, by means of which the air can be changed four times an hour, or more frequently if necessary.

The whole of the glazing on the roofs of the various courts, including the domes,



THE VICTORIA AND ALBERT MUSEUM: EAST HALL, LOOKING WEST. SIR ASTON WEBB, C.B., R.A., F.R.I.B.A., ARCHITECT.

was carried out by W. E. Rendle and Co., on their "Invincible" system mounted on moulded teak bars. The domes were glazed without the use of bent glass.

The general contractors for the foundations and up to the ground floor were Leslie and Co., of Kensington; and Holliday and Greenwood, of Brixton, erected the superstructure, executed all the woodwork, including the fine teak ceiling already mentioned, with its carved and inlaid holly decoration, and all the plumbing work.

The show cases, a range of which is illustrated below, made by Gardiner. Sons and Co., Ltd., have frames of steel, welded by the Oxy-Acetylene process, and covered with polished bronze facings. They are designed to be absolutely dust-proof. Nearly 200 of these metal-framed cases were supplied. The great advantages of these cases are that they are not liable to attacks of insects, are fireproof, and are of much less scantling than would be possible with woodwork.

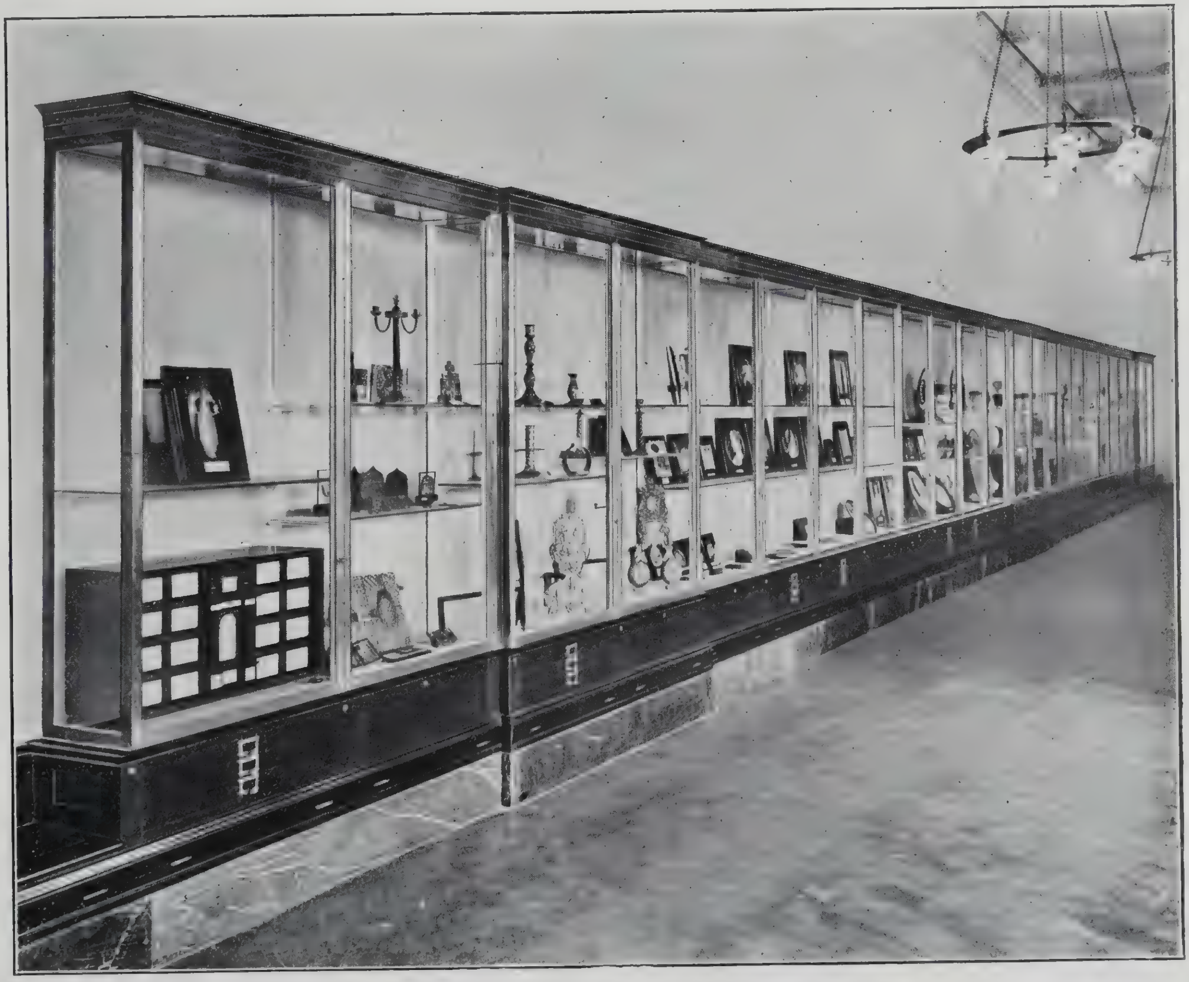
The electrical installation was carried out by T. Clarke and Co., and embodies approximately 5,000 lights, 75 miles of wire, and 95,000ft. of screw galvanised steel tubing. A feature of the wiring is that any of the cables can be easily withdrawn and new wires substituted without interfering with the decorations or flooring. The electric fittings made by the General Electric Co., comprise 300 six-light coronal electroliers in bronze designed by the architect. The lamps are Osram lamps of special shape. In addition, there are over 150 brackets of beaten bronze and many single pendants. The narrower galleries are lit by two-light pendants suspended over the cases, and the whole of the fixtures are arranged specially to light up the cases.

Water paint, mainly in subdued green and ivory tints, has been very largely used for the interior wall-colour effects.

The chief clerk of works was Mr. H. W. Tanner, and the general foreman was Mr. J. Farndon.

The following are some of the sub-contractors: Mack fire-resisting partition slabs, J. A. King and Co., London; stoneware pipes, etc., Leeds Fireclay Co. and Doulton and Co.; interior brick lining to walls, Sankey and Sons; cement, Associated Portland Cement Co.; electric installation, including the fixing of fittings, arc lamps, etc., T. Clarke and Co.; electric fittings, General Electric Co., Ltd., and Strode and Co.; ornamental metalwork and casements, Hart, Son, Peard and Co.; ironwork, St. Pancras Ironwork Co.; ironmongery and sliding doors, Chas. Smith, Sons and Co.; drainage, Burn Brothers; rain-water pipes, etc., W. Macfarlane and Co.; armoured fireproof doors, Mather and Platt; hydrants, Simpson and Co.; suspended ceilings and steelwork encasing, A. and J. Main, Ltd.; ornamental plasterwork, Bromsgrove Guild of Applied Arts, G. P. Bankart, J. Bickley; paint, R. Gay and Co., Ltd.; granite steps, Fenning and Co.; slates, Old Delabole Slate Co.; roof glazing, W. E. Rendle and Co.; general glazing, Pilkington Brothers; electric lifts, General Electric Co., R. Waygood and Co.; fireplaces, Shuffrey and Co.; service lifts, George Johnson; revolving doors, Van Kannell Revolving Door Co.; outside paving, Hard York Non-slip Paving Co.; marble, Farmer and Brindley, Walton, Goody and Cripps, Burke and Co.; show-cases, Gardiner, Sons and Co.; mosaic work, The Art Pavements and Decorations, Ltd.; the atmospheric steam heating system, by Jeffrey and Co.; expanded metal lathing for plasterwork, and three-inch mesh lathing for concrete reinforcement, Expanded Metal Co.; "Silex" stone for staircases, Brookes, Ltd.

The building is equipped with four hydraulic lifts, and three non-automatic basement ejectors are also supplied for various purposes. The fire service is supplied by two sets of Ellington's patent automatic injectors, which will discharge through hydrants a total of five hundred gallons of water per minute. The power for these services is supplied from the mains of the London Hydraulic Power Co.

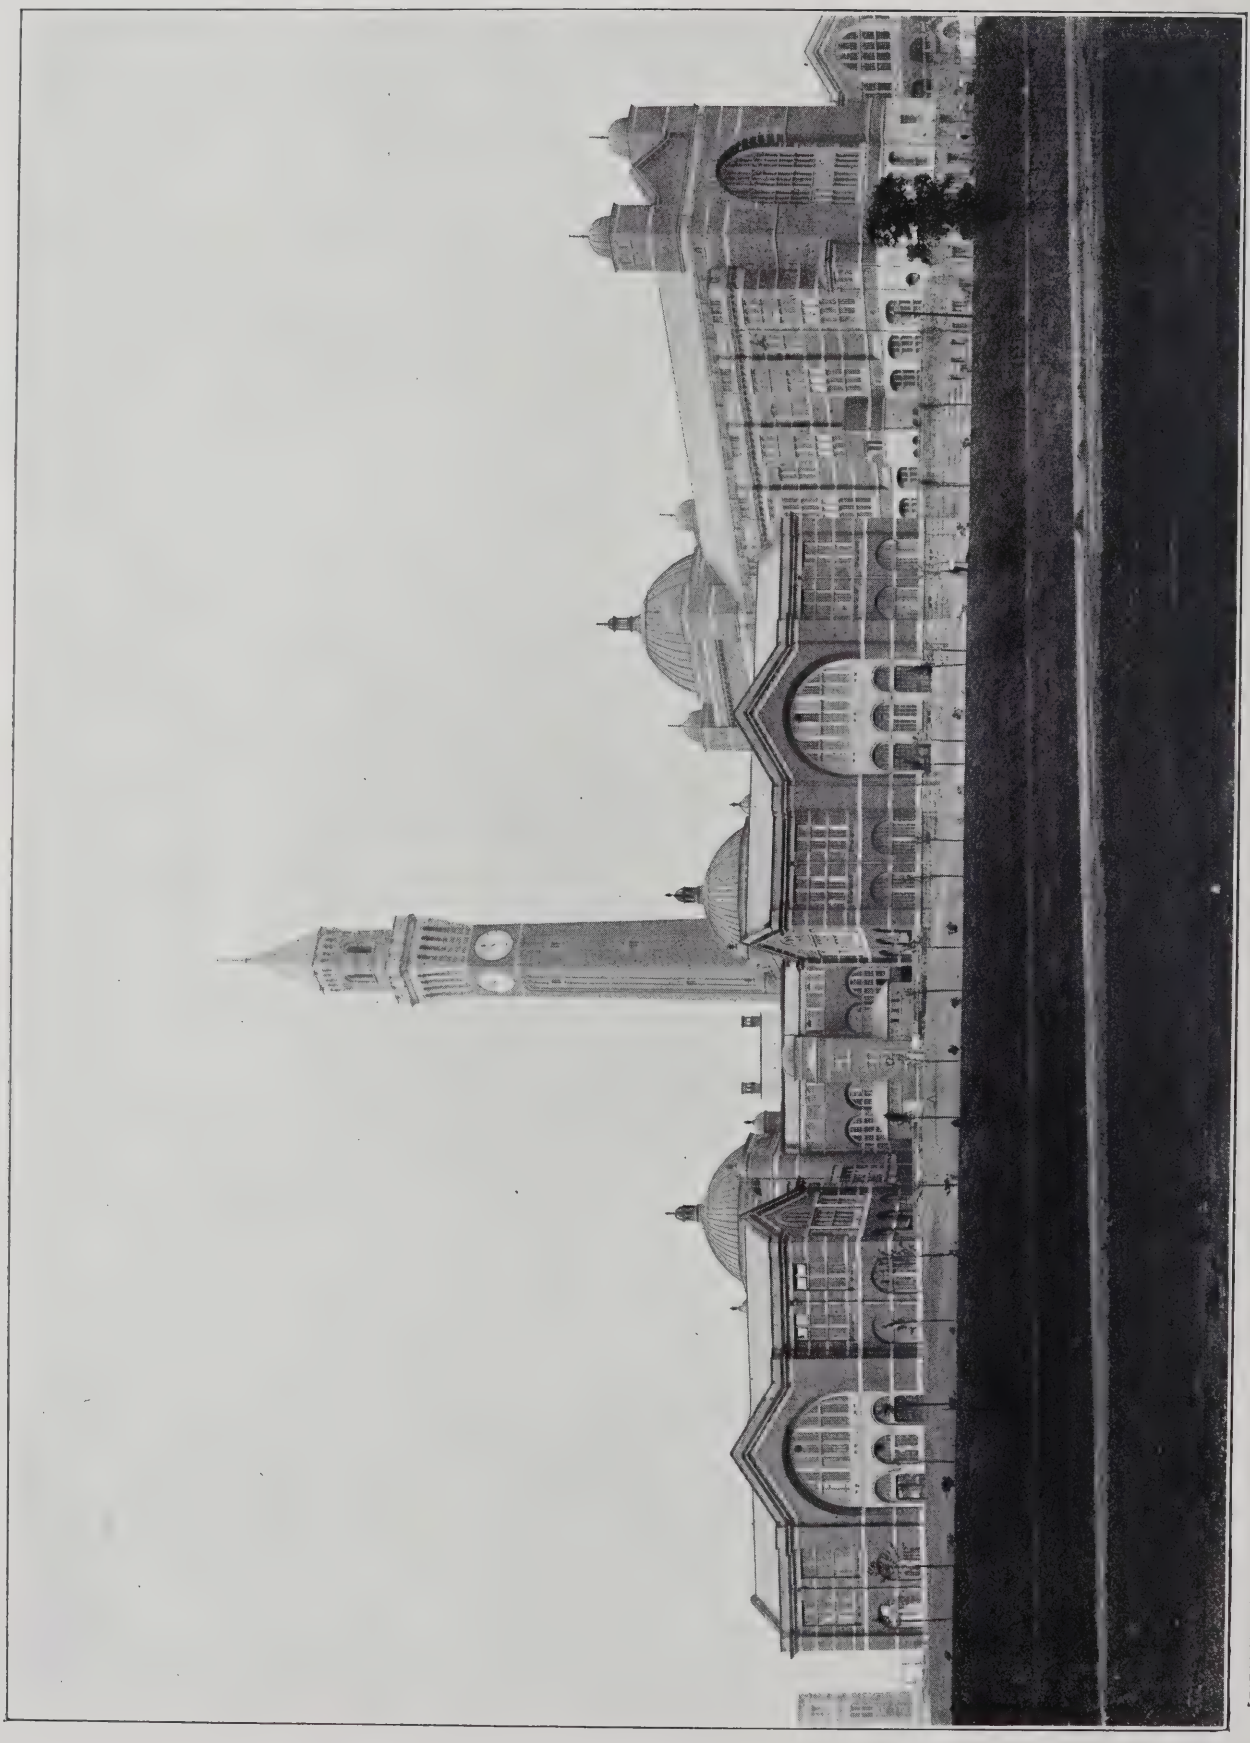


THE VICTORIA AND ALBERT MUSEUM: RANGE OF WALL CASES. SIR ASTON WEBB, C.B., R.A., F.R.I.B.A., ARCHITECT.

UNIVERSITY OF BIRMINGHAM.

Sir Aston Webb, C.B., R.A., F.R.I.B.A., and E. Ingress Bell, F.R.I.B.A., Architects.

The buildings are situated at Bournbrook, on a site of 39 acres, the gift of Lord Calthorpe, the main entrance being from University Road. In the centre of the frontage is the library, the gift of Mr. Charles Harding and family, with the Chamberlain Tower, the gift of an anonymous donor, commemorating the inception of the scheme by the Right Hon. Joseph Chamberlain. The tower forms a landmark for miles around. Facing this is the Great Hall, with the various blocks branching east and west. When completed there will be nine blocks; at present only six have been erected. Situated on the north-west portion of the site is the power-station, comprising engine and boiler-house, with steel-melting laboratories, foundry, smithy,



BIRMINGHAM UNIVERSITY: GENERAL VIEW OF BUILDINGS FROM BACK. SIR ASTON WEBB, C.B., R.A., F.R.I.B.A., AND E. INGRESS BELL, F.R.I.B.A., ARCHITECTS.

battery-house, gas plant, etc., and connected with the main building by a subway carrying the electric mains and pipes. The whole of the space formerly occupied as a rifle range, 14 acres in extent, has been laid out as a sports ground for cricket, football, hockey, and tennis.

The stone figures for the entrance are the work of H. Pegram, A.R.A. The ceramic frieze for the entrance was done by R. Anning Bell. The stone carving is the work of W. S. Frith. The general contractor for the main buildings was T. Rowbotham; the contractors for the tower were Waring & White, Ltd.; for the power station, Smith & Pitts; and for the grounds and roads, Currall Lewis, Martin.

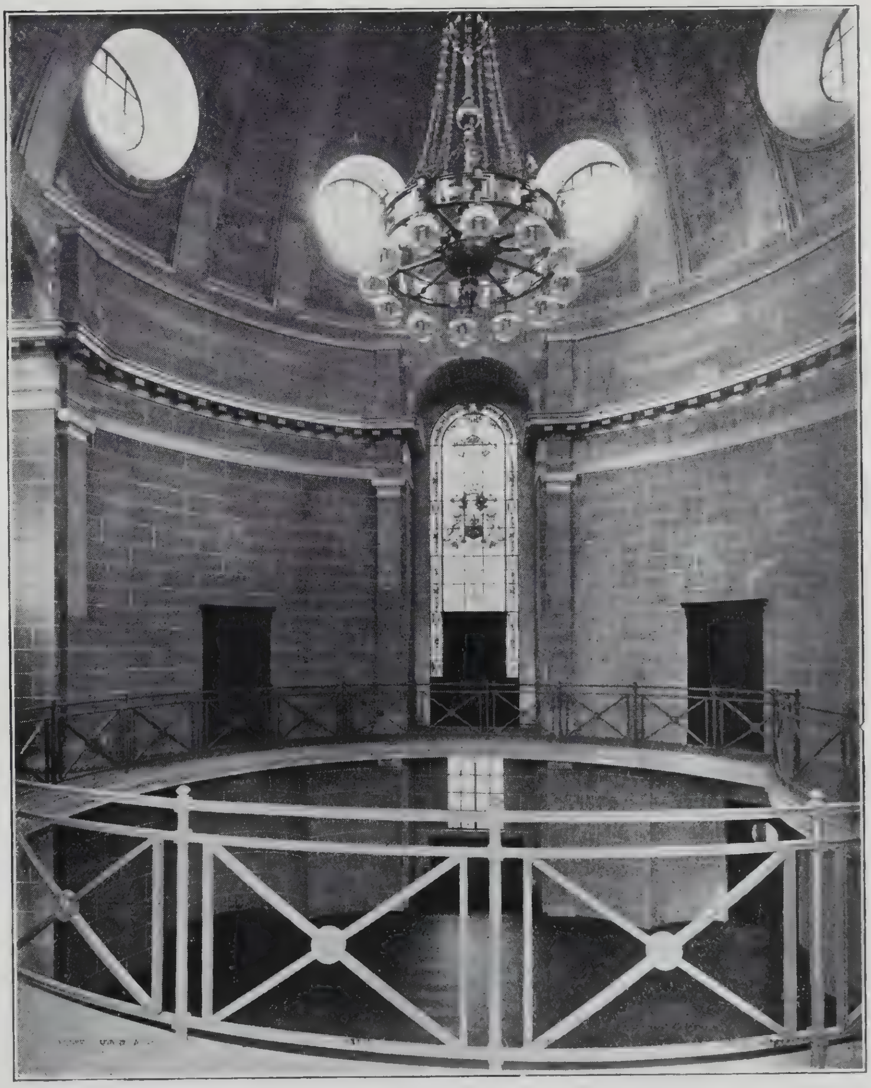
The quantity surveyors were Corderoy and Co.; surveyors for roads and grounds, Thomas and Bettridge; electrical engineers Henry Lea and Sons; experimental electrical engineer, G. A. Steinthal. The testing of steel and other materials was carried out by R. H. Harry Stanger, and the consulting engineer for the steelwork was E. L. Hall. The clerk of the works was H. Gray, and C. Lavender was foreman of the works. The following are some of the sub-contractors: Terra-cotta, Gibbs and Canning, Tamworth; asphalt, Pilkington and Co.; gates and railings, Hart, Son, Peard and Co., Ltd., and Bayliss, Jones and Bayliss. The entrance gates, by Hart, Son, Peard and Co., Ltd., are of wrought iron, with panels in cast bronze on either side showing the arms of the University. The gates are 13ft. 6in. high in the centre. The organ in the Great Hall was built by Norman and Beard, of Norwich. Facing bricks were supplied by The Accrington Brick Co.; building bricks, Hadley and Co. and Johern and Son; glazed bricks, Burmantofts Co. and the Leeds Fireclay Co.; stone (generally), the Darley Dale Stone Co.; York stone, Powson Bros.; stone granolithic paving, Stuart's Granolithic Co.; steelwork (steel construction, girders), Eastwood, Swingler, and Co., Hill and Smith, C. Wade and Co.; fireproof partitions, C. Picking and Co.; slates, the Tilberthwaite Green Slate Co., Kendal; casements and casement fittings, Henry Hope and Son; patent glazing and fittings, Henry Hope and Son; stoves, grates, mantels to architects' designs, Shuffrey and Co.; sanitary ware and fittings, Doulton and Co., W. George; marble flooring, Arthur Lee and Bros., Hayes; plasterwork (enriched), The Bromsgrove Guild; stained glass and leaded lights, T. R. Spence; art metal work (special designs), The Birmingham Guild of Handicraft, Bromsgrove Guild; electric light fixtures, The Birmingham Guild of Handicraft, Bromsgrove Guild; door furniture, Charles Smith, Sons and Co., throughout; marble-work (not floors), Arthur Lee and Bros.; lifts and cranes, Otis Elevator Co., G. Johnson (service lifts); laboratory fittings, benches, tables, etc., T. Rowbotham: clocks, clock bells, etc.; Joyce and Co. (clock), Taylor and Son (clock bells); special furnishings, Lucy and Co. (book fittings), Brown and Co. (laboratory fittings, i.e., taps, etc.), Hampton and Sons, W. Harris, Harris and Sheldon, Chamberlain, King and Jones, Lee, Longland and Co.; pavement lights, St. Pancras Ironworks Co., Ltd.; cement, Associated Portland Cement Manufacturers, Ltd., Greaves, Bull and Lakin; lime, Buxton Lime Co., J. Board and Co.

THE ASHTON MEMORIAL, LANCASTER. John Belcher, R.A., Architect.

A finer site could hardly be imagined than that chosen by the Right Hon. Baron Ashton for the memorial to his family. An outlook is obtained from the building far and wide over the country and adjacent coast line. Flights of steps lead to the terrace of the building, which is 70ft. above the park level. Carriage drives approach the steps from several directions.

The lower hall, which is 43ft. in height and diameter, is raised above the terrace by a few steps, and is approached through open loggias. Large arched openings with glazed screens give access immediately into the hall, which is lighted through these screens.

An octagonal dome covering in this hall is constructed of steel and concrete, and is being painted in fresco by Mr. George Murray, with subjects representing "The Arts," "Commerce," "Science," and "History." Piastraccia, Rosso Antico, and Tinos marbles, in a geometrical pattern, form the floor, which has brass grilles worked into the design to allow of the passage of heated air from the heating apparatus below. The floor was executed by Anthony Bell and Sons, of Lancaster, and the same firm also carried out the Cornish granite steps, approaches, and balustrades, and all the ornamental and other ironwork, including the staircases and brass handrails. The structural steelwork was made by Edward Wood and Co., Ltd. Two staircases in the angle turrets lead to the upper gallery or outlook, and to the main chamber, from which a more extensive view can be obtained. Another staircase leads from this hall to galleries, one at the base of the peristyle of the dome, and the higher one over the entablature. On this upper gallery are placed groups of statutary representinog "Commerce," "Science," and "Industry," by Mr. Herbert Hampton. The upper part of the drum of the dome is pierced by eight openings, which light the cupola over the main hall, which is all finished with stuc plaster with white joints. The whole of the stuc work was carried out by Geo. Trollope and Sons and Colls and Sons, Ltd., London, with British workmen entirely. From the terrace to the belvedere is 118ft., and to the top of the vane from the ground below the stairways 220ft. A sheet of water is enclosed by the winding flights of steps, and the niche under the landing is designed to accommodate a fountain group. Drinking fountains are placed at the foot of the turrets. The large electrolier seen in the interior view, and other electric fittings, were made by Veritys, Ltd.

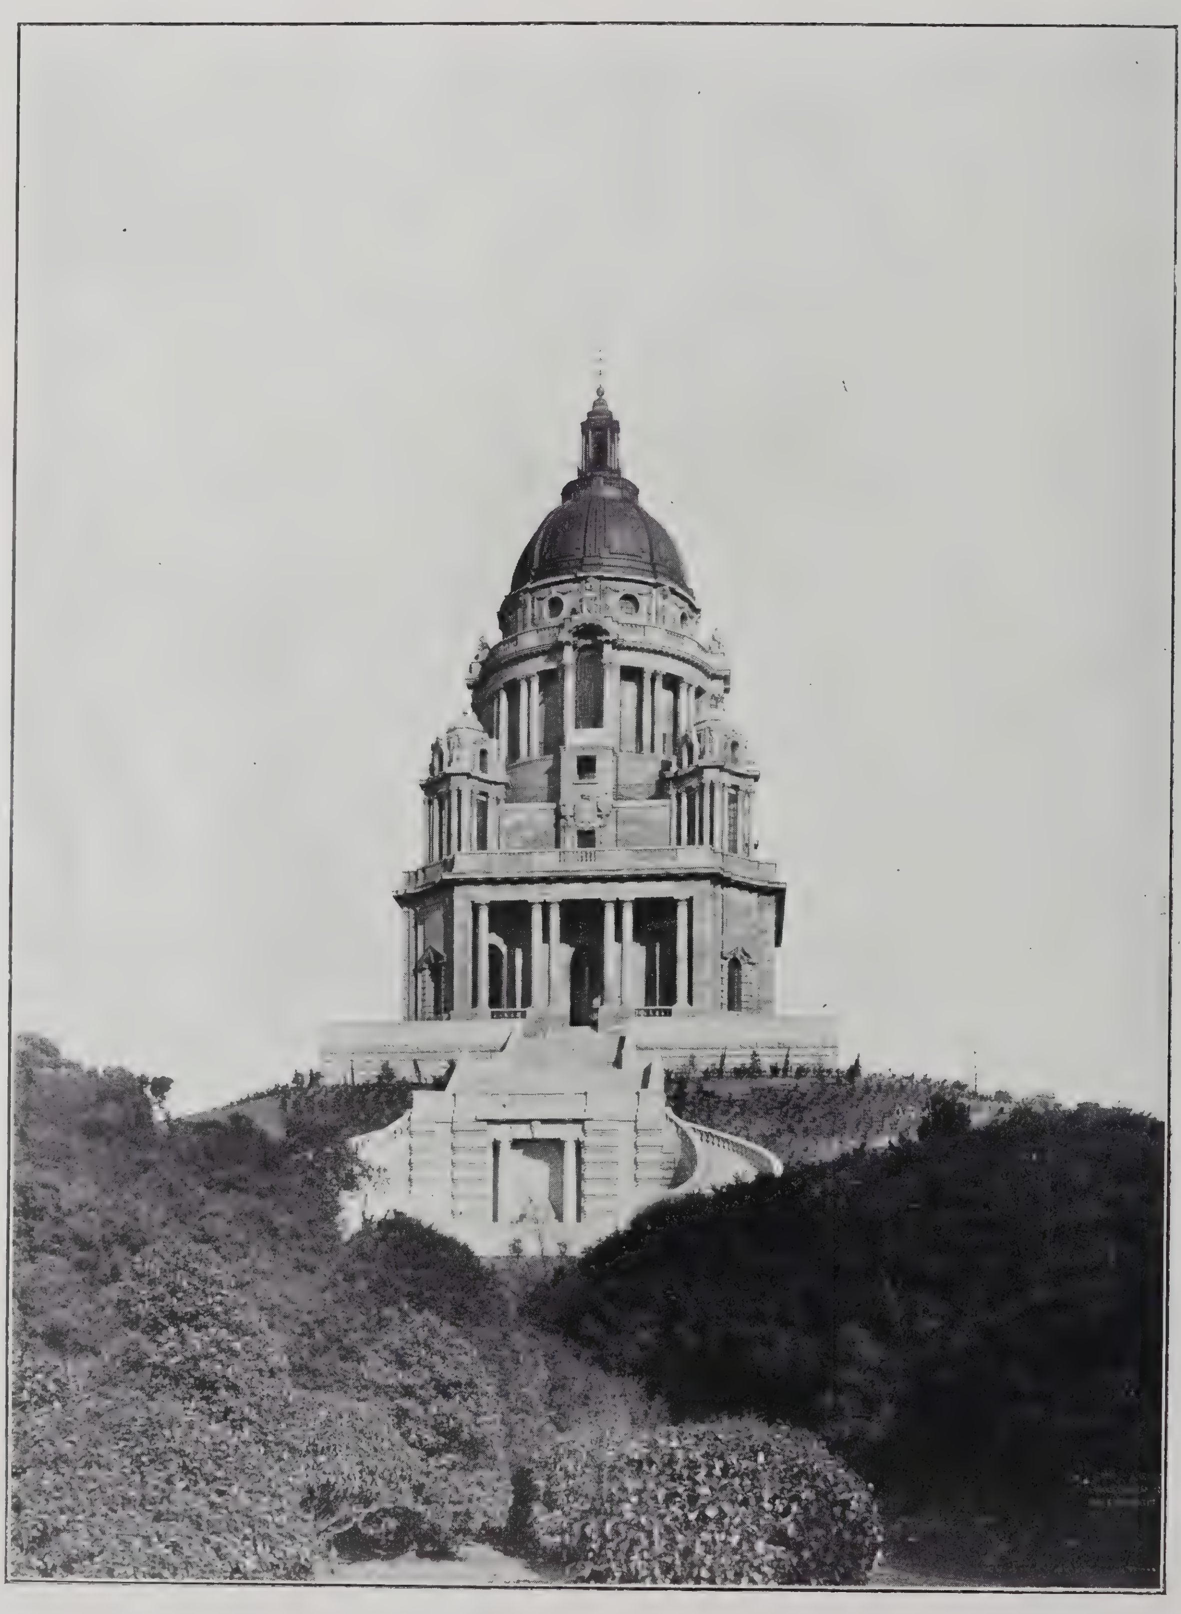


THE ASHTON MEMORIAL, LANCASTER: DETAIL OF INTERIOR FROM THE GALLERY.
JOHN BELCHER, R.A., F.R.I.B.A., ARCHITECT. *(For elevation, see next page.)*

The lower hall is to be used as a museum, while the upper will be a lounge and reading-room.

Portland stone has been used for the main building. The steps, approaches, etc., are built of grey Cornish granite. Robin Hood, Greenmoor, and Hopton Wood stone have all been employed as paving and steps.

Among the other sub-contractors were James Freeman, Sons and Co., Ltd., Penryn, who supplied the Cornish granite; H. H. Martyn and Co., Ltd., Cheltenham, who executed the carving; Henry Hope and Sons, Ltd., Birmingham, who supplied the metal casements; and W. Richardson and Co., Darlington, who installed the heating system. The Waring and White Building Co., Ltd., were the general contractors, and Mr. Thomas Gamage was clerk of the works.



THE ASHTON MEMORIAL, LANCASTER. JOHN BELCHER, R.A., F.R.I.B.A., ARCHITECT.

DUNKELD CATHEDRAL RESTORATION.

W. Dunn and R. Watson, FF.R.I.B.A., Architects.

When the choir of Dunkeld Cathedral was repaired in 1820, a new roof was added at a lower level than the original roof, and it fitted in a clumsy way against the east gable. It was finished on the inside with hideous plaster vaulting, jointed and coloured to represent stone. This vault comparatively low, and entirely destroyed he lofty proportion which must originally have belonged to the interior. At the same time, shortening the choir, a thick wall was built parallel to the east end. On his and the west walls galleries were erected, and the smaller area was filled with box pews. Recently it was found hat many of the old roof timbers were decayed so badly as to be beyond repair, and it was decided that a new roof was necessary. The late Sir Donald Currie thereupon offered to bear the whole expense of putting on a new roof, removing partition walls and galleries, and reseating the choir.

Nothing is known as to the form of the original roof, and the architects had only the outline of its pitch, shown against the gable, to guide them. This has been accepted, and the new roof has been built to the same slope. Its construction is interesting, the tie being placed high up to allow of the lofty proportion of the building being preserved. Of restoration beyond this there is little—removing plaster to expose beautiful walls or rubble or ashlar masonry, eking out damaged window jambs, filling up dowel holes. A few small additions in the way of furnishings have been fitted up—an oaken pulpit, oak screen, and communion table towards the east, with an ambulatory, and at the west a small gallery for the organ and choir, with a vestry underneath. The passages and the main body of the church are paved with old stones, but an oak woodblock floor was placed under the new pews, and a heating system has been installed. The Bromsgrove Guild were among the sub-contractors.

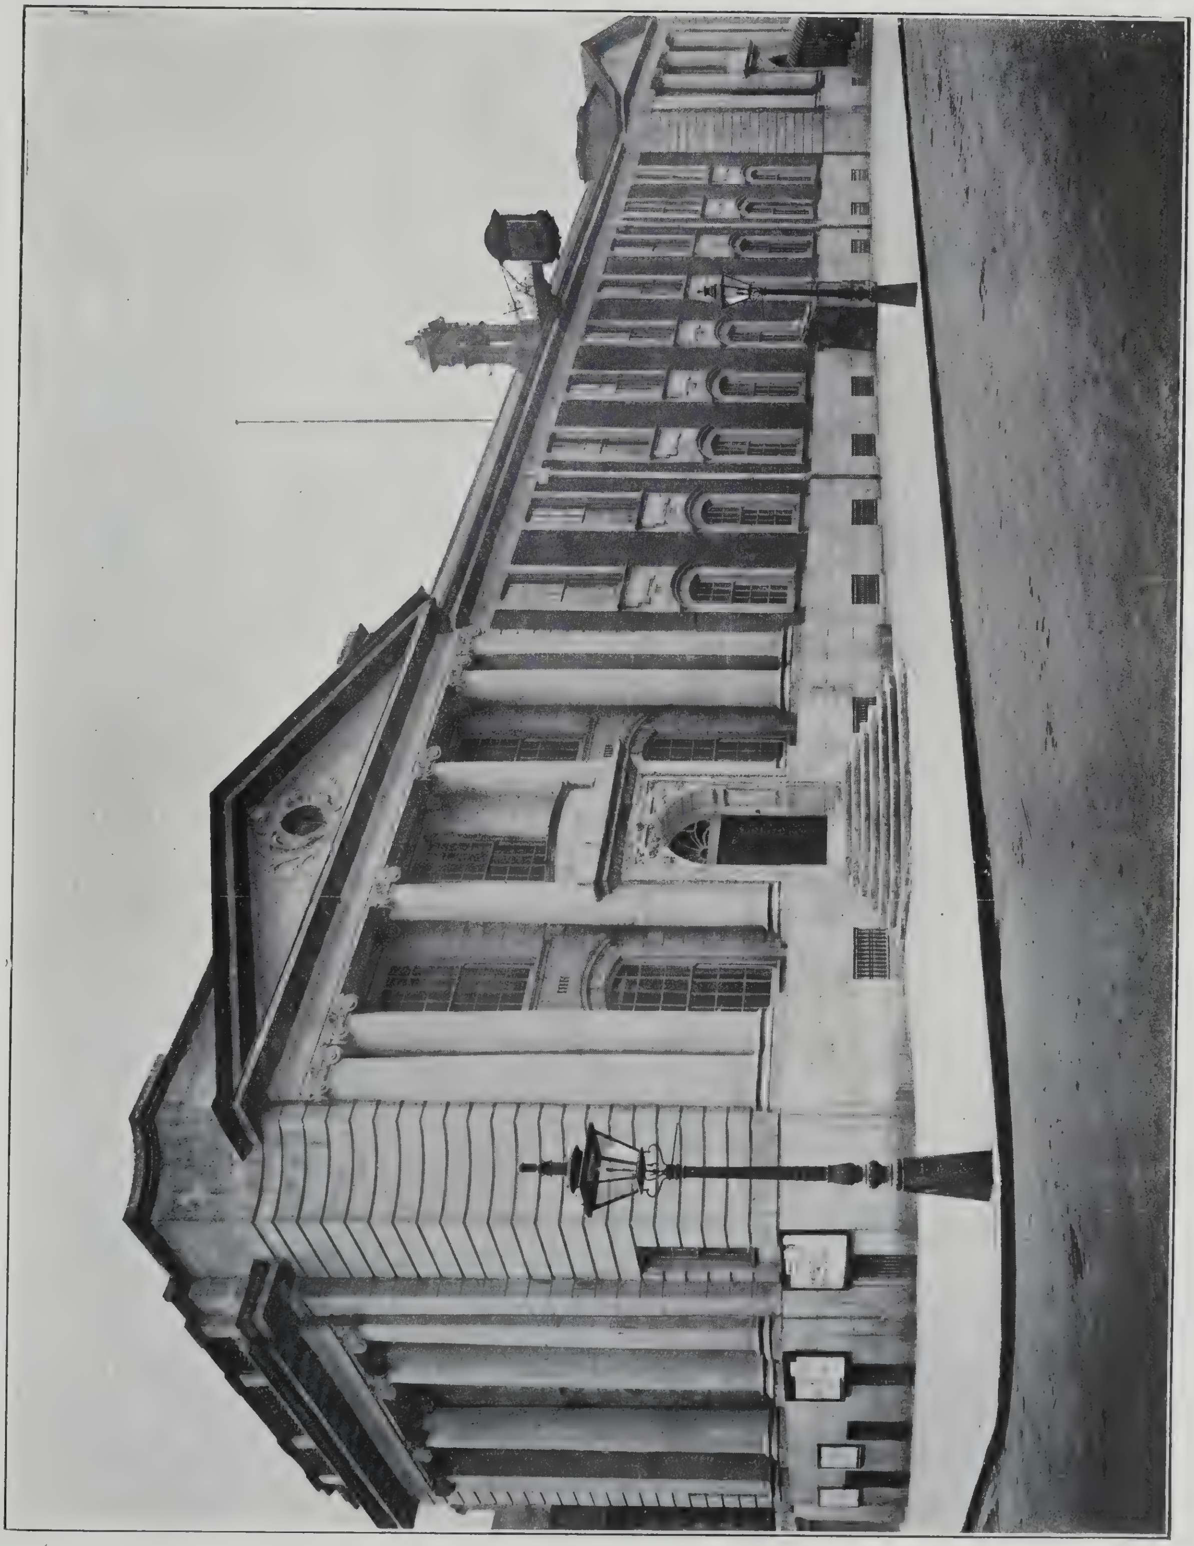
DUNKELD CATHEDRAL RESTORATION. W. DUNN AND R. WATSON, FF.R.I.B.A., ARCHITECTS.

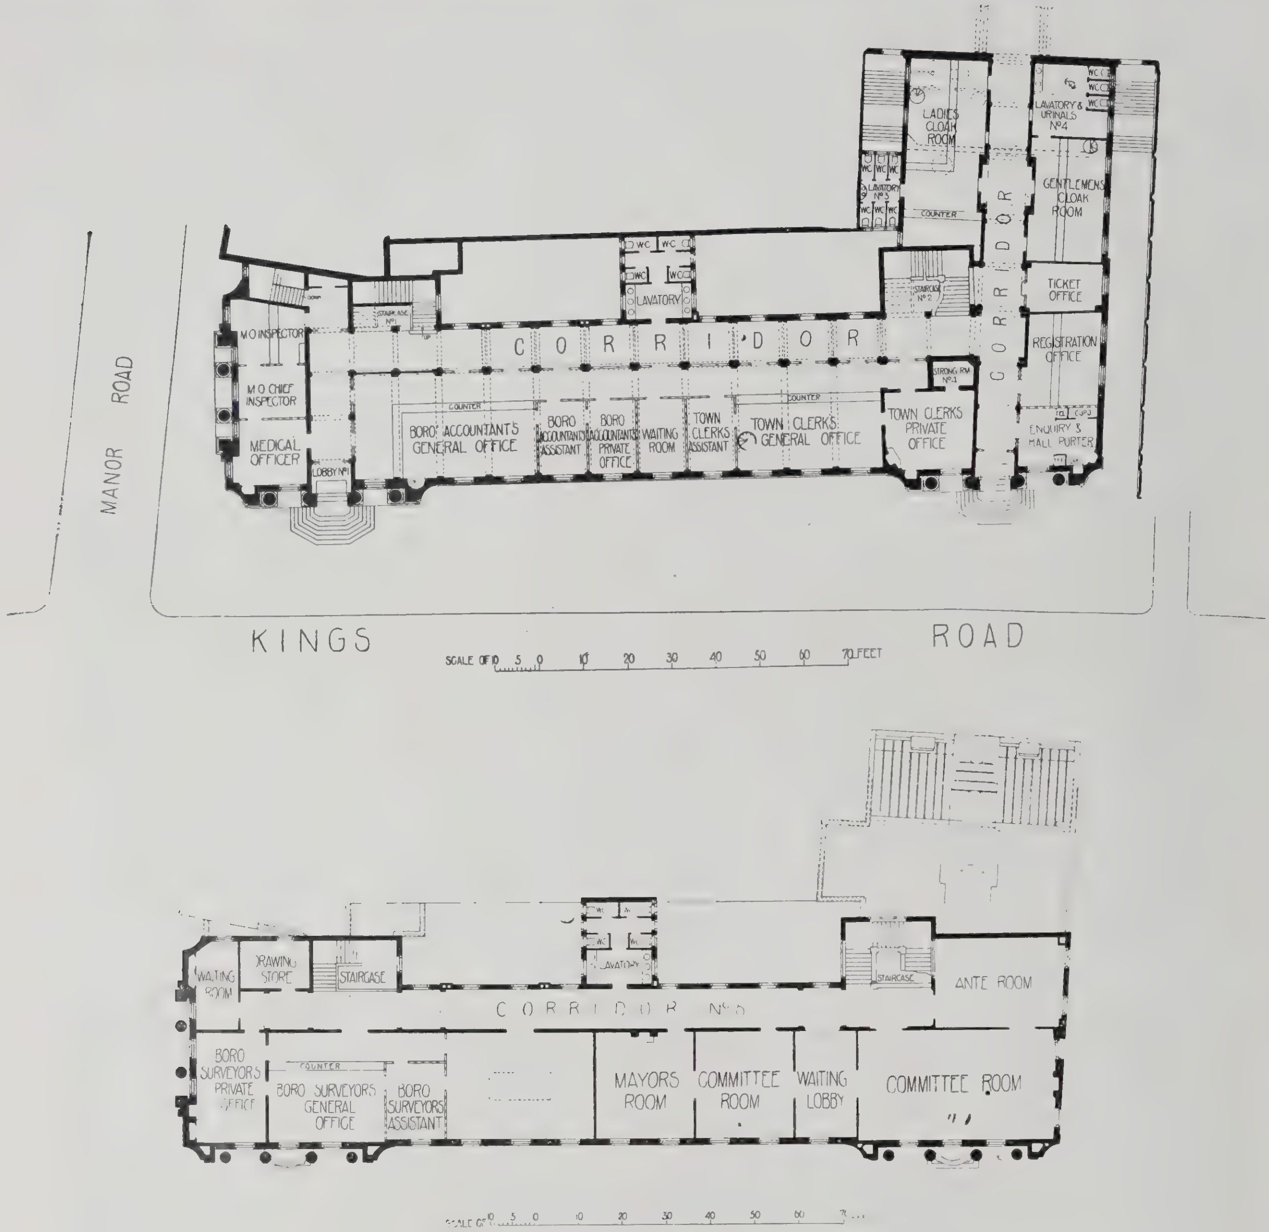
CHELSEA TOWN HALL EXTENSION. Leonard Stokes, F.R.I.B.A., Architect.

This building has been erected on the site of the old vestry offices and of the former entrance to the public baths in King's Road, Chelsea. It provides accommodation for the Council's officials. The existing Town Hall, to which this building is an addition, was erected from the designs of the late J. M. Brydon, and, as fas as practicable, the general detail of his work has been followed. The building is of brick, faced on the King's Road and Manor Street elevations with Portland stone and Cornish granite.

A large number of "Mack" partitions have been used, and the roofs have steel principals, and Mack slabs upon which the battening and slating are laid. The internal joinery is throughout of American walnut. The balustrading to the staircases is of polished Hopton Wood stone. The general contractor is A. N. Coles, of Plymouth. The carving is by A. Broadbent, Fulham. A. G. Cross, F.S.I., was the quantity surveyor employed by the Borough Council. The following are some of the sub-contractors: Portland stone, Williams and Co., Chelsea Bridge; fire-proofing construction, D. G. Somerville and Co., Westminster; "Mack" partitions and slabs, J. A. King and Co.; wall tiling, mosaic work, marble, Martin van Straaten and Co., London, E.C.; electric glazing, the British Luxfer Prism Syndicate, Finsbury; stoves and grates, gates and railings, Thos. Elsley, Ltd., London, W.; sanitary fittings, J. Bolding and Sons, Ltd., London, N.W.; electric light fixtures, Wright Bros., Chelsea; door furniture, N. F. Ramsay and Co., Westminster; electric wiring, the Electric and General Engineering Company, London, E.C.; heating and ventilating installations, James Gray, Chelsea; clock works and bell, Gillett and Johnston, Croydon; strong-room doors, Ratner Safe Co., London, E.C. ornamental iron grilles, the Falkirk Iron Co., London, E.C.; telephones, the National Telephone Company, Ltd.



CHELSEA TOWN HALL EXTENSION: GENERAL VIEW. LEONARD STOKES, F.R.I.B.A., ARCHITECT.



CHELSEA TOWN HALL EXTENSION: PLANS. LEONARD STOKES, F.R.I.B.A., ARCHITECT.

THE SELFRIDGE STORE, LONDON. R. Frank Atkinson, F.R.I.B.A., Architect.

A new scale has been given to the architecture of Oxford Street by the addition of the Selfridge Store. Its general conception is simple. Over the ground floor a giant colonnade is ranged, carrying a heavy cornice with a balustrading. Somewhat new in this country is the arrangement of the windows to the three floors embraced by the order. These are contained in cast-iron frames, designed to interfere with the light as little as possible. Cast-iron window frames are also used on the ground floor.

There are three basements, the lowest of which accommodates the heating, electric light, artesian well, motor rooms, etc. Storerooms for various departments occupy the sub-basement, while staff and dispatch accommodation is provided on the basement along with space for sale purposes. Sale rooms occupy the first four floors. Besides these the third floor has reception rooms, National rooms, post office, rail and steamship ticket office, and booking office for theatres, etc.

A restaurant is placed on the fourth floor with kitchen and offices, etc., and a roof garden is arranged over it. Nine passenger and two goods lifts, as well as six staircases, serve the building. The lifts are worked by electricity. A novel labour-saving apparatus is the gravity package conveyor for carrying parcels to the dispatch room in the basement.

Portland stone was used as the facing, and the whole building is of fireproof construction. The general contractors were Waring and White, Ltd. Asphalt work—some 180,000 sq. ft.—was done by Thomas Faldo and Co., Portland stone work by the Bath Stone Firms, Ltd., and F. J. Barnes, while the carving was executed by W. B. Fagan and W. Arrowsmith from models supplied by J. Else. Shanks and Co., Ltd., of Barrhead, Glasgow, supplied the sanitary fittings. The mosaic and marble flooring was done by Diespeker, Ltd. Malcolm and Allen, of Eglington Street, Glasgow, did the electric wiring. Veronese, Ltd., of Fulham, made and supplied between six and seven miles of 30-in. girt cornice in the short space of twelve weeks. This was fixed by Messrs. Henry Johnson and Sons, of London, and Liverpool, who also supplied 3,600ft. of same. This firm also executed the reinforced concrete staircases and plastering work. The plastering comprised about 5 acres of ceiling and 5½ acres of wall plastering. The whole of this work was carried out and completed in four months. The cast-iron work supplied by Messrs. Walter Macfarlane and Company, Saracen Foundry, Glasgow, comprises the shop windows and entrances on ground floor, and the entire bays, mentioned above, between the massive Portland stone columns from the first to the fourth floor. The feature of the shop windows is the very large polished plates which are possible by this method. Some of these are 19ft. 4in. long by 12ft. high. Spital and Clark carried out the art metal work, railings, handrails, etc., and provided some of the electric light fittings. Veritys, Ltd., also supplied some of these, as well as all the gas fixtures. The door furniture and

locks were supplied by Yale and Towne. Allen and Co. also made some of the railings, balusters, etc. The door openings in the division brick walls are generally 12ft. by 12ft., and are equipped with automatic steel rolling shutters of the Kinnear patent supplied by Arthur L. Gibson and Co. About 470 shutters have been erected.

Passenger and goods lifts were done by the Otis Elevator Company. Grinnell system of sprinklers was installed by Mather and Platt, Ltd.; the iron party wall doors were supplied by the St. Pancras Ironwork Co., Ltd. A vacuum cleaner and two sets of Ellington's patent automatic injectors are worked from power supplied by the London Hydraulic Power Company.

CENTRAL FREE LIBRARY, NELSON, LANCS.

J. Rigby Poyser and W. Brandreth Savidge, Architects.

This building is situated at the junction of Carr Road and Bootle Street. The site is a very restricted one for the accommodation required, which had to be confined as far as possible to the ground floor. The building externally is faced with rubbed Keighley and Catlow stone. The roofs are covered with Arfon green slates, with the exception of the roof over the hall, which is of concrete and steel covered with asphalt. The interior woodwork generally is in Danzig oak, as well as all furniture and fittings. The general contractor was Mr. T. E. Sugden, Keighley, and the following are some of the sub-contractors: Stone carvings, H. H. Martyn and Co., Cheltenham. Arfon green slates, W. Thornton, Bingley. Casements and fittings, Williams Bros. and Co., Chester. Patent glazing, W. H. Heywood and Co., Huddersfield. Stone, etc., Standard Range and Foundry Co. Sanitary ware and fittings, W. E. Farrer, Birmingham. Mosaic flooring, Diespeker and Co. Electric wiring, Carter and Co., Nelson. Modelled plasterwork, the St. George's Guild. Stained glass, Williams Bros. and Co., Chester, and Mr. R. Bennett, Manchester. Electric light fixtures, the General Electric Co., Manchester. Door furniture, James Gibbons, Wolverhampton. Gates, railings, etc., Jones and Willis, and the St. George's Guild. Stair treads, Patent Victoria Stone Co., Ltd. Heating and ventilating, James Stott and Co., Oldham. Special furnishings, Jas. Garvie and Son, Aberdeen. Ordinary furnishing, J. Wood and Co., Harrogate.

THE EDINBURGH LIFE ASSURANCE CO.'S NEW HEAD OFFICE.

J. M. Dick Peddie, Architect.

The façades of this building, which is situated at the south-east corner of George and Hanover Streets, are built of Portland stone, with the exception of the base course, which is of Norwegian granite. Messrs. Percy Portsmouth and H. S. Gamley, AA.R.S.A., were the sculptors employed, the former doing the figure of "Prudence" on the dome, and the latter the carving on the façades. Offices for the company are provided on the ground and part of the first floor and basement, while the remainder of the building is divided into chambers.

Reinforced concrete was used in the construction of the floors, which are finished with flooring-boards on shallow joists, except in the public office and basement, where doloment is laid on the concrete. Black and white rubber flooring has also been used in the entrance hall. Panels of rose numidian, separated by bands of pavonazzo marble, are used to finish the walls of the vestibule, and the columns in the public office are made of the latter marble with gilded caps.

The strong-rooms are equipped with Estler's patent fire-resisting and space-saving steel shelving.

The building is heated on the "Barker" patent system, and the public office has a special arrangement for extracting air; the incoming air is passed through an ozone-generating apparatus. The following were the principal contractors: Mason work, R. Thorburn and Son, Edinburgh. Joiner work, J. Lownie and Son, Edinburgh. Plumber work, Burn and Baillie, Edinburgh. Plaster work, David Fisher, Edinburgh. Glazier work, Dickson and Walker, Edinburgh. Heating, Mackenzie and Moncur, Edinburgh. Painting, Geo. Dobie and Son, Edinburgh. Marble work, Allan and Son, Edinburgh. Marble columns in public office, Galbraith and Winton, Glasgow. Electric lighting, Middleton and Townsend, Edinburgh (Mr. Norman A. Thomson, Edinburgh, consulting engineer). Electric fittings, Singer and Son, Frome; Grey and Son, Edinburgh. Lifts, Smith, Major, and Stevens, Ltd., London. Lift enclosure, Mackenzie and Moncur, Edinburgh. Grates, Gray and Son, Edinburgh; Fraser Walker and Co., Edinburgh. Furniture and furnishings, J. and T. Scott, Edinburgh.

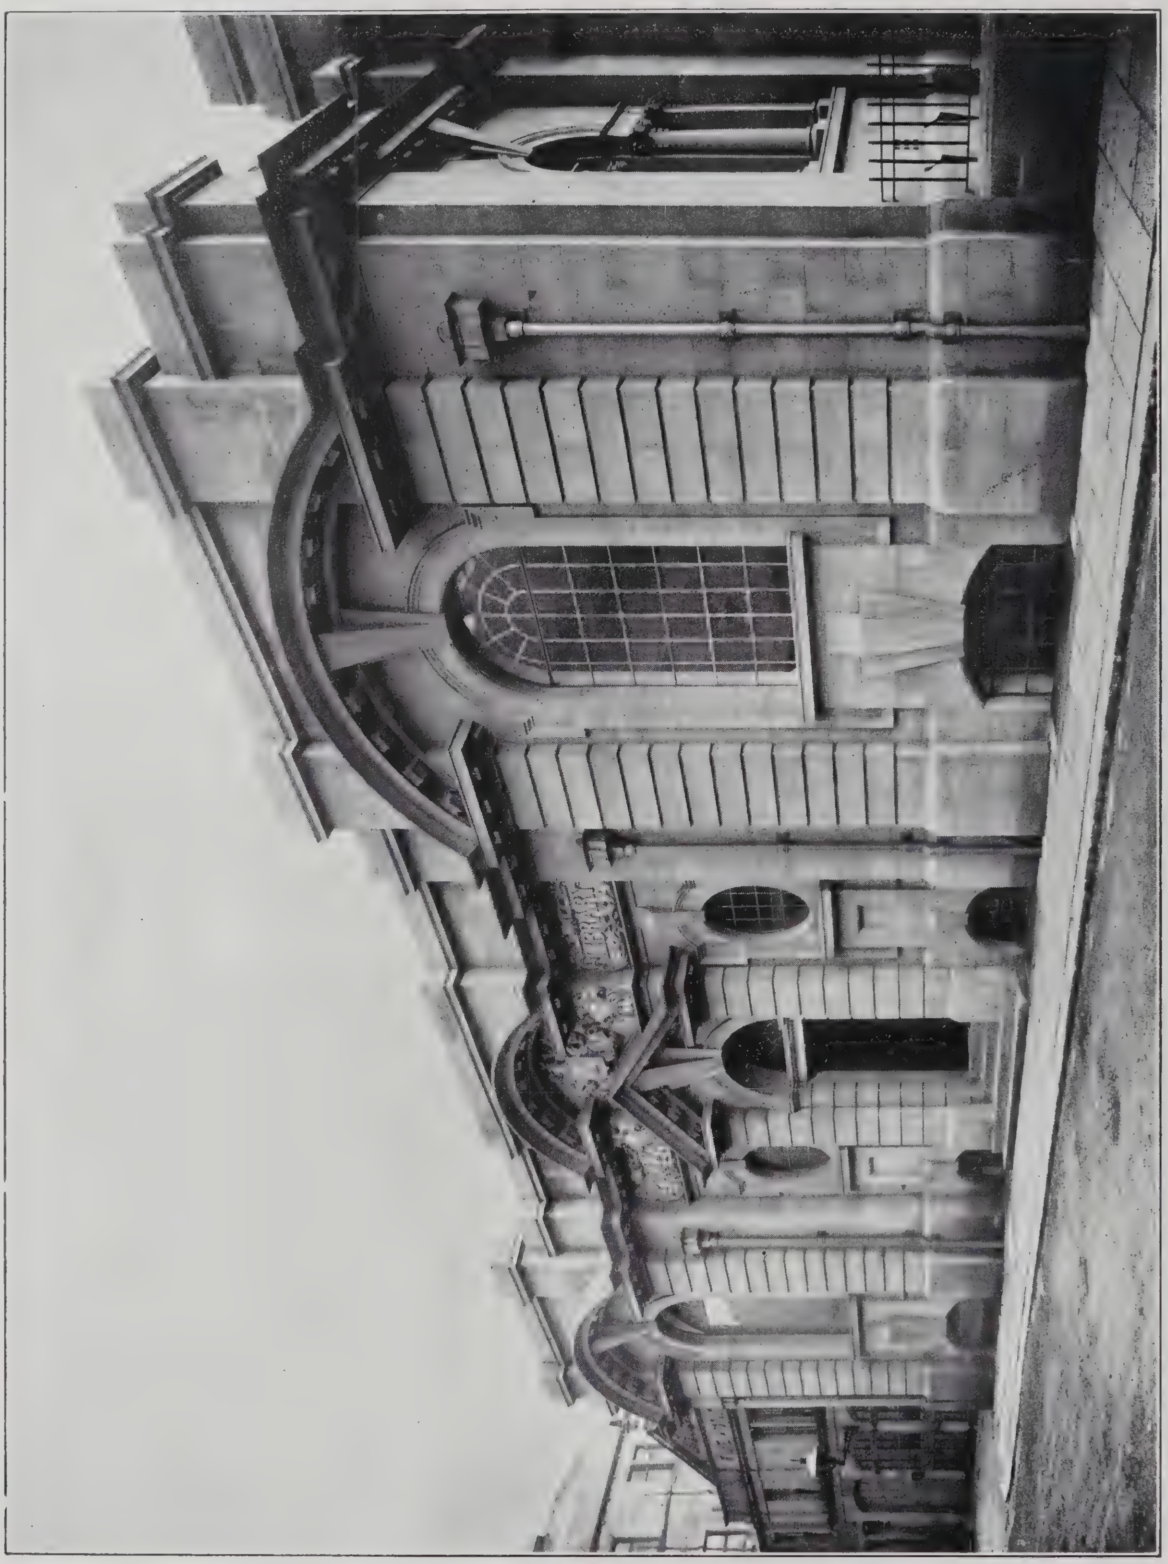
ADDITIONS TO GLASGOW CENTRAL STATION HOTEL.

James Miller, A.R.S.A., F.R.I.B.A., Architect.

The additions recently made to the Central Station Hotel consist of a large new dining saloon, billiard-room, and lounge, together with 120 bedrooms and suite rooms. The three large apartments are situated on the first floor.

The dining saloon is 105ft. long by 48ft. wide and 30ft. high, and is panelled in Italian walnut to the height of 14ft., the carving being in lime tree. The walls above are panelled in Keene's cement with carton pierre ornament, the ceiling being finished in fibre plaster. The main columns are of pavonazzo marble with the exception of the two at musicians' gallery at end of dining saloon, shown in photograph, which are of Greek cipollino. The fender shown in one of the fireplaces in the dining saloon is not the permanent one.

The lounge is elliptical in shape, the shape being determined by the outline of buildings underneath, which are occupied as offices in connection with the station accommodation. This apartment is 66ft. long by 27ft. wide, and is panelled its full height in Austrian oak. The ceiling is of fibre plaster. The small quadrant of a circle which forms part of the lounge in the angle existed previous to these altera-



CENTRAL FREE LIBRARY, NELSON. JOHN R. POYSER, AND W. BRANDRETH SAVIDGE, A.R.I.B.A., ARCHITECTS.

tions, but its external finishings were renewed to correspond with the new lounge. The floor of the lounge is executed in coloured marbles.

The wood-carving of lounge and dining saloon was executed by Messrs. H. H Martyn and Co., Cheltenham.

The fibre plasterwork in lounge was executed by the Bromsgrove Guild, and the ornamental work of plaster ceiling in dining saloon was executed by Messrs. George Jackson and Sons, London.

The contractors for the whole works were Messrs. P. and W. Anderson, Glasgow, and the following were their subcontractors: Joiner work, Mr. John Cochrane, Glasgow. Plumber work, Mr. Wm. Anderson, Glasgow. Plasterwork, Messrs. McGilvray and Ferris, Glasgow. Slater work, John Anderson, Glasgow. Painter work, Messrs. C. Carlton and Son, Glasgow, and Messrs. John Orr and Sons, Glasgow, Steel casements, Messrs. H. Hope and Sons, Birmingham. Marble work, Messrs. Galbraith and Winton, Glasgow. Tile work Messrs. Haddow, Forbes and Co., Glasgow. Heating and ventilating, Messrs. Ashwell and Nesbit, Ltd., Glasgow and Leicester. The glass work of cupola in lounge was executed by Messrs. Oscar Paterson and Co., Glasgow. The buildings are of steel construction throughout, the contractors for the steelwork being the Motherwell Roof and Bridge Co. The sanitary fittings throughout the building were supplied by Messrs. Doulton and Co. and Messrs. Shanks and Co. Architect, Mr. James Miller, A.R.S.A., 15, Blytheswood Square, Glasgow.

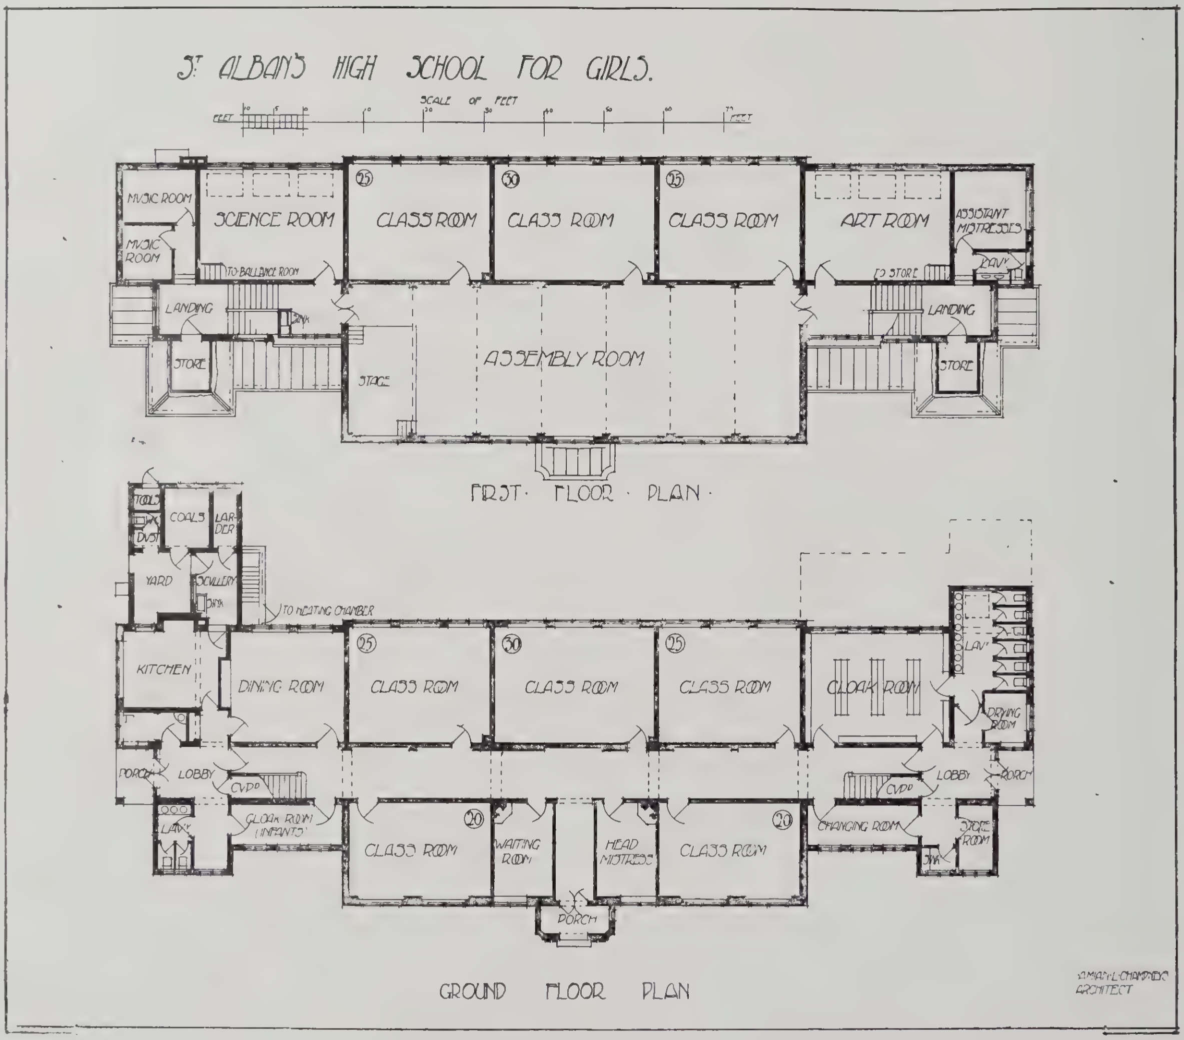
ST. ALBANS HIGH SCHOOL FOR GIRLS AMIAN L. CHAMPNEYS, ARCHITECT. *(See page 644.)*

ST. ALBANS HIGH SCHOOL FOR GIRLS. Amian L. Champneys, Architect.

This new school is situated at Hall Place, St. Albans, Herts, and the main front faces south-west. The sub-soil is clay and gravel. A playing-field adjoins the building on the south-east side, and there is a gravelled playground at the back of the building. The main pupils' entrance is at the south-east end, and there is a Kindergarten entrance at the north-west end. The main entrance for the public is in the centre of the front. The building, which accommodates two hundred girls, supersedes the old school building in Holywell Hill, St. Albans. The accommodation comprises seven class-rooms, Kindergarten room, dining-room, laboratory and balance room, art room, and large central hall (75ft. by 25ft.), with stage for theatricals, etc. The facing bricks, 2½in. thick, are in two "colours," the quoins at angles and openings being light red, and the remainder dark red. The stonework is of Bath stone. The staircases and landings are of reinforced concrete. The roofs are covered with red sand-faced tiles, with, in parts, interlocking tiles. The doors are of Columbian pine, stained. Pitch-pine wood blocks are laid on the ground floor, except in the cloak rooms, lavatories, etc., where Doloment is used. The upstairs floors are boarded. The laboratory fittings are of oak, with teak tops. The lighting throughout is by means of incandescent gas. The foundations were prepared by Messrs. Webster and Cannon, of Aylesbury, and the superstructure was built by Messrs. C. Miskin and Sons, St. Albans. Some of the sub-contractors were: Asphalte, the Limmer Asphalte Co., Ltd.; facing bricks, in two colours, Kendall's Brick and Lime Co., Radlett, Herts; carved work, R. Bridgeman, Lichfield; fireproof partitions, Messrs. J. A. King and Co. (Mack partitions); interlocking tiles, Messrs. H. J. and C. Major; casement fittings and door furniture, G. W. Pridmore and Son, Coventry; stoves, grates, etc., Messrs. Rosser and Russell, Charing Cross, and Messrs. T. Elsley, Ltd., London, W. (the latter firm supplying also the rain-water heads); sanitary ware and fittings, Doulton and Co., Ltd.; special flooring, British Doloment Flooring Co.; gas fixtures, Sugg and Co.; railings, Messrs. C. Hall and Son, West Hampstead; folding gate, Bostwick Gate Co.; heating and ventilating, Rosser and Russell, Charing Cross.



AMIAN L. CHAMPNEYS, ARCHITECT.

The accommodation comprises seven class-rooms, kindergarten room, dining room, laboratory and balance room, and large central hall with stage.

ST. PETER'S SCHOOL, WESTON-SUPER-MARE.

W. H. Ward and Gerald Cogswell, AA.R.I.B.A., Architects.

This school is built in an eight-acre field on the hill behind Weston-super-Mare. The site has a gentle slope to the south, overlooking the bay, and is sheltered towards the north-east by woods. The main front faces south, and the principal class-rooms and dormitories are planned with that aspect, the space facing north being utilised for communicating-corridors, changing-rooms, and lavatories, dining-hall, and kitchen offices. The subsoil is limestone rock. The building is erected directly on this, and excavated limestone was used in the walling, a further supply being obtained from an adjoining quarry. The dressings are of Monk's Park Bath stone. Cattybrook red bricks have been used for the external walls, and the lavatories have a salt-glazed dado. The chimneys are of specially-made 2in. red bricks, pointed with white mortar. The roofs are covered with brindled Broseley tiles, and the external woodwork is of memel, painted white. Internally, the work has been kept extremely plain. Most of the woodwork in the school portion is stained and varnished, and plain iron mantels have been adopted; but the dining-hall has a moulded wood ceiling and a moulded wood mantel. The buildings are heated by low-pressure hot water from a furnace in the basement, and there is a separate furnace for supplying hot water to baths, etc. The ventilation is by means of fresh-air inlets, the incoming air being warmed by radiators, while the outlet is by means of tubes connected to an electric-fan chamber in the roof. Electric lighting is installed. The accommodation is for

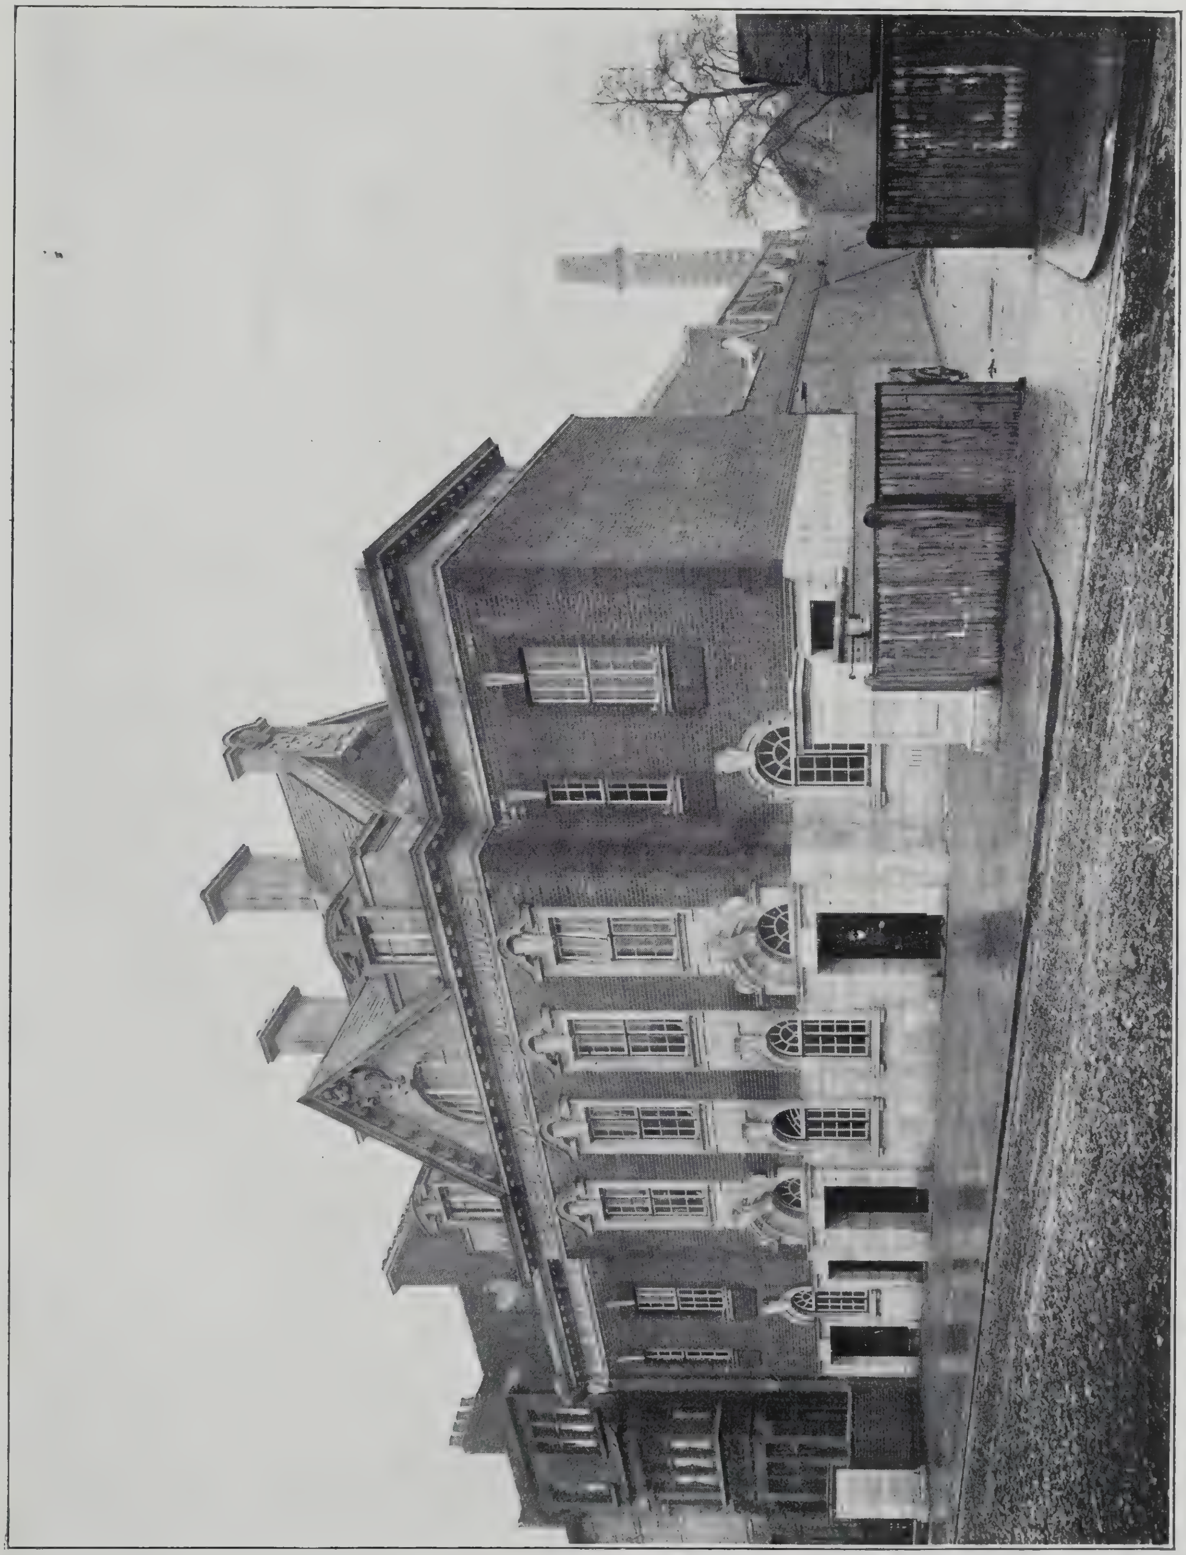
thirty boarders and thirty day boys. The general contractors are Messrs. R. Wilkins and Sons, Bristol. Several Mack partitions (J. A. King's) have been erected. The main floors have been laid by Acme Woodblock Flooring Co.; others are paved with Carter's red pressed tiles. The plumbing and sanitary work was done by Messrs. Rowe Bros. and Co., Bristol, who, with Messrs. Shanks and Co., supplied the sanitary ware and fittings. Folding partitions were supplied by Messrs. Peace and Norquoy, Manchester. The heating and ventilating are by Messrs. J. Jeffreys and Co., Westminster.

HAMMERSMITH PUBLIC BATHS. J. Ernest Franck, Architect.

The Public Baths and Washhouses built for the Borough Council of Hammersmith occupy a site that is of irregular shape, though of ample area. While the total depth of the site is about 520ft., the frontage on the east side is only 70ft., whereas the width on the west is nearly twice as great; and the difficulties of planning were increased by the necessity for observing certain prescriptive requirements with respect to rights of light, as well as several conditions of an agreement between the London County Council and the Borough Council.

The accommodation comprises: First-class swimming pond, 105ft. by 34ft.; second-class swimming pond, 100ft. by 30ft.; sixty-three slipper and lassar baths; public washhouse fitted with thirty washing stalls, thirty drying horses, and three hydro extractors, ironing room, establishment laundry, boiler-house with coal bunkers, engine room, engineers' workshop and store, three ticket offices, male and female staff mess rooms, club and waiting rooms, superintendent's residence, and engineer's residence.

The bold design of the main arched-roof principals over the first-class pond was rendered possible by the adoption of reinforced concrete. The use of steel stanchions would have necessitated projections from the wall, but with the adoption



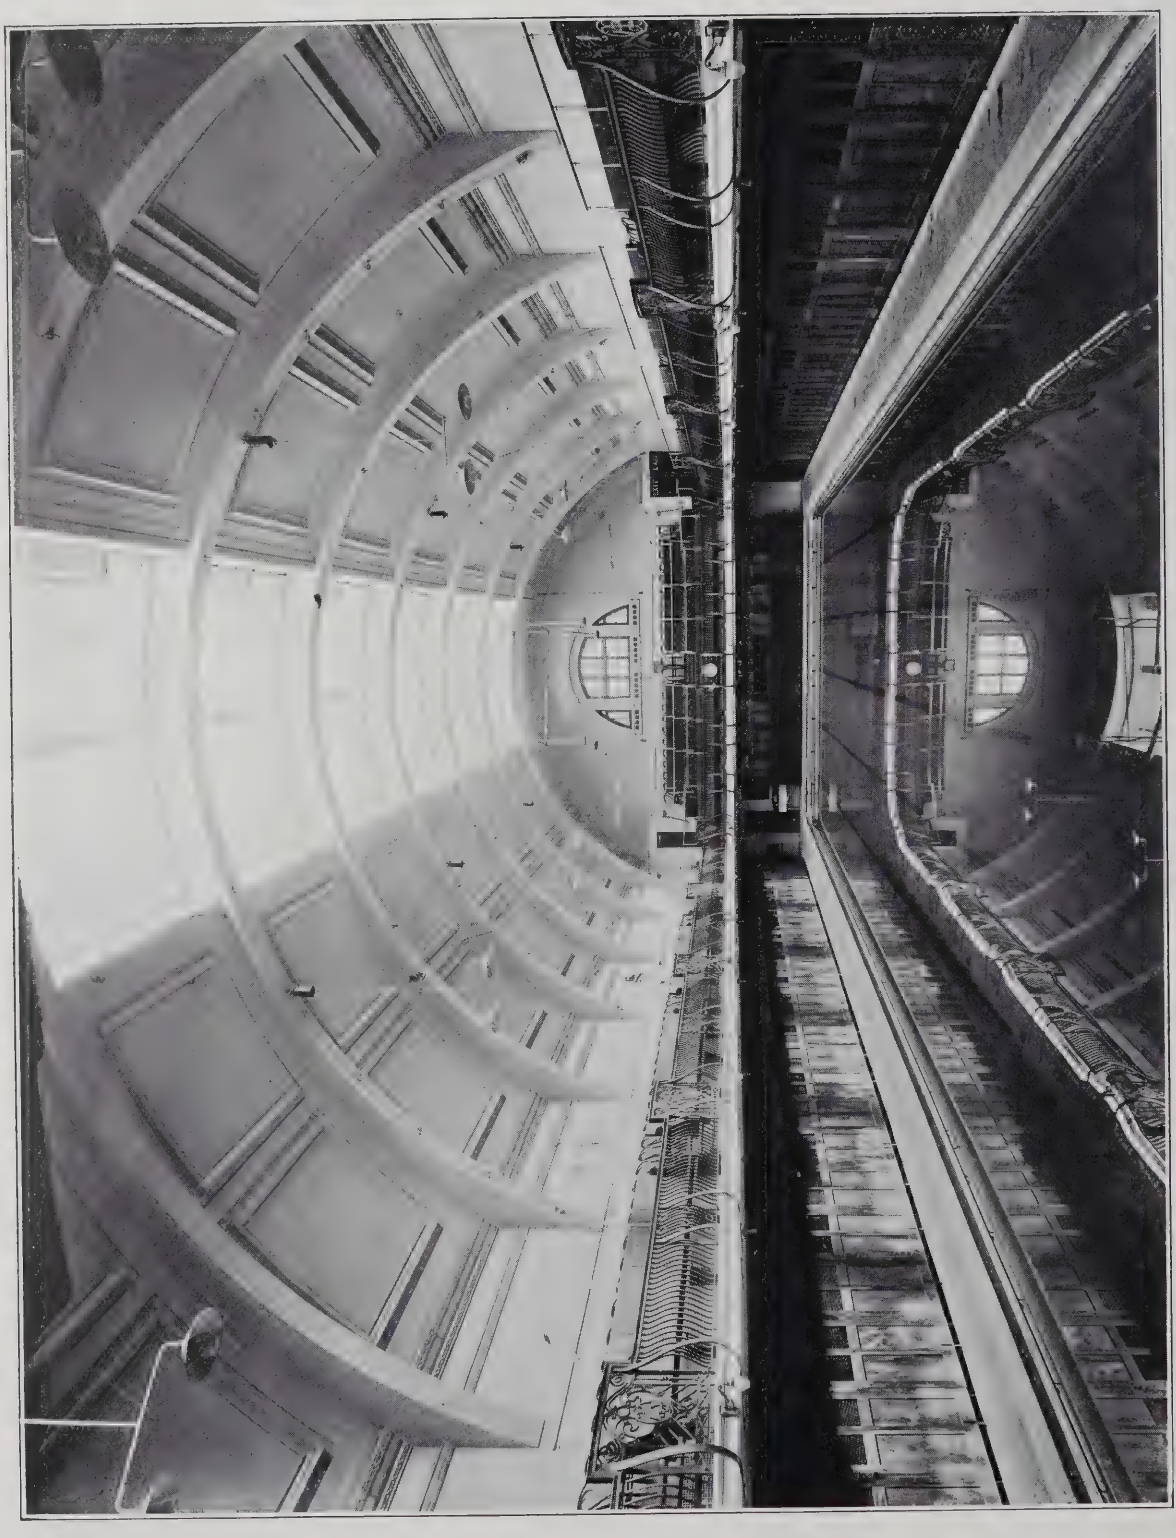
THE HAMMERSMITH PUBLIC BATHS: EXTERIOR. J. ERNEST FRANCK, A.R.I.B.A., ARCHITECT.

of reinforced concrete the stanchions or continuation of the main ribs were divided at the level of the roofs and corridors, were carried across them in an arched formation, were continued to the ground floor level on each side of the corridor, and joined again beneath the ground-floor, the lower portions of these stanchions thus becoming box-shaped. The architect considered that even if the roof trusses had been carried out in steel and covered with 2in. of some non-conducting external coating, such a structure would be less fire-resisting than ferro-concrete, and the ribs showing in the ceiling of this bath are true structurally. Moreover, steel roof trusses would have required periodical painting; but with reinforced concrete the necessity for maintenance hardly arises.

The frontages are faced with red brick with Portland stone dressings. The roof is covered with Precelly slating. The inner wall-faces of the swimming-bath, the public washhouse, and the establishment laundry, are of glazed brickwork, while the cornices, architraves, and dressings to the windows of the first-class bath are of Carrara Ware. The private baths, corridors, and other rooms are finished with dadoes in glazed bricks to various heights, the upper portions of the walls being finished in sirapite. The front portion of the entrance corridors in Lime Grove, and the entertainment entrance hall and corridor club-room No. 1, have dadoes carried out in plain coloured tiling from special designs by the architect. The gangways of the swimming baths are covered with non-slipping rubber tiles.

In the washhouses the sides and backs of the partitions to each stall are constructed for an exhaust vapour pipe to be carried the whole length of each range of stalls into extract ducts formed in the wall, the floor of the washhouse being formed to give a fall to this pipe for draining any condensation water. A separate connection is taken from each boiler into the main exhaust pipe, and by this means the washhouse is kept entirely free from steam.

The general contractors were Dearing and Sons, of Clarence Works, Halliford Street, N. The following are some of the sub-contractors: The Expanded Metal Co., Ltd., of Westminster, were the sub-contractors for the whole of the reinforced concrete construction, except the concrete foundation rafts under the chimney and other portions of the building, which rafts were reinforced with expanded steel, and constructed by the general contractors. The reinforced concrete work comprised the two swimming ponds, an elevated storage

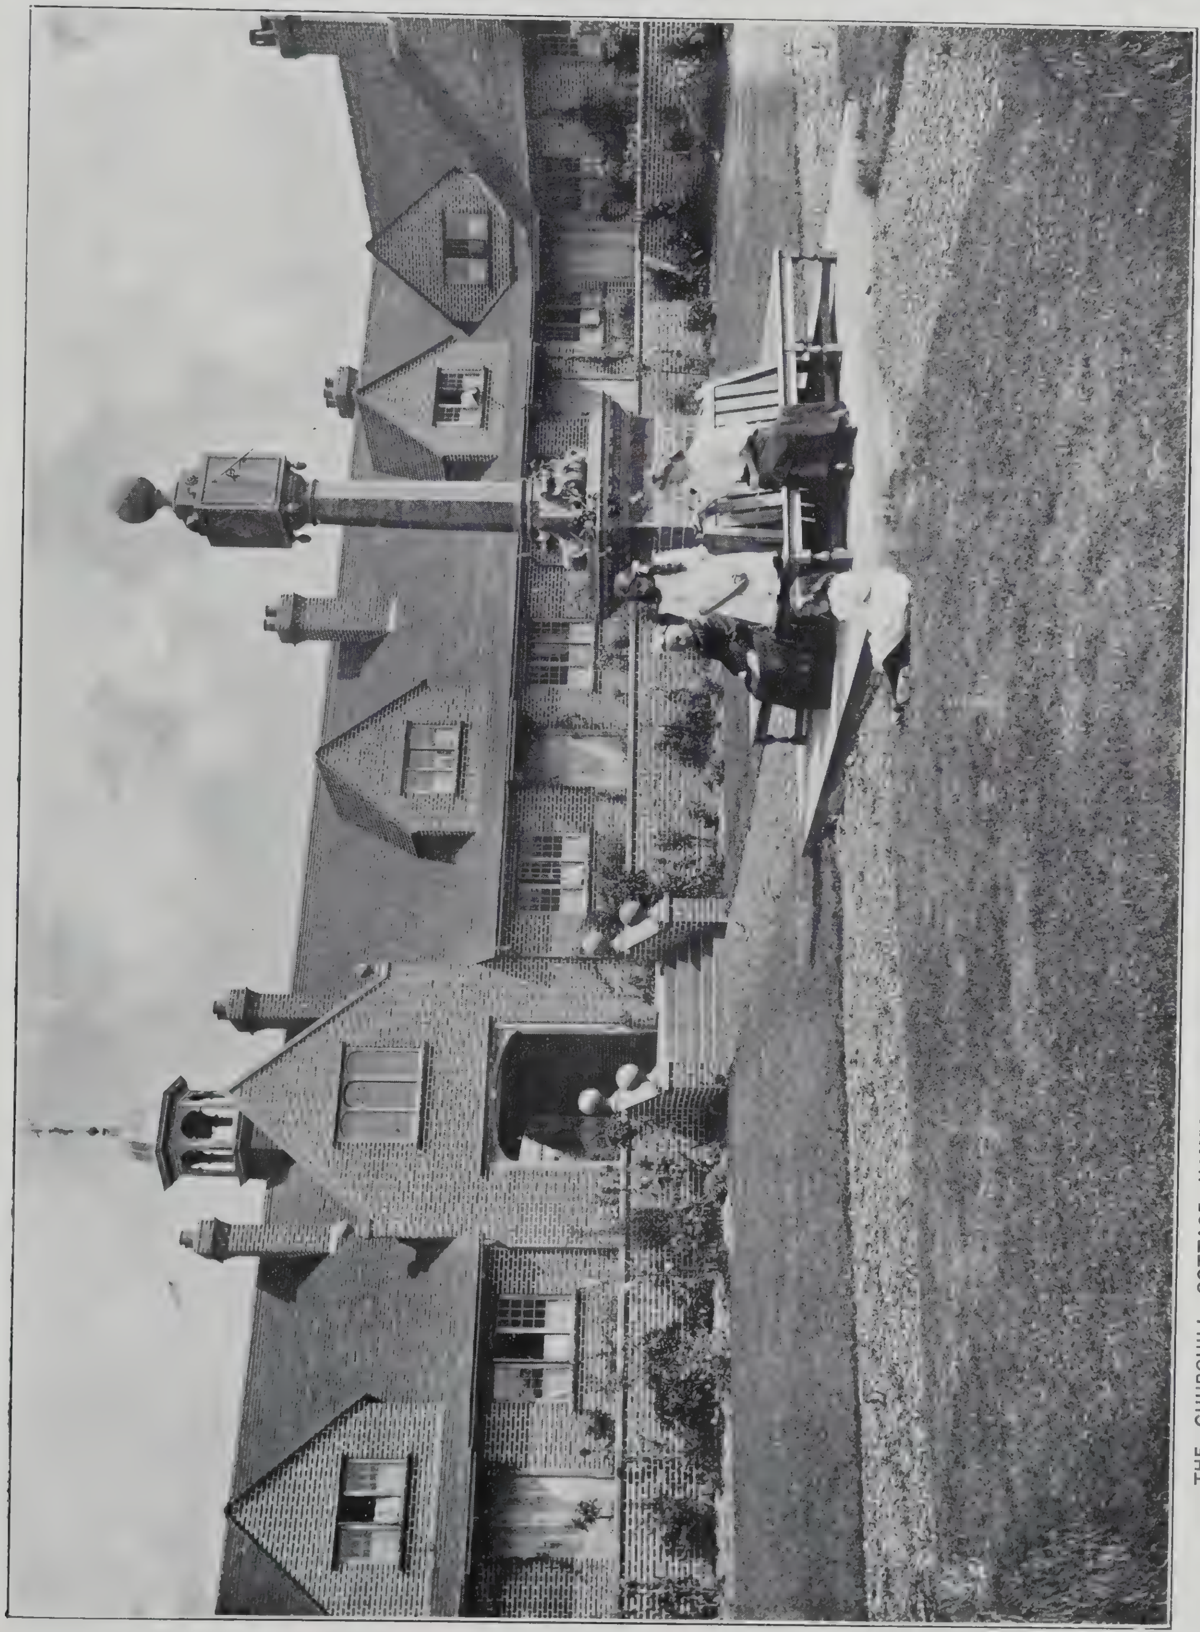


THE HAMMERSMITH PUBLIC BATHS: GENERAL VIEW OF THE LARGE SWIMMING POND. J. ERNEST FRANCK, A.R.I.B.A., ARCHITECT.

tank of 22,850 gallons capacity; nine arched roof principals (50ft. clear span), cantilever gallery round pond, and floors and flat roofs thoughout the building. The reinforcement throughout was expanded steel of various strengths, and Kahn trussed bars supplied by the Trussed Concrete Steel Co., of London. The "Ferrocrete" brand of Portland cement, supplied by the Associated Portland Cement Manufacturers, Ltd., was used throughout. "Mack" partitions, J. A. King and Co. The whole of the bath fittings were supplied by Doulton and Co., of Lambeth. Electric light fittings, F. and C. Osler, and Fittings, Ltd. Glazed bricks, lining to swimming ponds, and porcelain baths, The Farnley Iron Co.; T.L.B. facing bricks to front, T. Lawrence and Sons, Bracknell; tiling to entrance corridors, Craven Dunnill and Co.; tiling to bath gangways, Pilkington Tile and Pottery Co.; plasterwork to barrel ceiling over main baths, F. de Jong and Co., Camden Town; fire-grates and mantels, Bratt Colbran and Co.; lightning conductors, Joseph Lewis; drainage fittings, John Jones (Chelsea), Ltd.; the whole of the general engineering scheme, and the fittings to the public washhouse, laundry, etc., J. and D Tullis, Ltd.; wrought ironwork gates and railings, and brass foundry work Lockerbie & Wilkinson

THE CHURCHILL COTTAGE HOMES. Silcock and Reay, Architects.

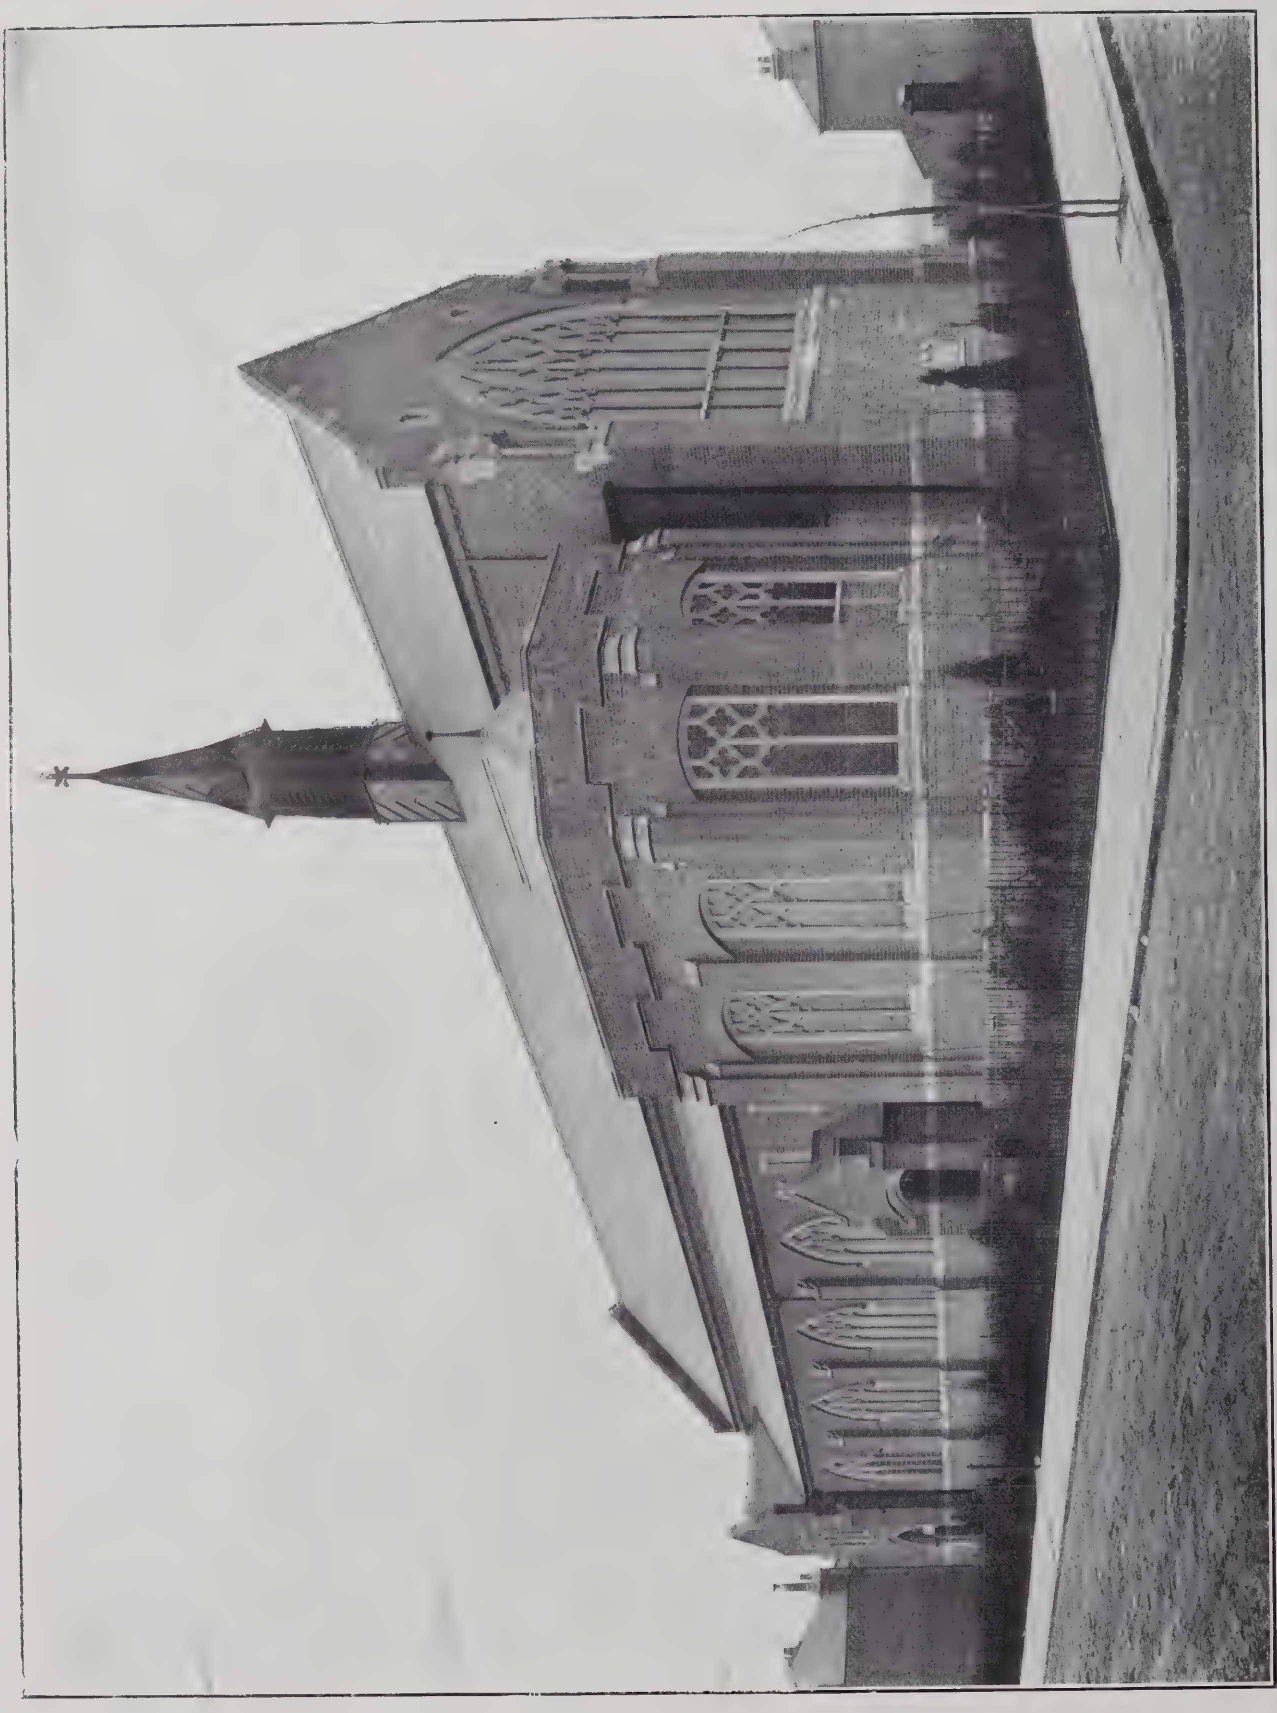
The Churchill Cottage Homes were built in the Cheddar Valley, Somerset, by the late Mr. Sidney Hill, J.P., whose object was to provide twelve comfortable homes for the deserving poor. In addition to a completely furnished house, each occupant of these homes is given a sufficient weekly sum for maintenance, a perpetual income of £400 a year being set aside for this pur-



THE CHURCHILL COTTAGE HOMES: GENERAL VIEW FROM THE QUADRANGLE. SILCOCK AND REAY, FF.R.I.B.A., ARCHITECTS.

pose under the endowment scheme administered by trustees. The houses, which stand upon freehold land containing one and a half acres with a field upon the south having an area of four acres belonging to the trust, and reserved for ever as an open space, are arranged on three sides of a quadrangle about one hundred and twenty feet square. The third or the south side is enclosed by a low brick terrace wall coped with stone and ornamented with carved stone vases, and in the centre is a gateway with fine wrought-iron gates giving access to the working gardens with which each occupant is provided. Wide stone-paved walks run round the four sides of the quadrangle, the south walk being terminated at each end with a large arbour arranged under the main roof, which is supported by oak posts and balustrades, each arbour containing suitably designed oak seats and tables. The quadrangle has low brick parapet walls running entirely round it, with stone steps leading down to the lawn and flower borders; these are sunk some two feet six inches below the level of the stone-paved walks, and in the centre is a large stone sundial with decorative features in lead, and having a spreading base of brick, around which is an oak seat.

Flower borders are arranged upon each side of the walks in the quadrangle, and



ST. PAUL'S CHURCH, WEST EALING: VIEW FROM THE SOUTH-EAST. HALL-JONES AND CUMMINGS, ARCHITECTS.

(See page 652.)

many beautiful rose trees and creepers have been planted against the houses and arbours.

The quadrangle faces south and commands a most beautiful view of the Mendip Hills, which at this point are well wooded.

The north side is separated from the road by a forecourt 200ft. long and 50ft. deep, and about five feet above the road level, having lawns and walks with flower borders and trees, and adjoining the road is a terrace wall of brick with large stone vases and rich entrance gates of wrought iron approached by a flight of steps from the road.

The north, east, and west sides of the houses are symmetrically designed with gables and recessed arbours having oak posts and arches. The doorways throughout are constructed of oak frames and arches with oak doors, those in the quadrangle having moulded hoods supported by richly carved corbels.

The walls are of sand-faced brick, with hand-made red tile roofs, the window frames being of oak, with iron casements and lead-light glazing. The stone, which is sparingly used, is from the Guiting Quarries, and its rich yellow tint harmonises well with the warm tones of the walls and roofs.

Each house has upon the ground floor a living-room and bedroom with a small scullery, larder, etc., and upstairs is another bedroom and a large storeroom. The houses are self-contained and free from the usual excrescences at the back; there are, in fact, no backs at all as generally understood, all the elevations being equally important.

Over the principal entrance to the quadrangle is a large room for the use of the trustees, reached by a spiral stone staircase. This room is panelled to a height of seven feet, and has a stone fireplace and windows at each end, on which are the coat of arms of the founder.

The "Worker" grates adopted for the living-rooms are set in golden brown bricks with raised hearths of the same material. The bedroom grates have green tile surrounds and tiled hearths, and all the fireplaces have simple oak mantels. A guard fender is provided for each living-room, and bells enable each house to communicate with the others in case of emergency.

All the houses are completely furnished with substantial oak furniture designed by the architects in harmony with the general style of the homes.

In carrying out the work every endeavour has been made to obtain and preserve throughout the old-world character and quiet charm attaching to the many fine old groups of houses of this kind scattered throughout the country, and with this end in view no detail, however unimportant in itself, has been deemed unworthy of attention.

In the north-west corner of the site and adjoining the road a matron's cottage has been built containing two sitting-rooms, a kitchen, three bedrooms, and a bath-room, and in the south-west corner a small but fully-equipped laundry has been provided and built, together with other necessary outbuildings.

The actual cost of the buildings, exclusive of the cost of land and expenses in connection with their erection, amounted to £11,000, and the furniture in the homes, the trustees' room, the matron's cottage, etc., amounted to a further sum of £1,915. The gardens and planting cost about £900 more.

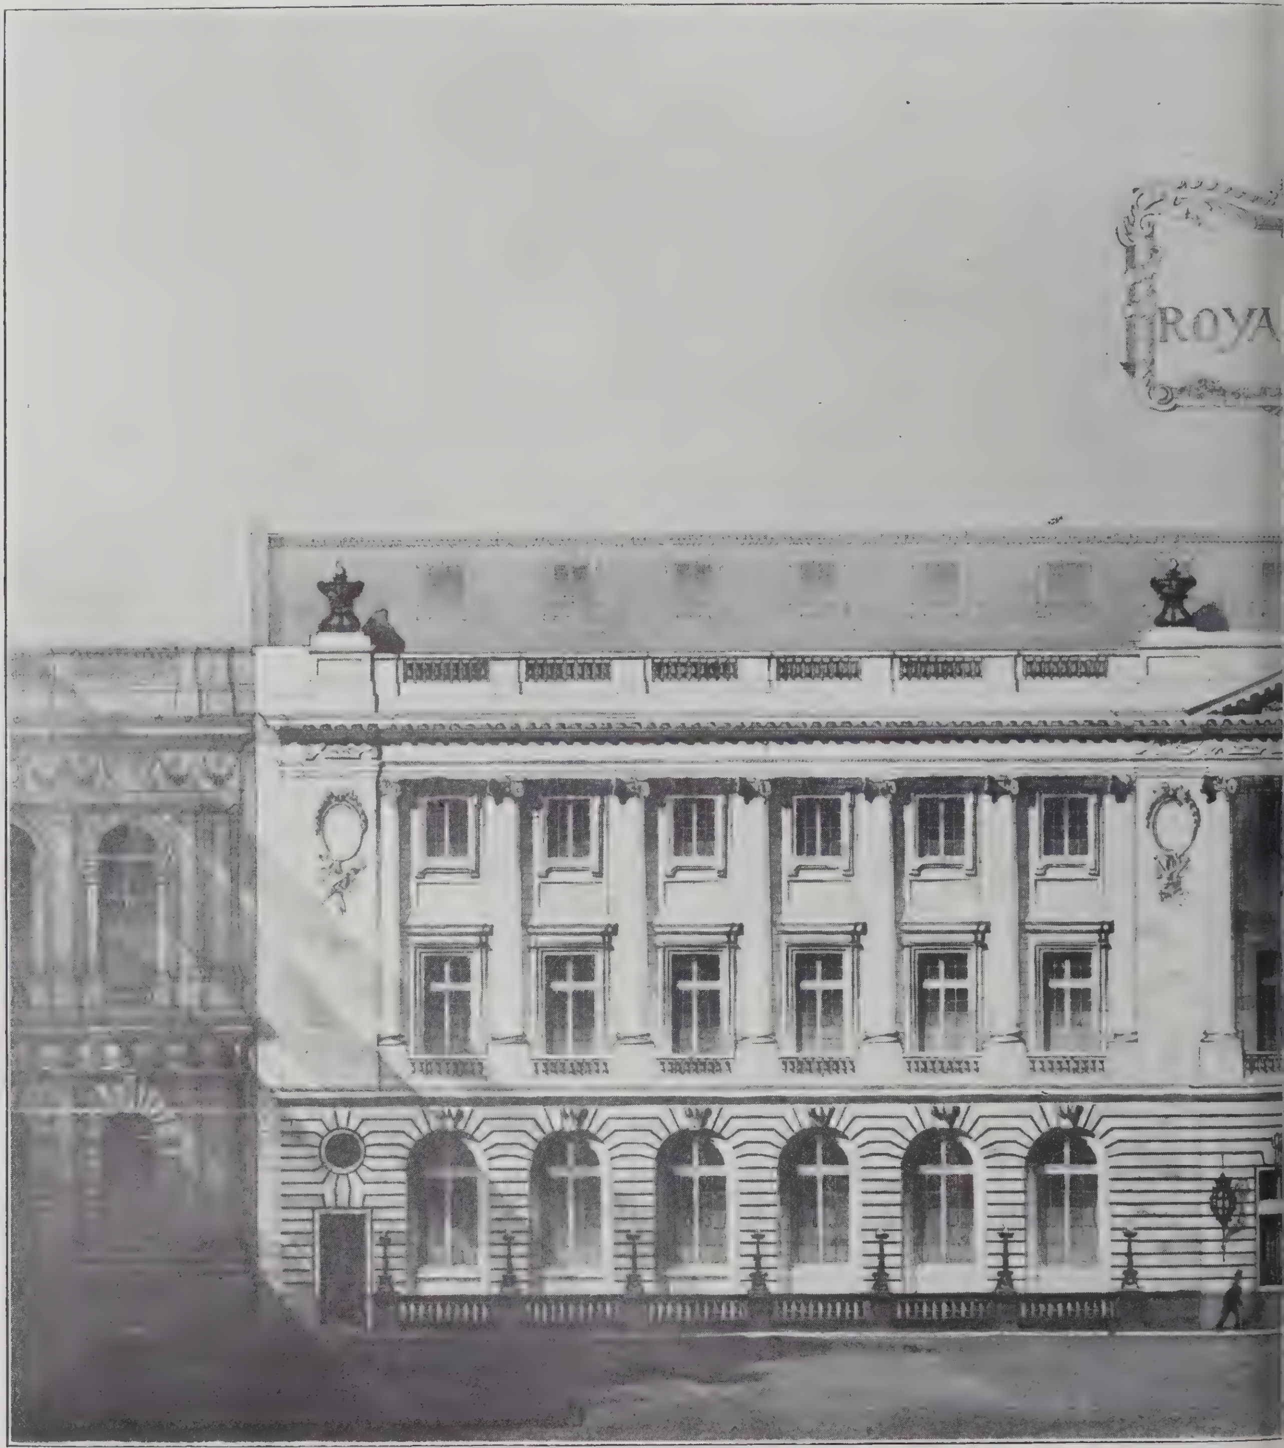
ROYAL AUTOMOBILE CLUB, PALL MALL: PLANS. MEWES AND DAVIS AND E. KEYNES PURCHASE, ARCHITECTS.

(For View, see overleaf.)

CHURCH OF ST. PAUL, WEST EALING.

This church has recently been erected in the south-west district of Ealing. Having regard to the desired economy in outlay, it was essential that the design should be of simple character; but this is relieved by the tracery of the windows and, there being no clerestory, the aisles are unusually lofty and give a dignified effect to the interior. The church is faced externally with yellow bricks and Bath stone dressings, and finished internally with similar stone and grey sirapite plaster. The walls of aisles and chapel are panelled to a height of 12ft. and distempered an olive-green colour, the east wall of chancel being treated more



THE FACADE AT PALL MALL. MEWES AND

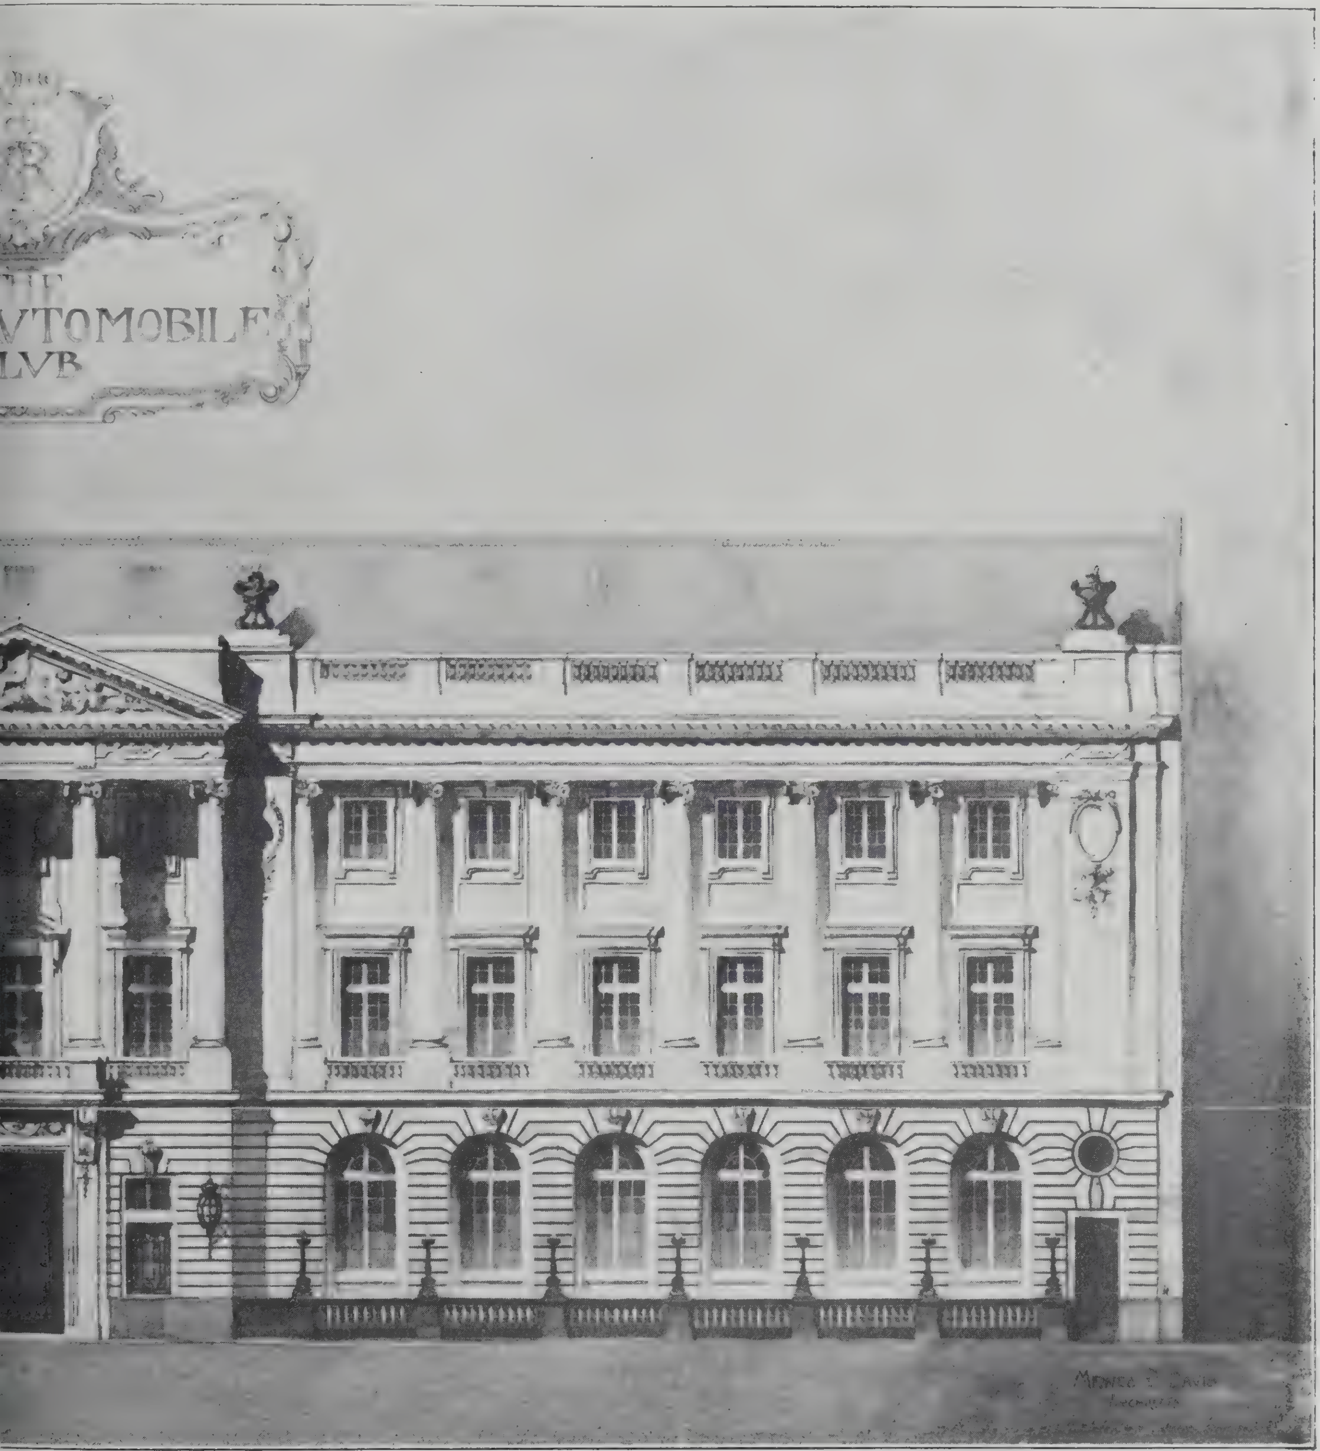
ROYAL AUTOMOBILE CLUB, PALL MALL.

A notable exmple of the French influence that will soon be found in Pall Mall, on a part of the site occupied by the old buildings—formerly the War Offices—between the Carlton Club and St. James's Palace grounds, in the new home of the Royal Automobile Club.

Pall Mall (though it exhibits a few aberrations) has been more fortunate than most of London's principal streets, in so far as the newer buildings have been for the most part at least the equals in design of the older structures which they have superseded. English sentiment breeds reverence for anything that is old, regardless of whether or not the object be intrinsically worthy of it; which, as far as architecture is concerned, may be understood when one looks upon the good, if commonplace, old structures, and then upon the pretentious so-called “improvements”; one

Hall-Jones and Cummings, Architects. (*Illustrated on page* 650.)

elaborately. The pulpit, reading desk, and choir stalls are of oak, and the remainder of joinery pitch pine. The church is heated by steam radiators, and fresh-air inlet ventilators are arranged in conjunction with these, the foul air being extracted by means of a fan in the flèche. The seating accommodation of the church is 800, and the total cost works out at about 9,000. The builders were T. H. Kingerlee and Sons, of Oxford, the glass was executed by W. Smith, of Balcombe Street, heating and ventilation by Russell and Co., of Lancashire Court, New Bond Street.



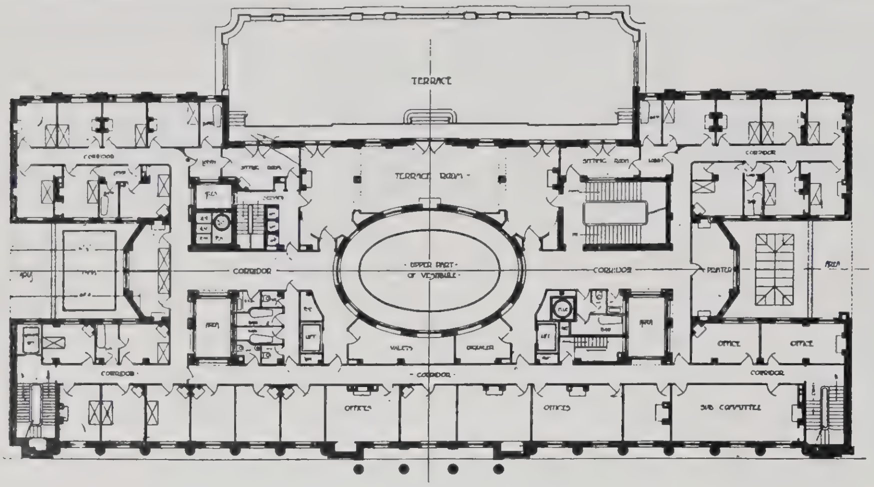
E. KEYNES PURCHASE ARCHITECTS.

Mewès and Davis and E. Keynes Purchase, Architects.

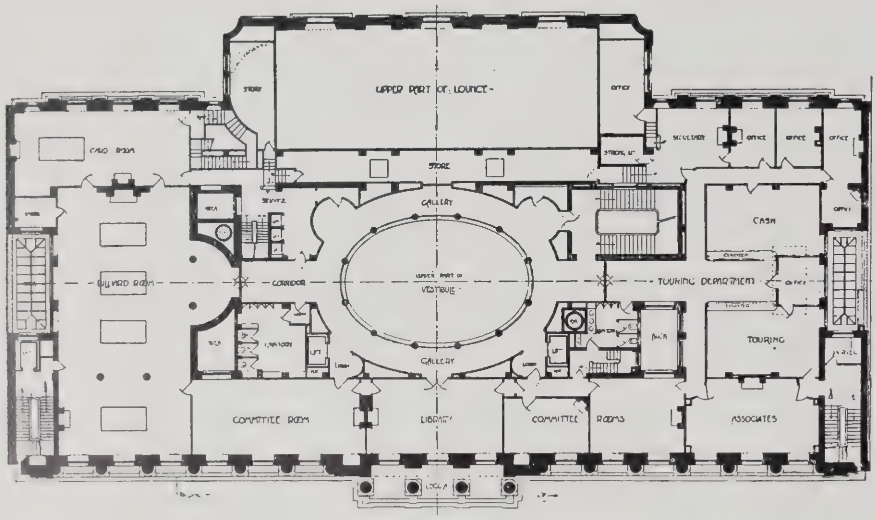
grasps in an instant the national antipathy to "improvements," sympathises with it, and gives the protesting public credit for at least good judgment.

The old War Offices were just such commonplace old buildings, with nothing remarkable about them—only plain—not particularly refined, just inoffensive, and the improvement will be a real one. The Royal Automobile Club is being built from the designs of Messrs. Mewès and Davis, with whom is associated Mr. E. Keynes Purchase, the honorary architect of the club.

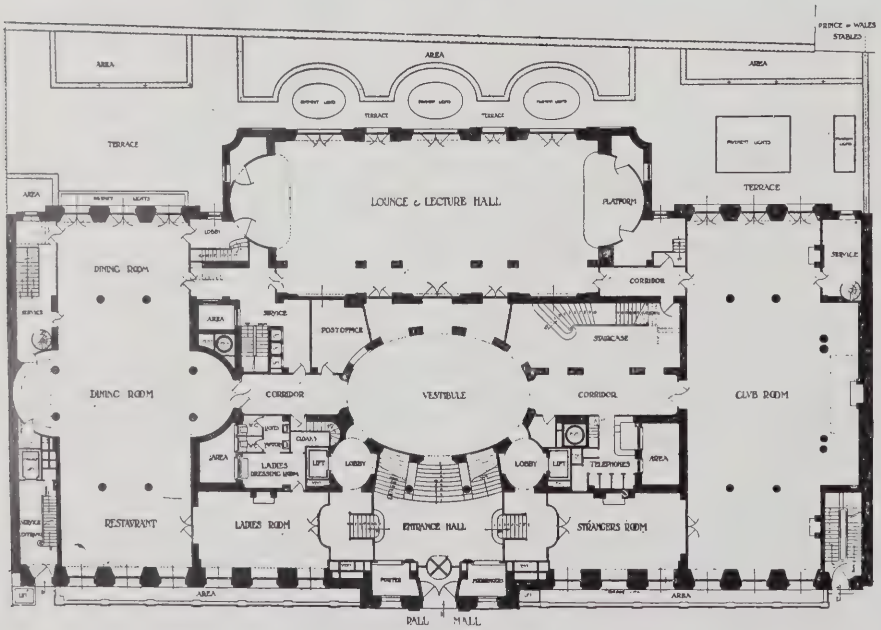
Few modern buildings afford such opportunities for the display of an architect's abilities as does a club-house, for which there are many obvious reasons. There is, for instance, no opposition party demanding an investigation of every penny spent upon those details and



Second Floor Plan.



First Floor Plan.



Ground Floor Plan.

ROYAL AUTOMOBILE CLUB, PALL MALL. MEWÈS AND DAVIS AND E. KEYNES PURCHASE, ARCHITECTS.

materials which come beyond the range of "rigid economy," usually the bane of the architect's existence when he is working upon the plans of a building that is to be erected from funds gathered by the tax collector. Neither is there the trouble of educating the client from "Victorian Gothic" to serenity, nor the diplomatic labour necessary to convince his clients' lady relations that his design cannot be materially improved upon —and cheapened at the same time—by adopting all the suggestions set forth in the architectural (?) section of some newspaper for ladies, which are sometimes brought to bear against his ideas as to domestic work. Perhaps most fortunate of all is the fact that this is in no sense a commercial structure. An important social club—especially an Automobile Club—implies a certain assumption of the wealth of its members, but differs from an expensive hotel, in that its object is not primarily to make money; and therefore it need not vie with its neighbours in pretensions to luxuriousness for the sake of the advertisement entailed. Moreover, the members of its committee may be expected to possess a degree of taste and judgment that is perhaps hardly so likely to be found in those charged with the erection of public or ecclesiastical or commercial structures. A club committee are less likely, also, to leave the architect without information as to what is required, or to goad and hamper him with unreasonable conditions and absurd restrictions. A member of such a committee could never be selected from the ranks of resolute busy-bodies, even if by some strange mischance such a pest had been admitted to membership. Hence obstructive interference or aggressive individuality is improbable of intrusion upon the domain of the architect, and he is left to solve his problem under almost ideal conditions. He is given the site, and the approximate number and kind of rooms for reception and entertainment, for accommodation of members, and for service. The engineering detail, if more complex, may be less in evidence than is usually necessary in other large buildings. Participating at once in the nature of the domestic and public building the high-class club is the least of each and the highest type of both—the home of good form and refinement. Strongly marked or eccentric personality, if not discountenanced, is genially tolerated; but extraordinary originality, especially if it leans to eccentricity, is *not* clubbable. It follows that the character of the architecture of a club must be dignified, the style correct, and the individual element in design which makes a home charming to one person and unbearable to another must be eliminated from consideration.

It is for these reasons that impersonal, if not strictly monumental, architecture has been the rule for the best clubs of the West End, high Renaissance being the type of design which has prevailed in Pall Mall. Of the clubs extending from Waterloo Place to St. James's Palace (which includes the Athenæum, Travellers', Reform, Army and Navy, and Carlton), the façade of the Travellers' is based upon the design of the Pandolfini Palace in Florence, and that of the Carlton upon the Library at Venice, and the Reform and Army and Navy upon places at Rome and Venice.

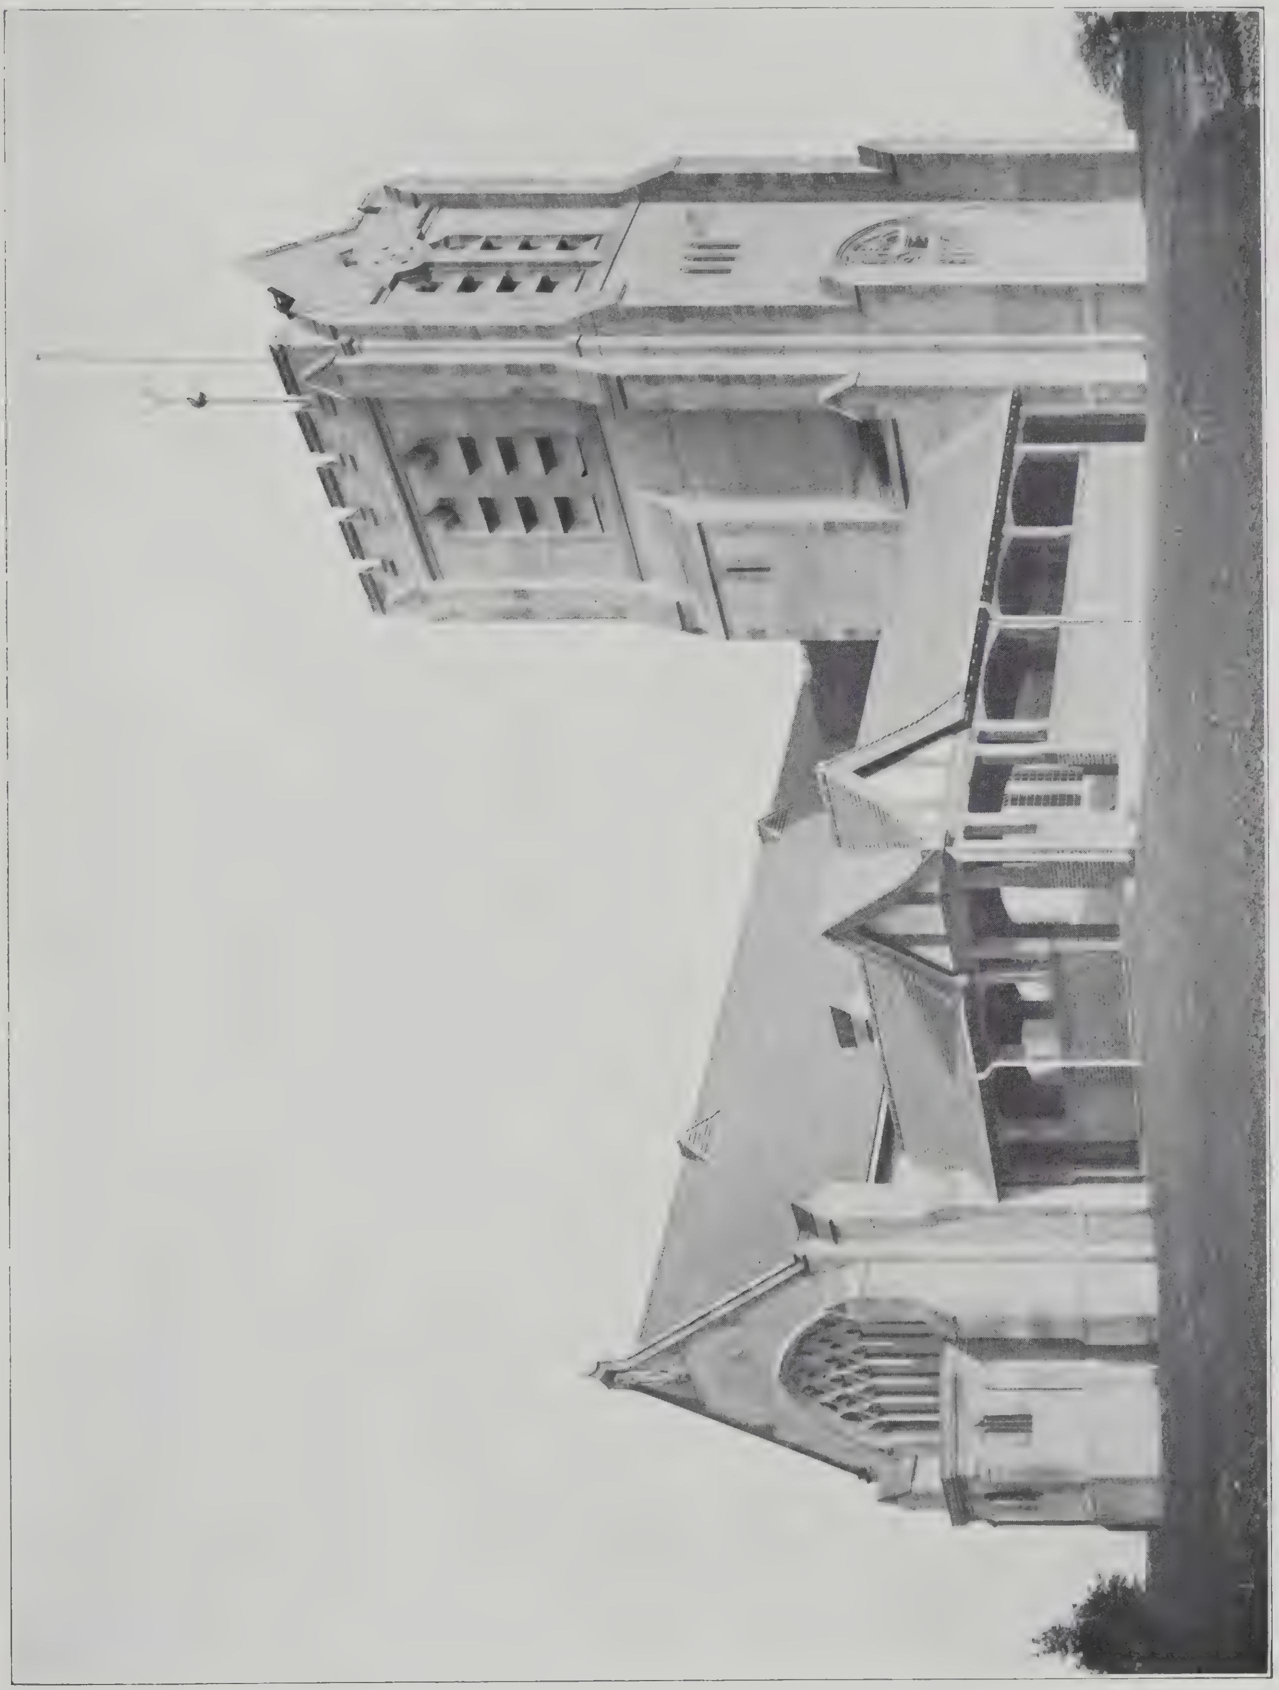
The Royal Automobile Club, which will adjoin the Carlton, follows the precedent more or less adopted by the other clubs, and owes its inspiration to the former Hotel Crillon-Coislin—now the Automobile Club—in the Place de la Concorde, Paris. It would be difficult to find a more beautifully studied example of modern architecture than the fine fronts by Gabriel facing the Place de la Concorde—there are two buildings, exactly alike, the former Hotel Crillon-Coislin and the Ministère de la Marine—second only to Perrault's colonnade of the Louvre.

The general contractors are Messrs. Waring and White, Limited. Messrs. J. A. King and Co. are supplying a large quantity of their King fireproof pumice concrete partitions, and their Mack slabs for use in forming air-ducts, as well as concrete blocks for encasing beams. The Leeds Fireclay Co. have supplied white Impervit glazed bricks and tiles.

DODFORD CHURCH, WORCESTERSHIRE. Arthur Bartlett, Architect.

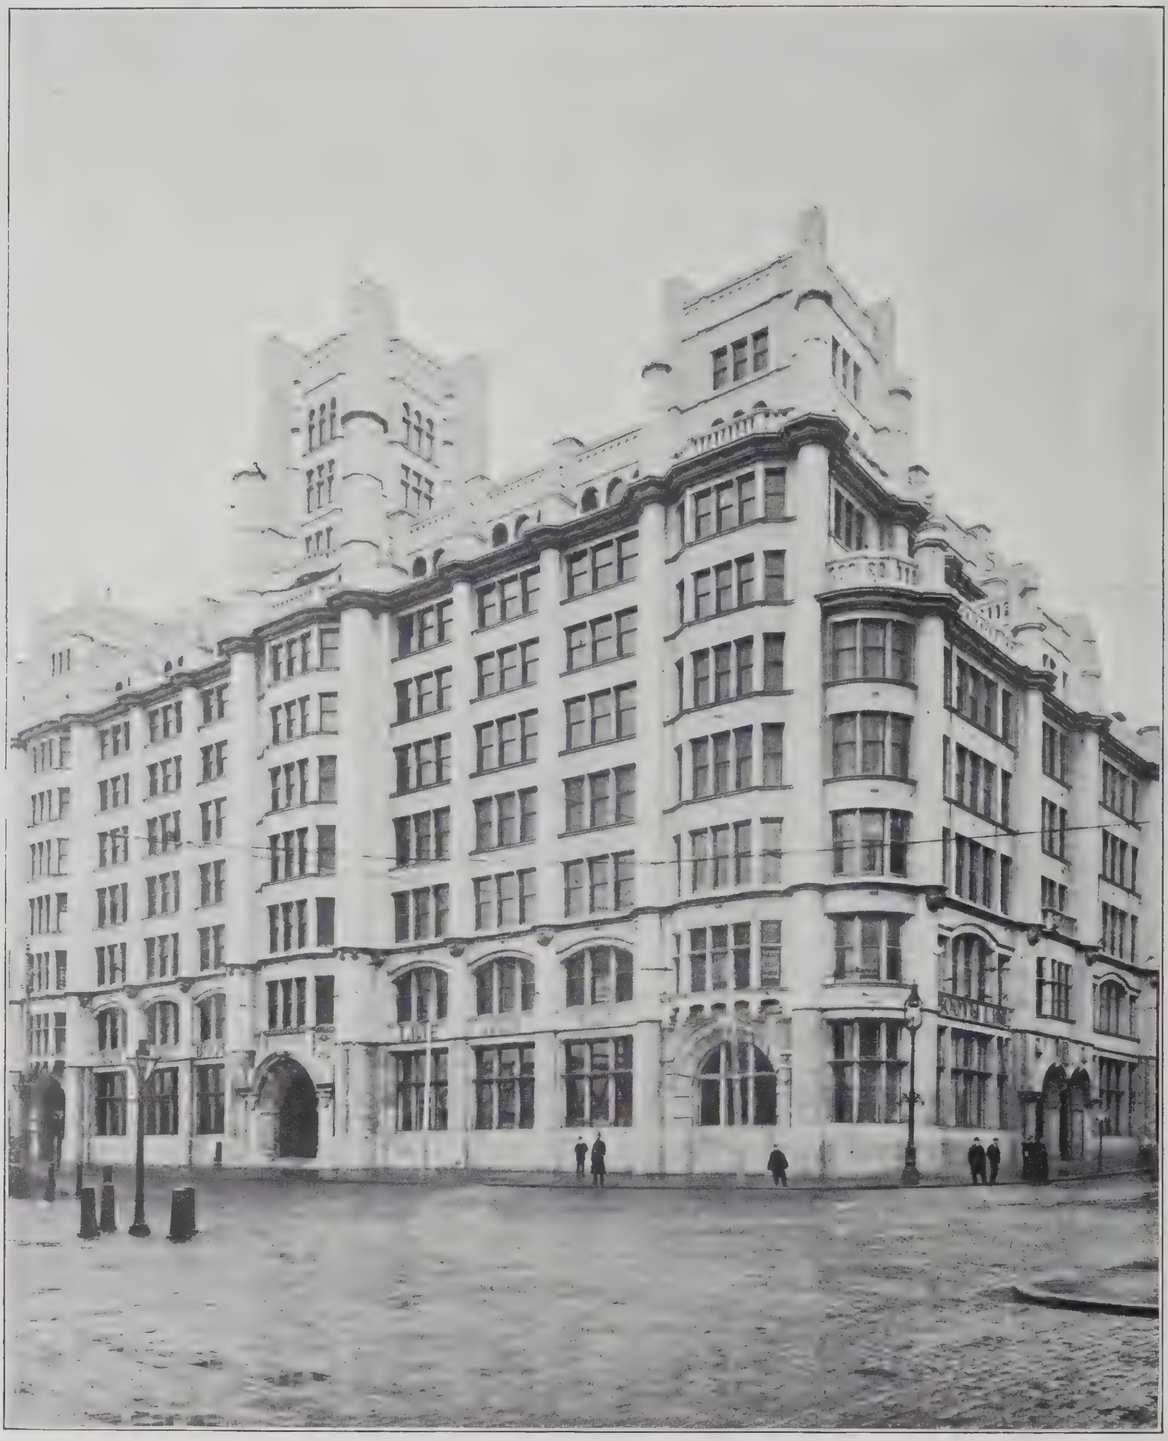
This building has been erected on the western slope of a hill between Kidderminster and Bromsgrove, looking out on to the Malvern Hills. The new parish of Dodford was carved out of the mother parish of Bromsgrove, the living endowed and the new church buildings erected through the munificence of the Rev. W. G. Whinfield, a former curate of Bromsgrove. The cloisters shown in the photograph surround a paved court, with an open-air pulpit reached from the tower staircase. It is intended to have open-air services for children and others during the summer months in this cloister court. The structure is built of local bricks, covered with cement rough-cast, and with local stone dressings.

Inside the church massive stone arches span the nave and take the place of roof principals, and in the soffits of the arches are modelled plaster panels with representations of the produce of the district—most of the parishioners get their living by market gardening. The cross shown on the rood-beam, made of metals and enamels, is the work and gift of Miss Amy Walford, a pupil of Professor Herkomer. The beam itself is made of silver harewood, with emblems of gilded lime tree, and is the work of Messrs. Martyn, of Cheltenham. Mr. Charles Beacon, sculptor, modelled the Madonna and children on the



DODFORD CHURCH, WORCESTERSHIRE: VIEW FROM THE SOUTH-WEST.

gable over the cloister entrance. The general contractors were J. and A. Brazier. The modelled plasterwork was executed by the Bromsgrove Guild; the stained glass and leaded lights by A. J. Davis. Messrs. Wooland, of Hereford, executed the acetylene gas lighting; Messrs. Ward, Worcester, the heating; and Messrs. Nicholson, Worcester, supplied the organ.



THE TOWER BUILDING, LIVERPOOL. W. AUBREY THOMAS, ARCHITECT.

THE TOWER BUILDING, LIVERPOOL. W. Aubrey Thomas, Architect.

The Tower Building is one of the largest office blocks in Liverpool, the total area of the office accommodation being 11,800 square yards. The name is derived from the fact that the site was formerly occupied by a castellated structure which in bygone times was the fortress of the Earls of Derby. The elevation to the ground-floor storey is of granite, and for the remainder of the height "Carrara" has been used. The main building rises in eight storeys to a height of 115ft., in the towers at the angles in nine storeys to 130ft., and in the main tower in eleven storeys to 153ft. above the ground-level. There are three public entrances, one in each of the three principal frontages. The planning is simple and direct, abundance of light being provided. Access to the various floors is from three main staircases, and from four electric elevators.

The general contractors are Messrs. W. Thornton and Son, Liverpool. The fire-resisting floors, stair-cases, and roofs have been constructed by the Kleine Patent Fire-resisting Flooring Syndicate, Ltd., High Holborn, London. The "Carrara" façades were executed by Messrs. Doulton and Co., of the Royal Doulton Potteries, Lambeth, who have also supplied the sanitary fittings. The extensive plastering work, plain and decorative (with some fine ceilings in fibrous plaster), the reinforced fireproof walls on the indented bar system, and the fireproof partitions, were executed by Messrs. Henry Johnson and Sons, Primrose Hill, Fontenoy Street, Liverpool. Messrs. Dargue, Griffiths, and Co., Liverpool, carried out the electric lighting of the Booth Line offices, which occupy the whole of the ground floor, and installed their D.G. Centralised System of forced circulation hot-water heating apparatus. Five electric passenger lifts have been fitted by the Easton Lift Co., Ltd., of Broad Sanctuary Chambers, Westminster, and the chief provincial cities.

ENGINEERING WORKSHOPS, SILVERTOWN.

This building, which was completed at the end of January, is erected on the Frazzi system. Its length is 214ft., width 45ft., including the annexe, with an average height of 34ft. The whole is carried on a reinforced concrete raft especially designed for bearing loads put on by a 10-ton crane. The floor of the building also carries a number of heavy machines. The building is steel framed, the stancheons being of the necessary dimensions to carry the travelling crane above mentioned. The walls are formed of 3-in. Frazzi slabs jointed in cement, and left bare both inside and out, showing the pink terra cotta colour of the material.

The slabs are 2ft. long and 10ins. wide, with hollows throughout the length, the thickness of the terra cotta material not exceeding ⅜in. in any part. The whole of the steel work externally is covered with casings of Frazzi material, so that none of it is exposed, with the exception of the down pipes to the gutters. The roof is of the saw tooth type, the south slopes being also covered with Frazzi special roofing slabs, 1½in. thick, in 3ft. lengths. The slabs are carried on T iron rafters spaced 3ft. centres, and are covered externally with Major's double Roman tiles. The gutters are formed of asphalt bedded on Frazzi slabs. The roof of the annexe is flat, and is formed of Frazzi floor slabs, 3ins. thick, 3ft. 4ins. long, carried on rolled steel joists, the exterior being covered with asphalte laid direct on to the Frazzi material. A concrete raft is laid over the floor of the whole building, that portion which forms the floor of the annexe being supported by piles, while the floor of the main building is constructed with sufficient strength to dispense with piles entirely. The laying of the concrete, which is formed of broken brick, sand, and Portland cement, was done in one operation, without any cessation whatever, so that no setting had occurred at any point before the next portion was thrown in. The whole is therefore one continuous mass, without joints.

The cost of this building complete, including the wood block floors, the piles under the annexe, the concrete raft, the whole of the steel work, also the walling and roofing, tiles, sashes, glazing, asphalt doors, gutters, tanks, etc., amounted to the sum of between £4,500 and £5,000, which, considering the exceptional strength required in the building to support the machines and the 10-ton crane, may be considered a very low figure, amounting to not much more than 3½d. per ft. cube.

It is interesting to note that the building has remained perfectly sound and water tight throughout the year, and that no movement of the raft has taken place, in spite of the heavy loads and the vibration to which the whole building has been subjected.

The steel work was, of course, erected by the owners, Messrs. Richard Moreland and Sons, and the Frazzi Fireproof Construction Co., Ltd., carried out the whole of the concreting and building work, other sub-contractors executing the glazing, asphalt, and wood floor.

ENGINEERING WORKSHOPS, SILVERTOWN, LONDON, E. (Frazzi Construction.)

CONCRETE AND STEEL IN 1909.

During the past year the use of concrete for many and various purposes showed no diminution, and a steady growth of reinforced concrete as a method of building construction was everywhere noticeable, it having taken its place in ordinary building practice, although it is now only a few years since it was practically unknown in this country. Although the use of steel has been more extensive in the past year perhaps than in any previous year, we are becoming so used to reinforced concrete construction that we do not so easily perceive an advance. A few examples at one time attracted much attention, but so many buildings have been erected in the past year (though fewer, perhaps, than in the previous year), and there are consequently few outstanding features that can be singled out in a review of this character. The progress, however, that has been made in connection with the use of concrete for all purposes has resulted in the formation of a special society for the discussion and general enquiry into all aspects.

The Concrete Institute.

The inception of the Concrete Institute was chronicled in our review last year, but the Society was then merely in its beginnings, for the first meeting of the council took place only on July 21st, 1908. At the end of that same year it had about 450 members. In the past year the membership has been about doubled. This is not the only respect in which the Concrete Institute may be said to have had a very prosperous year. Its meetings have been very successful in the production of many interesting papers and discussions.

The objects of the Institute are: To advance the knowledge of concrete and reinforced concrete; to provide a means of communication between persons interested in the subject, and to hold meetings for the discussion of practical and scientific matters bearing on the general application of the materials, and these objects are being well served. There is no doubt, for instance, that the Institute has done something to advance the knowledge of concrete and reinforced concrete; and altogether it seems to have fairly started upon the useful career that was anticipated for it.

Standing committees have been formed for science, Parliament, reinforced concrete practice, plain concrete, and tests, and that these committees, each with its chairman and secretary, are doing good service, may be inferred from a single instance. The London County Council General Powers Bill (1909) for the amendment of the London Building Acts, contained clauses governing the erection of steel-frame buildings and reinforced concrete structures. The original draft was opposed by the Concrete Institute, the Royal Institute of British Architects, and other professional bodies, and a delegate from the Concrete Institute was examined in committee, and as a result of the Institute's action various alterations were made which improve the Bill, from the point of view of those specially concerned and the professional public. Moreover, the name of the Concrete Institute was included among those societies who had to be consulted before any regulations were brought into force by the London County Council. In this way official recognition has been given to the Concrete Institute by Act of Parliament.

Standard Calculations.

This is only one line of the activity of the Parliamentary Standing Committee. The Science Committee of the Concrete Institute, on the other hand, has been chiefly concerned with the drafting of standard algebraic calculations and notations for reinforced concrete. The Institute moved in this matter at quite an early stage, before it was approached by the International Commission on Reinforced Concrete to pass its opinion on the point of a suggested uniform notation. The view of the Concrete Institute was, that it was inadvisable to have an International notation, as the symbols should be an abbreviation of the initial letters of the words describing certain mathematical quantities, and the Continental terms not being quite similar to those of English-speaking countries, it was held that, though a notation might usefully be devised for Continental use, a separate notation would be better for England and America. The Science Committee considered the matter in detail, and drew up a standard list of symbols, which were submitted to the International Commission on Reinforced Concrete at its meeting at Copenhagen in May of the past year, and the American Institutions are now being approached with a view to this notation receiving the stamp of official approval in America as well as in England. Considering the amount of literature on the growth of a proper theoretical knowledge of reinforced concrete, the work which the Concrete Institute has undertaken in this respect must become of increasing value to both the student and the practitioner.

Practical Investigations.

Sub-committees of the Science Standing Committee were formed to deal with the question of the rusting of steel in concrete, and with the present practice in respect to the bearing power of reinforced concrete piles. These sub-committees are collecting a good deal of valuable data. The Reinforced Concrete Practice Committee has appointed sub-committees to deal (1) with a practical preventive measure against the expansion and contraction of reinforced concrete floors; (2) a simple specification for foremen, etc., as to the dampness of concrete mixtures for plain concrete and reinforced concrete; and (3) practical methods of fixing these materials. These are all subjects of immediate and general importance. The Parliamentary Committee is also considering the means to get local Bills amended to enable the use of reinforced concrete without the present serious restrictions.

Valuable Papers.

In February last a valuable paper on the commercial aspect of reinforced concrete was read by Mr. Lucine Seraillier; and in March Mr. E. P. Wells delivered a paper on concrete in arched bridge construction. In May a paper was read by Mr. H. K. G. Bamber on the setting of Portland cement as a means of preventing expansion.

Visits.

In the summer, visits were paid to the works of the Associated Portland Cement Manufacturers, Ltd., at Swanscombe; to the reinforced concrete building of the General Post Office extension; and to the Western District Post Office, both of which are situated in London, and have been erected under H.M. Office of Works. In November, the winter session of the Concrete Institute again began with a general meeting, when a lecture was delivered by Mr. Richard L. Humphrey, dealing with the general application of reinforced concrete in the United States.

Science of Design.

The Institution of Civil Engineers has felt the necessity of doing something to place the science of reinforced concrete design on a surer footing, and though the R.I.B.A. Joint Committee of Engineers and Architects, which published a most valuable report on the subject some time ago did the pioneer work, and comprised members who have made a special study of the subject, yet we find only one member, Prof. Unwin, upon the Committee of the Institution of Civil Engineers. The body, as appointed, will no doubt add its quota to the growing volume of responsible professional opinion that reinforced concrete represents a most valuable advance in constructive methods, and one which offers economy, durability, and many other advantages.

The American Society of Engineers, late in the day, proposed also to appoint a similar committee to investigate the subject, and though it consisted of a number of engineers not specially noted as having specialised in reinforced concrete, its report published last year confirmed practically the whole of the opinion of the Royal Institute of British Architects' Committee, and helped to convince even the most conservative members of the profession of the advantages of reinforced concrete.

Concrete at the Building Exhibition.

At the Building Trades Exhibition at Olympia, a large number of the exhibits dealt with concrete and reinforced concrete.

Government Departments and Reinforced Concrete.

H.M. Office of Works have set the official seal upon reinforced concrete construction by applying it in the construction of the extension of the G.P.O., and in the building of the new Western District Post Office. The former is being carried out under Sir Henry Tanner, I.S.O., by Messrs. Holloway Bros., Ltd., contractors for the reinforced concrete work, as well as for the general finishing of the building.

We have referred above to the visit which was paid to this building by the members of the Concrete Institute, and also to their visit to the other building finished this year, namely, the Western District Post Office, which was constructed on the Coignet system by Messrs. W. King and Sons, contractors. That H.M. Office of Works are evidently favourably inclined to reinforced concrete construction may be inferred from the fact that in the past year tenders were invited for the erection of a new Money Order Office at Holloway, which contract was assigned to the same contractors as those employed for the Western District Post Office, this being also carried out by the same architect, Mr. J. Wager, H.M. Office of Works also invited tenders for work at Birmingham, and for the construction of new fireproof roofs to the National Gallery in reinforced concrete.

Local Government Board Apathy

The only official direction in which we have to chronicle a sad lack of appreciation, and apparently a determined effort to stand in the way of progress, is the action of the Local Government Board in refusing to grant loans on reinforced concrete construction for more than about ten to fifteen years. The life of reinforced concrete structures is fully equal to those on which the repayment of loan period is thirty years, and though the action of the officials of the Local Government Board has been called in question in Parliament, and whereas other branches of the public service, such as the War Office, the Admiralty, and H.M. Office of Works, have utilised the material extensively, yet nothing seems to move the Local Government Board. We hope that in due time this body may be persuaded of the error of its ways, but it is positively ridiculous for one official body thus to stand in the way of progress and set its face against scientific opinion.

The amendment of the London Building Act above referred to will have a great influence on building construction in London, and, perhaps, indirectly throughout the country. Considerable agitation is being directed to the endeavour to promote steel-frame construction in London in which the whole of the load is carried upon the steel frame, so that the walls can be reduced to a minimum thickness, and the necessity of constructing them in the same thickness from top to bottom, as required by the old London Building Act, obviated.

Steel-framed Buildings.

In connection with steel-frame buildings, reinforced concrete has found much favour for the construction of floor-slabs; but attached to the clauses of steel work construction we find others enabling the London County Council to permit the erection of reinforced concrete structures; and this we think perhaps of more importance, for it seems that reinforced concrete can successfully compete with steel work construction, and the latter will therefore occupy probably a secondary place. The rules have not yet been drafted, but buildings of the new construction are now permissible, and this permission should increase the use of reinforced concrete enormously.

Notable Examples.

In respect to other notable buildings in construction in the past year, we may first of all refer to the new Wesleyan Memorial Hall, in Westminster, which is being erected on the Kahn system. In this building there is a very large concrete dome, besides other interesting structural members. Another very interesting building in reinforced concrete is the new Y.M.C.A. building in Manchester, also on the Kahn system, in which the beams are of enormous size, as certain upper floors have to support unusual loads. At Kinlochleven, extensive works of reinforced concrete are being erected on the Coignet system for the British Aluminium Company. The culvert for the supply of water for power purposes in connection with the same is also formed of concrete reinforced with expanded metal.

Bridges.

An interesting road bridge, reinforced with expanded metal, has been erected at Thorverton, in Devonshire. Other bridges have also been carried out with reinforcement in expanded metal, a girder bridge at Chalderton, near Salisbury, for example. Tenders were invited in the past year for a large 134ft. single-span arch, 80ft. in width, to cross the river Mersey at Warrington. The system of reinforced concrete upon which this will be built has not yet been decided, but it shows the magnitude of the works which are being projected in this new construction. An interesting controversy took place in connection with the construction of bridges, the matter being one of dispute between the respective advocates of reinforced concrete and of steel work, for the re-erection of the bridge over the river Suir at Waterford, in Ireland. The original proposal for a steel structure may have been somewhat extravagant, but certainly the saving offered by the reinforced concrete scheme was very considerable, and it is probable that reinforced concrete will be adopted, though efforts are being made to reduce the cost of a steel structure. It has been decided to build a new bridge across the River Nore at Kilkenny, in place of the existing one. The total length is 196ft., and the width 30ft., and the centre arch will have a span of 140ft. In contrast with the action of the English Local Government Board, we may record the action of the Irish Board of Public Works, who have shown their confidence in reinforced concrete by extending the repayment of the necessary loan to 50 years.

As regards plain concrete, the most extensive construction completed this year is Dover Harbour, which was opened by H.R.H. the Prince of Wales. This is a gigantic work, but, of course, the use of concrete in mass or in monolithic blocks is not new. The example at Dover, however, is a striking one in respect to the great advantages which concrete offers to modern engineers.

Miscellanea.

Among the interesting applications of concrete is the construction of reinforced concrete pipes for water mains, sewers, etc., and the construction of reinforced concrete telegraph and electric power transmission poles. The Bonna and Siguit systems of making reinforced concrete pipes have received extended application in the past year. Concrete blocks for the construction of walls of all kinds have been proved now to be economical and suitable for the construction of small and large properties, from sheds and dwelling-houses up to churches and other monumental structures, and their use is growing. The efforts of the pioneer concrete block machine makers are gradually being awarded with success. We may refer to only that of the Newbiggin Colliery Co., Ltd., recently placed with the Wingett Concrete Construction Co., Ltd., for 602 miners' houses. Another interesting application is the use of reinforced concrete for the construction of fences, posts, etc. These have been extensively used in the United States, and they are coming into use in this country. An experimental fence has already been erected for the Great Eastern Railway Company.

Among the examples of reinforced concrete which have been erected in London during the last year, may be mentioned the recent plumbago mill, erected at Battersea for the Morgan Crucible Company, Ltd., the contractors for which are the Empire Stone Company, the reinforcement being patent indented steel bars.

Notable Works of the Year.

Among the numerous structures erected on the Kahn system in the past year, we may specially refer to as worthy of note, is a stand for the Rugby Football Union, the stores for the Bank of England at Roehampton, in both of which cases the Cubitt Concrete Construction Co. were the contractors; bathing pond at Castleton Baths; New South American Bank, Broad Street, London; block of warehouses at Watling Street; and the Kodak Company's factory at Harrow (D. G. Somerville and Co., contractors).

The British Reinforced Concrete Engineering Company, Ltd., had a successful year, their works comprising large railway culverts at Bromborough, bridges at Hallington and Swimburn, water towers at Castle Eden and Trafford Park, reservoirs at Titley and Huddersfield, warehouses at North Wales and on the Thames Embankment, machine shops and stores at Gourock, chemical works at Ditton, and other minor works.

On the Coignet system, in addition to above-mentioned works, were carried out workshop floors for Messrs. Henry Atkinson and Sons, Carlton Hall, Leeds; new pavilion for the Leeds Golf Club, Ltd.; floors at the Leeds Maternity Hospital, swimming bath at Yeadon and Guiseley Schools; the floors and roof for an hotel at Boar Lane, Leeds.

Messrs. The Empire Stone Co., Ltd., have been carrying out new offices for the Royal Mail Steam Packet Company at Kingston, Jamaica, and an extension to the Dunlop Rubber Company's works in Castle Lane, Birmingham.

The United Kingdom Fireproofing Co., Ltd., have carried out various works, among which may be mentioned the Doncaster Racecourse stands, New Barnet Church, Manchester Telephone Exchange, Epps's Cocoa Factory, and Panton Street Brewery, Cambridge, also the Northern Assurance Buildings at Glasgow.

The Patent Indented Steel Bars have been employed in many buildings in the past year—too numerous, in fact, to be mentioned in detail, but we may refer specially to the Automobile Club in Pall Mall, London, the floors and retaining walls of which are of concrete reinforced with indented bars. Water towers at Rhyl and Leicester, retaining walls at Wembley, sea wall at Teignmouth, Fortt's premises at Bath, baths at Heeley and Glossop Road and Madeley Street, Sheffield, floors of schools at Maidstone, Ramsgate, Bromley, and Sheerness.

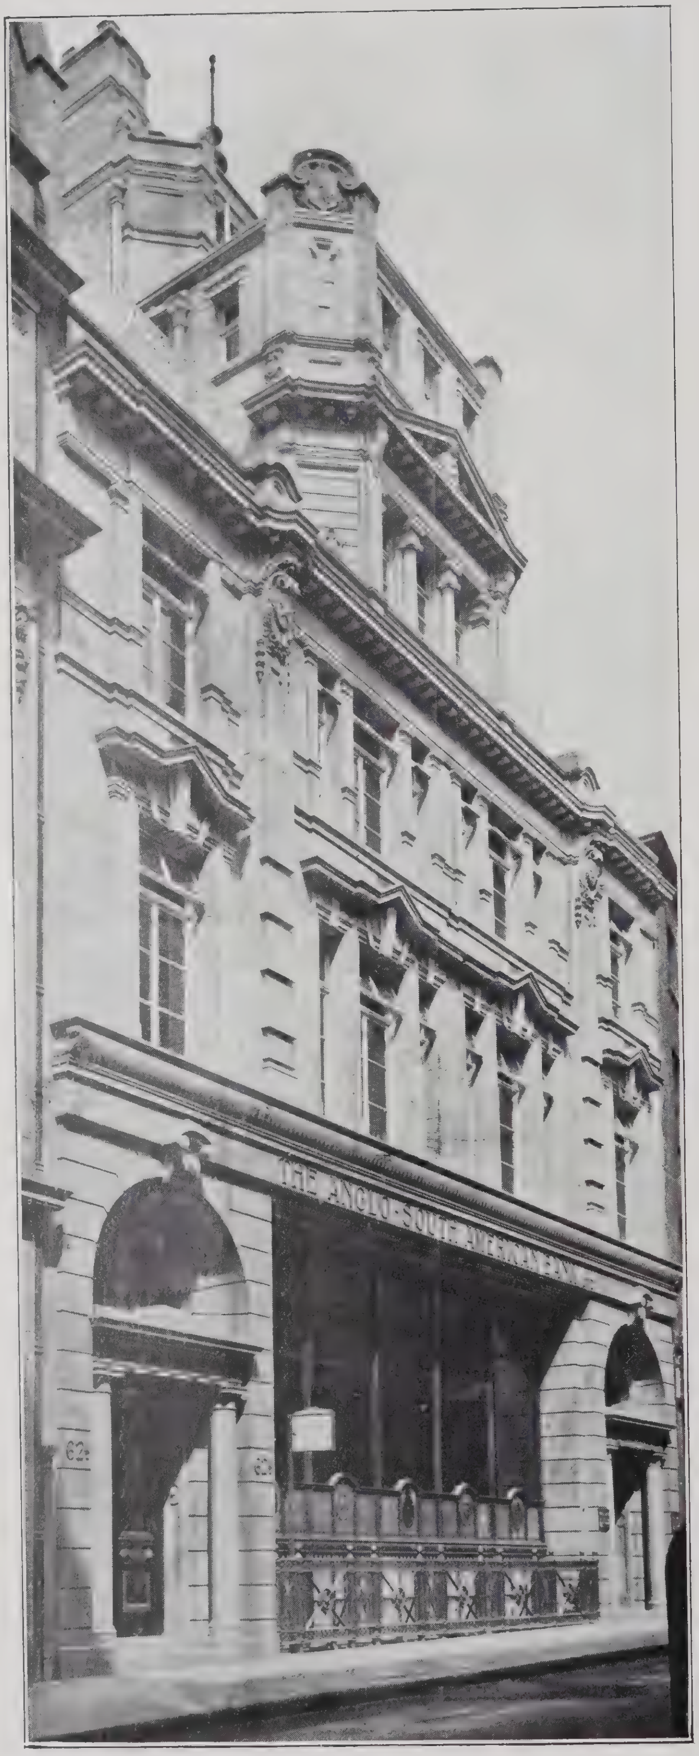
Messrs. The Cubitt Construction Co., Ltd., carried out some large works for Messrs. Whitbread and Co., at Chelsea, in addition to those already mentioned.

Messrs. D. G. Somerville and Co. carried out a viaduct with reinforced concrete poles for the Norwich Corporation, water tower at Portslade, and a water tower at Leicester, and Chilham bridge.

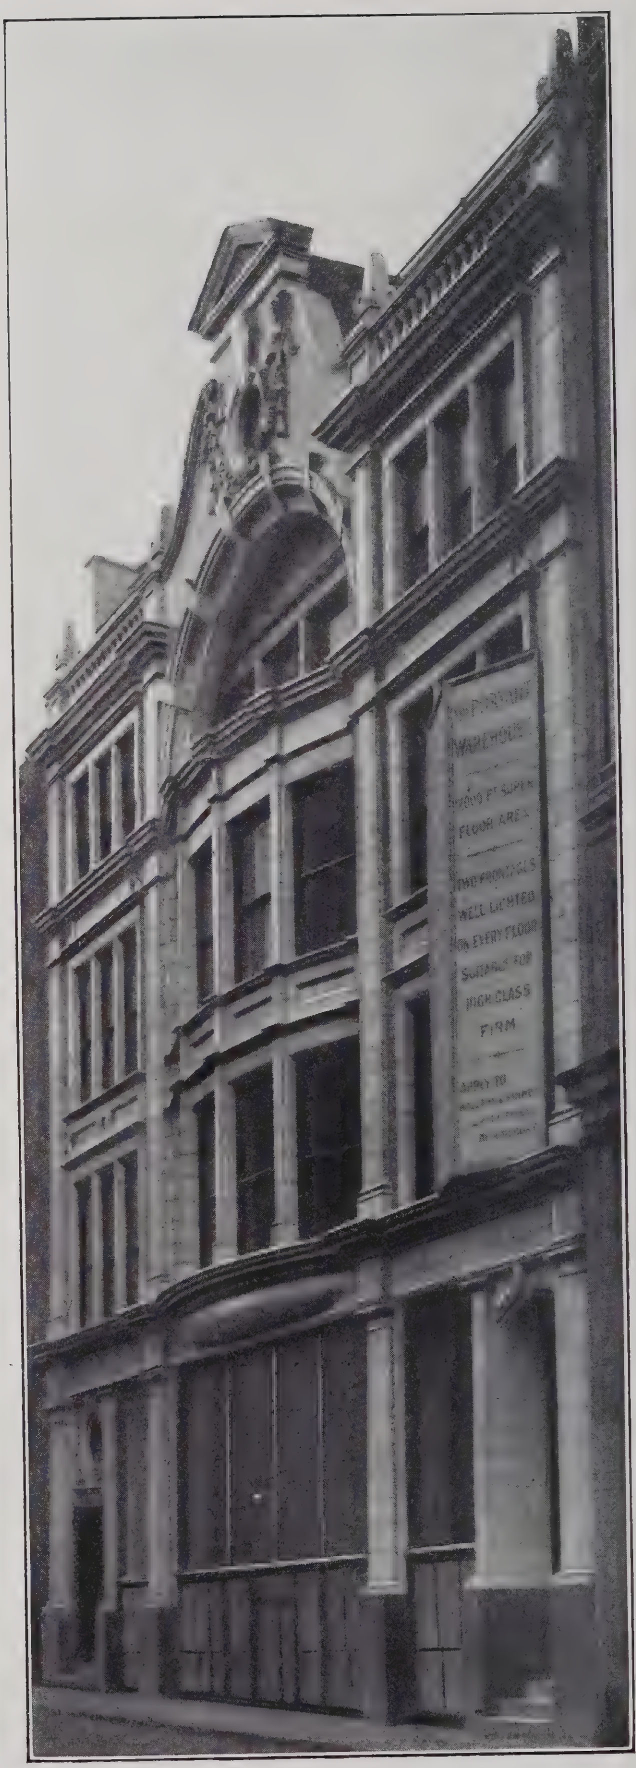
The Armoured Tubular Flooring Co. carried out a factory at Bromsgrove, floors of a boot factory, and Bromsgrove Secondary School at Sowerby Brigg, at Foundry, Belfast, at the new Royal Infirmary, Sheffield, and at the new Secondary Schools at Barnstaple, and at the Great Western Hotel at Fishguard Bay.

Messrs. Leslie and Co., Ltd., carried out percolating beds at Kempton Park, at Staines in connection with works for the Metropolitan Water Board, foundations to the new South Kensington Post Office, the Strand Palace Hotel, London; bridge work at Barton Mills for the West Suffolk County Council; new factory at Bow for Messrs. Bryant and May, Ltd.

The Expanded Metal Co. have so many buildings as to preclude a list, but eleven important works are shown in the following pages.

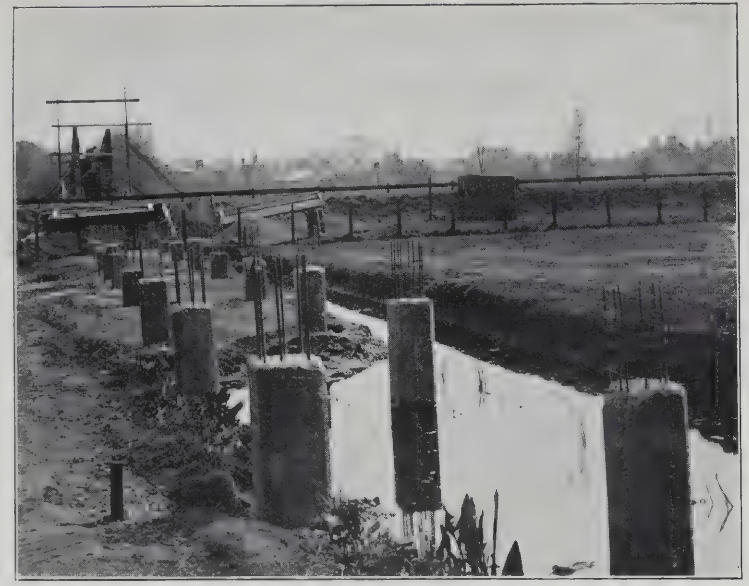


ANGLO-SOUTH-AMERICAN BANK, BROAD STREET LONDON E.C.

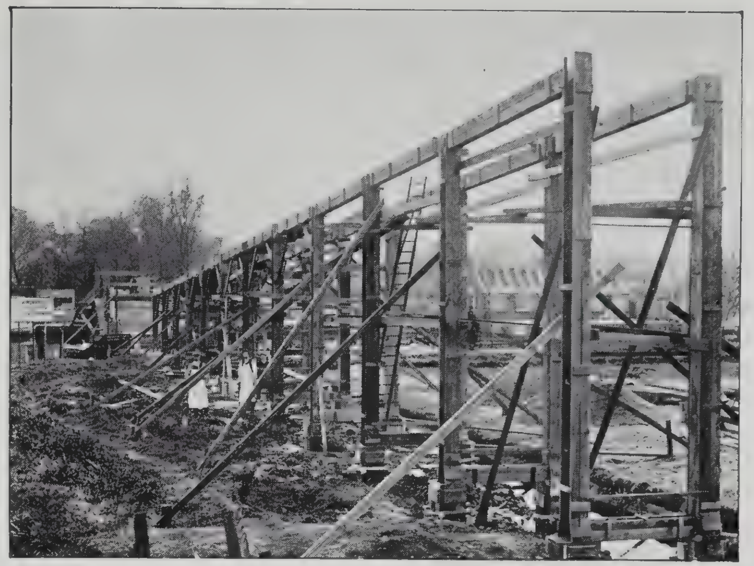


WAREHOUSES, WATLING STREET, LONDON E.C.

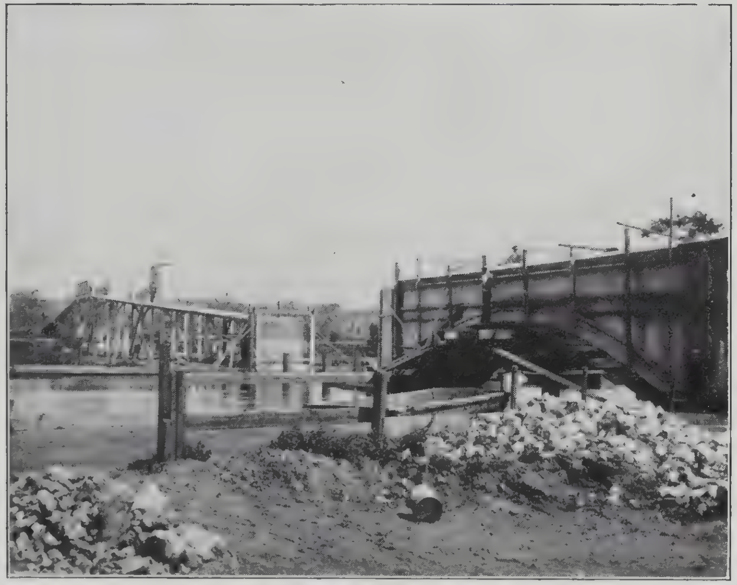
(Kahn Reinforcement.)



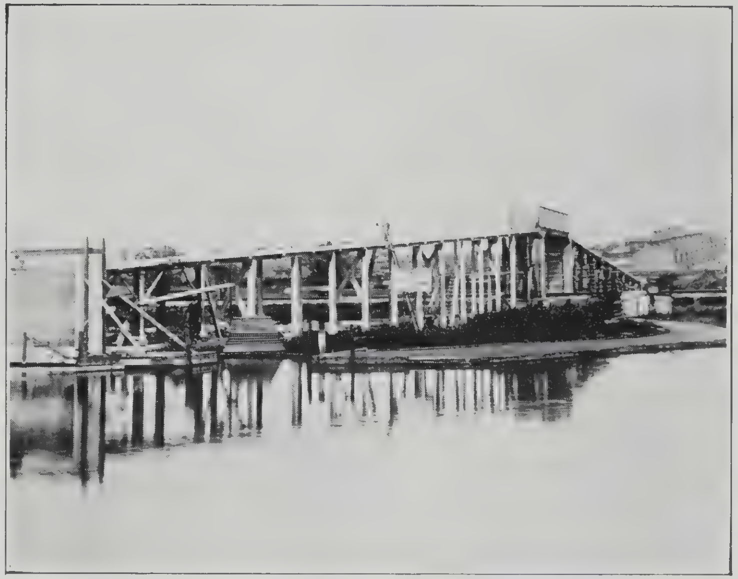
Piles for Foundation.



Centering in Position.

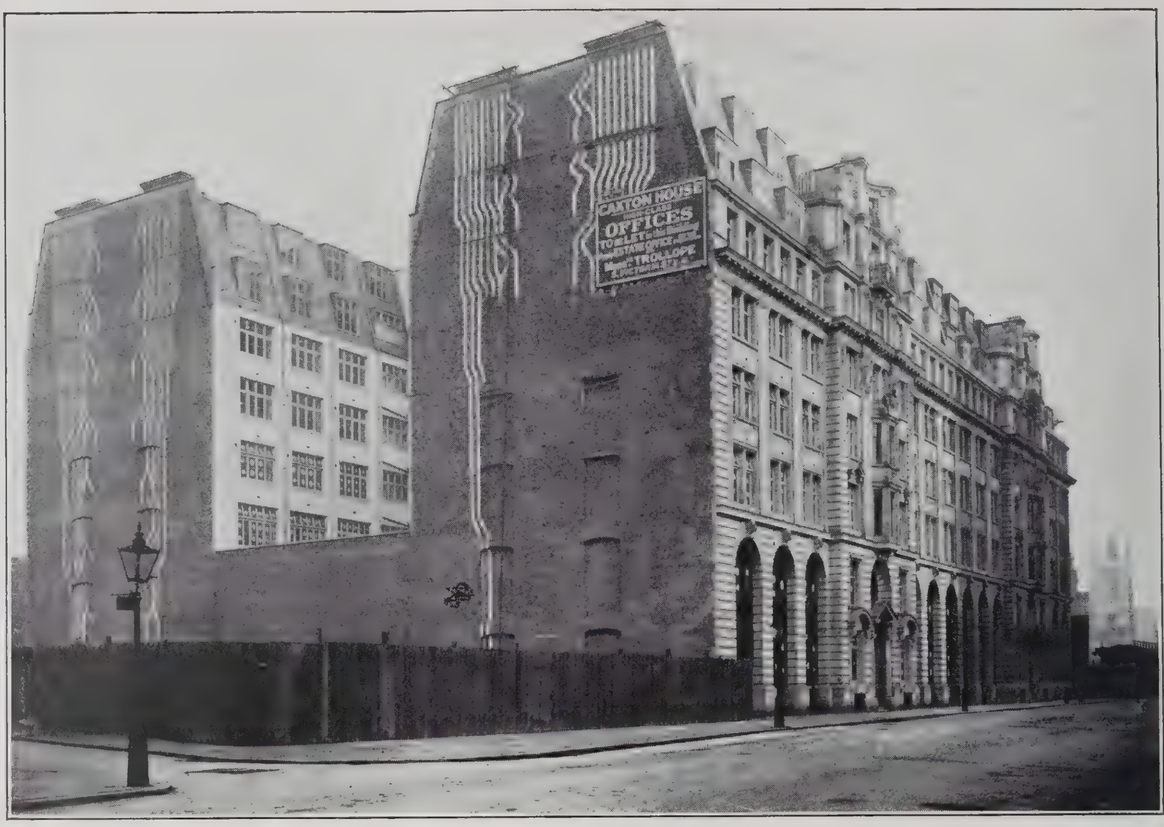


Nearing Completion.

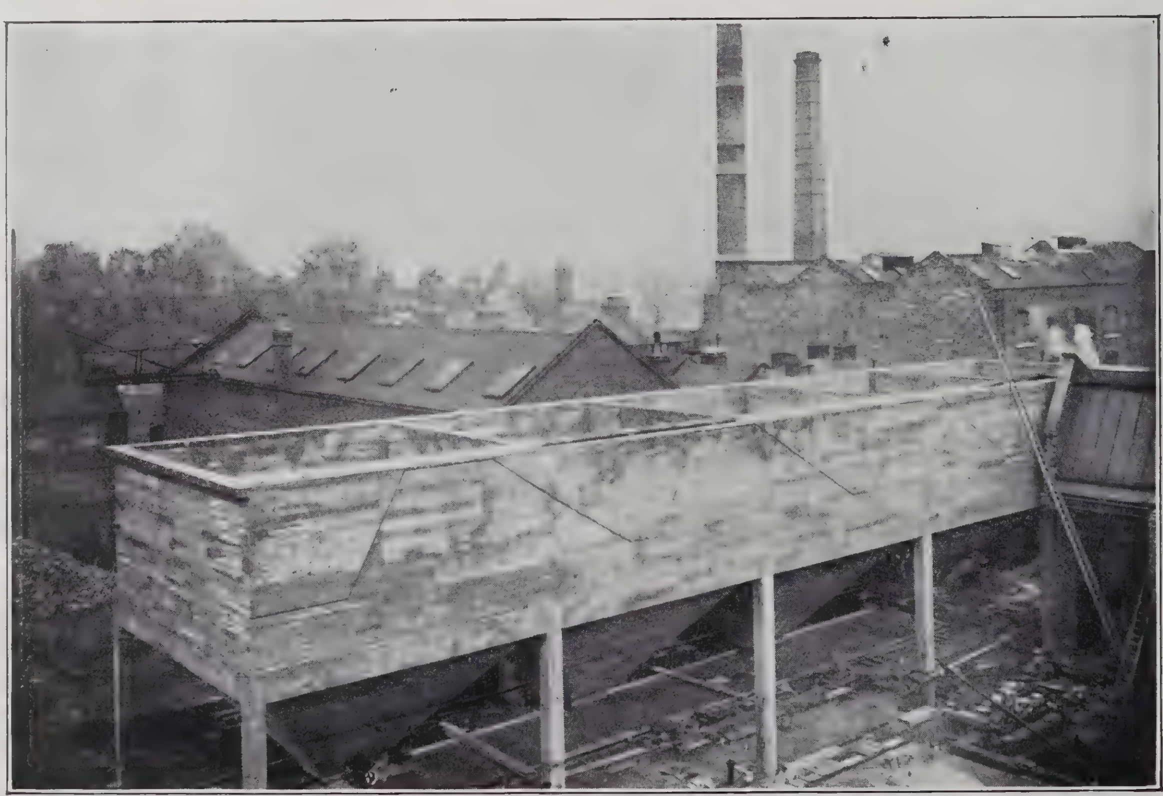


Viaduct Completed.

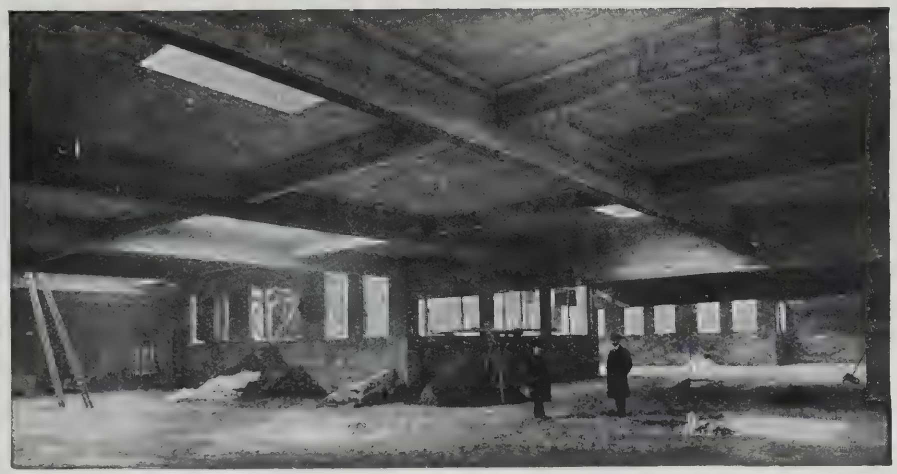
THE DOLPHIN BRIDGE AND VIADUCT, CONNECTING LOWER HELLESDON WITH_NORTH HEIGHAM, NORWICH. A. E. COLLINS, M.Inst.C.E., ENGINEER.
(D. G. Somerville and Co., Contractors.)



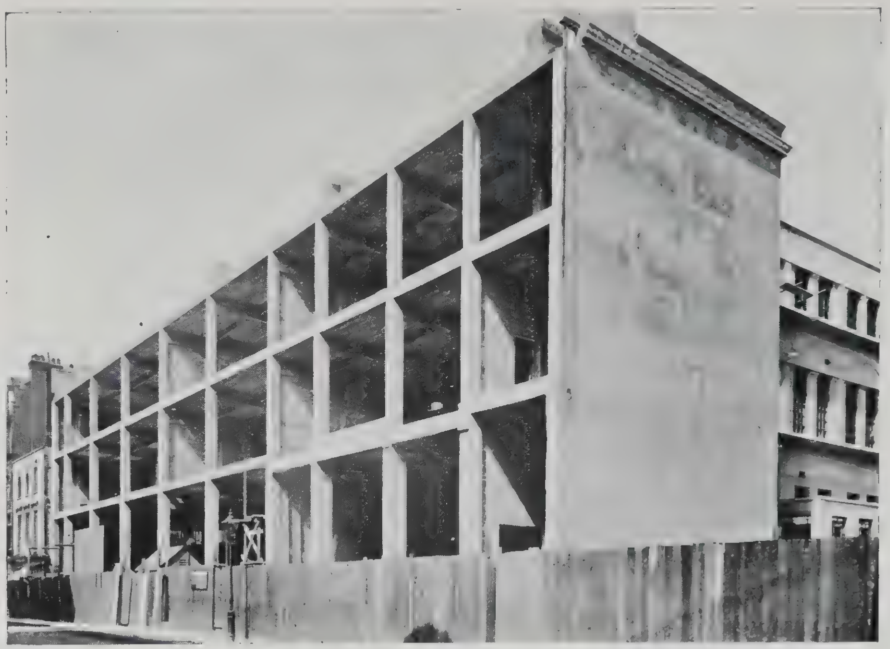
CAXTON HOUSE, WESTMINSTER, SHOWING NEW WEST BLOCK. J. S. GIBSON, F.R.I.B.A., ARCHITECT.



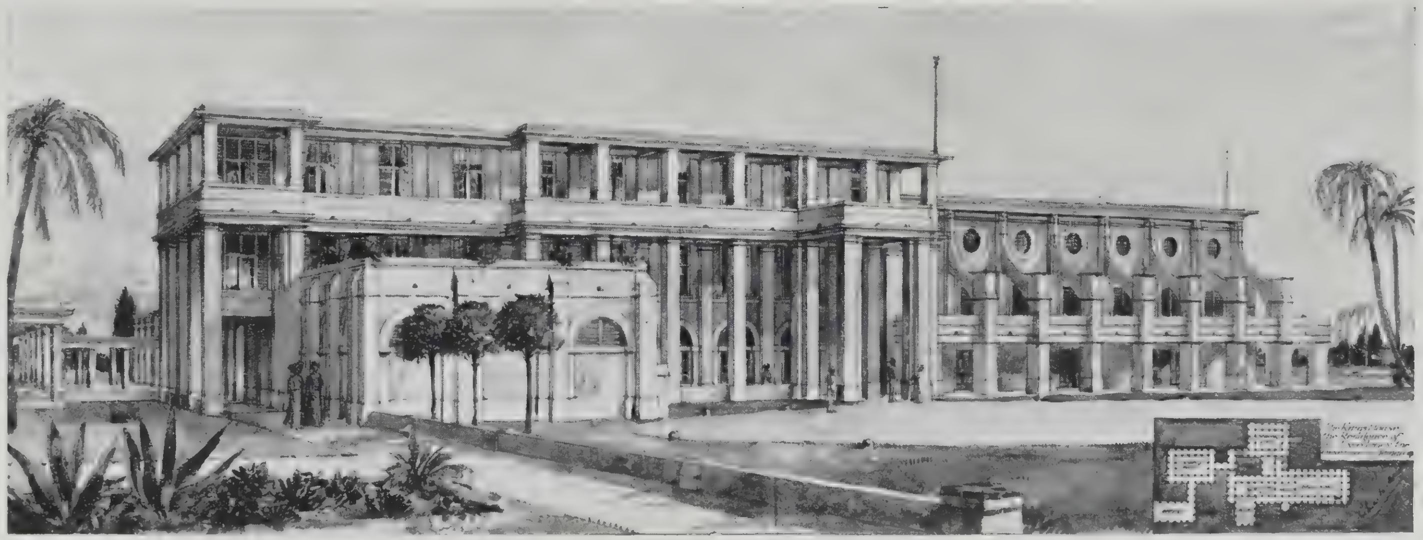
COAL BUNKERS AT HAMMERSMITH FOR THE METROPOLITAN WATER BOARD.
Wm. B. BRYAN, M.Inst.C.E., CHIEF ENGINEER.
(Holloway Bros., Ltd., Contractors.)



WESTERN DISTRICT POST OFFICE, WIMPOLE STREET, LONDON: INTERIOR OF GROUND FLOOR. J. WAGER, A.R.I.B.A. (H.M. OFFICE OF WORKS).



WESTERN DISTRICT POST OFFICE, WIMPOLE STREET, LONDON. J. WAGER, A.R.I.B.A. (H.M. OFFICE OF WORKS).



THE KING'S HOUSE, KINGSTON, JAMAICA. NICHOLSON AND CORLETTE, FF.R.I.B.A., ARCHITECTS.

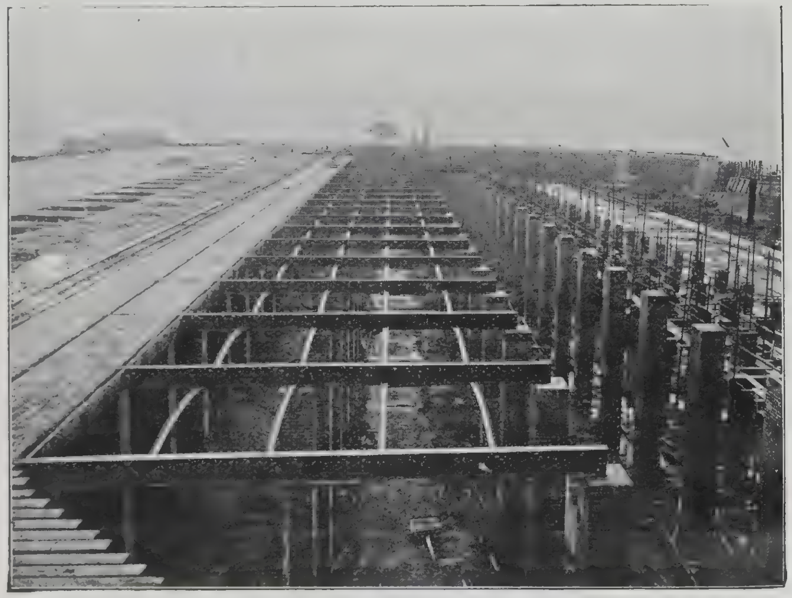
Reinforced Concrete Foundations and Lining.
RESERVOIR AT WHALEY BRIDGE. FRED OAKES AND SONS, ENGINEERS.

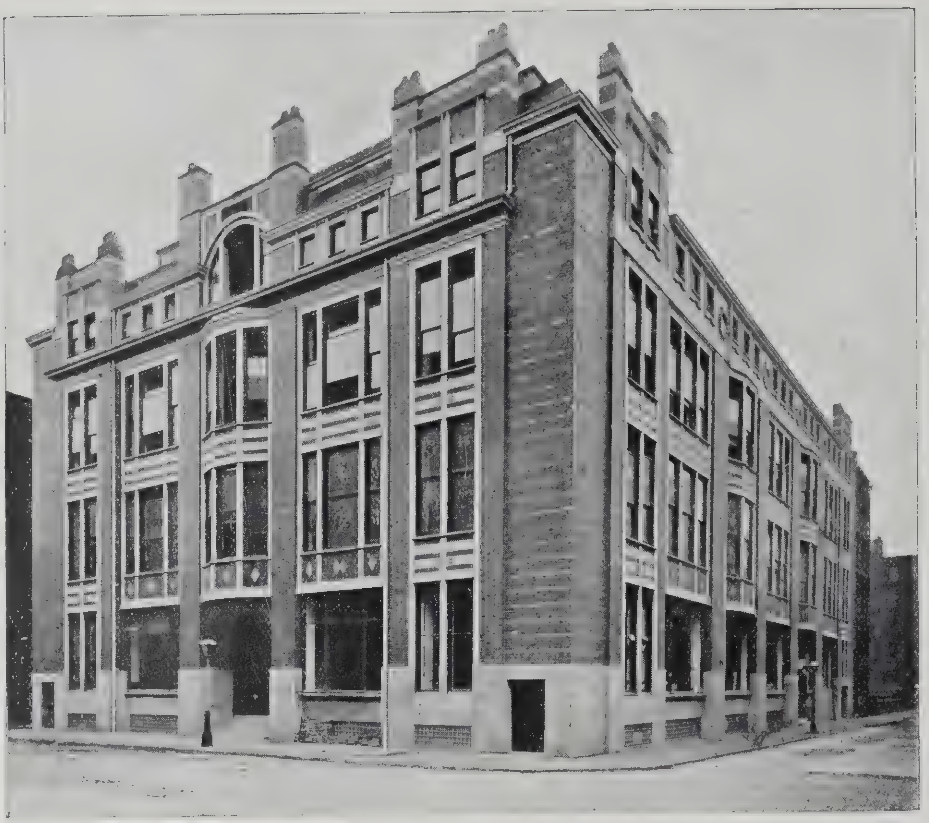
Reinforced concrete barrel roofs and domes.
OLDKNOW ROAD SCHOOLS, BIRMINGHAM. BUCKLAND AND HAYWOOD-FARMER, ARCHITECTS.



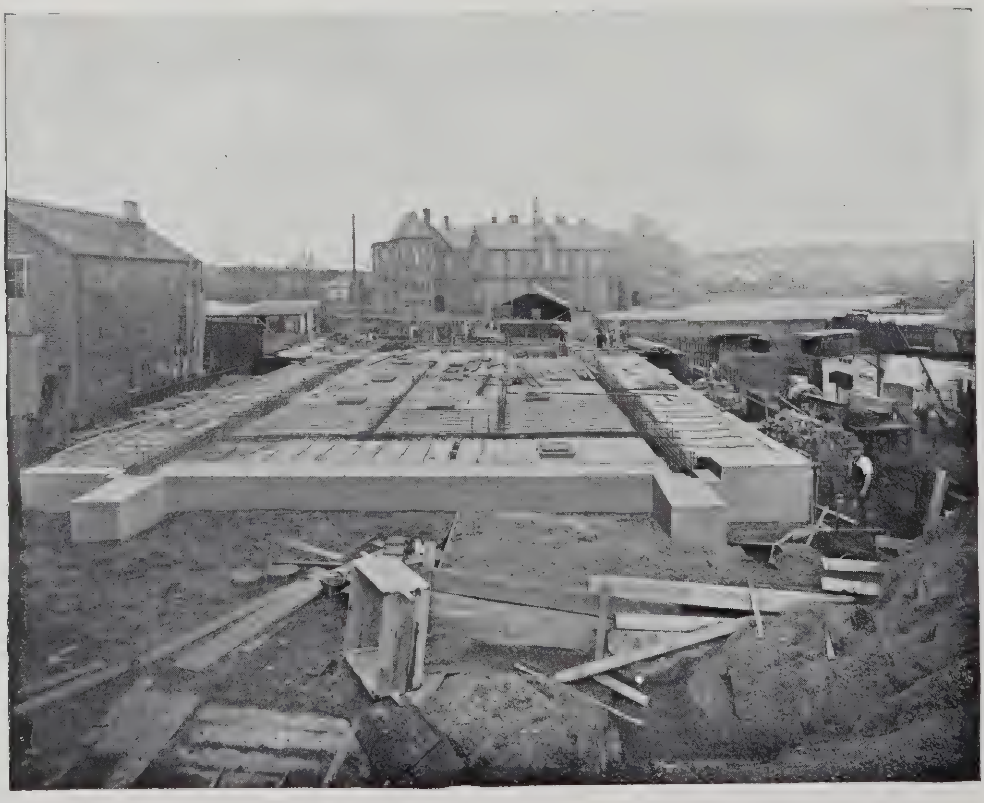
Reinforced Concrete Cover, 624 ft. by 360 ft.
DERWENT AQUEDUCT, AMBERGATE RESERVOIR. E. SANDEMAN, M.Inst C.E., ENGINEER.

Reinforced Concrete Ponds, Bridges, Retaining Walls, Flooring, etc.
SALFORD PUBLIC BATHS. MAGNALL AND LITTLEWOOD, ARCHITECTS.

(Expanded Metal Reinforcements.)



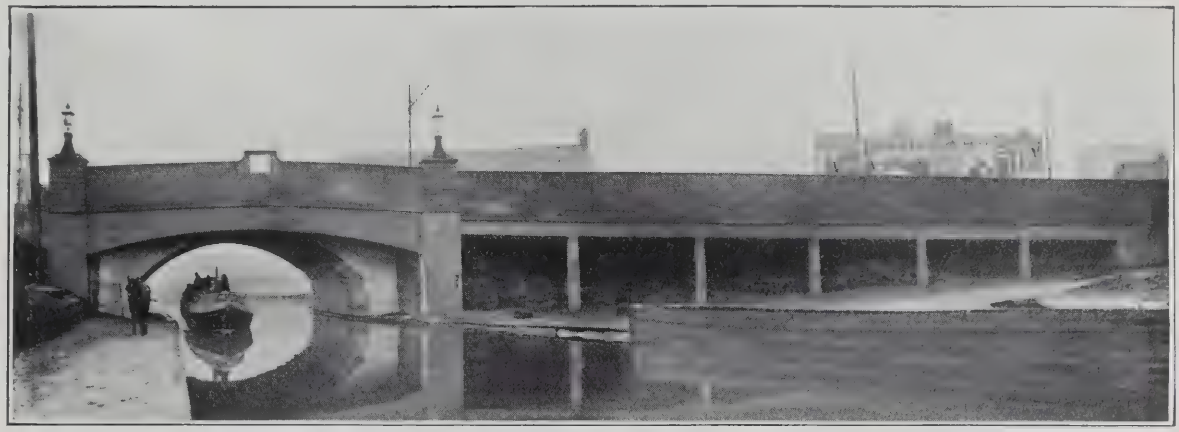
MANCHESTER TELEPHONE EXCHANGE. LEONARD STOKES, F.R.I.B.A., ARCHITECT.



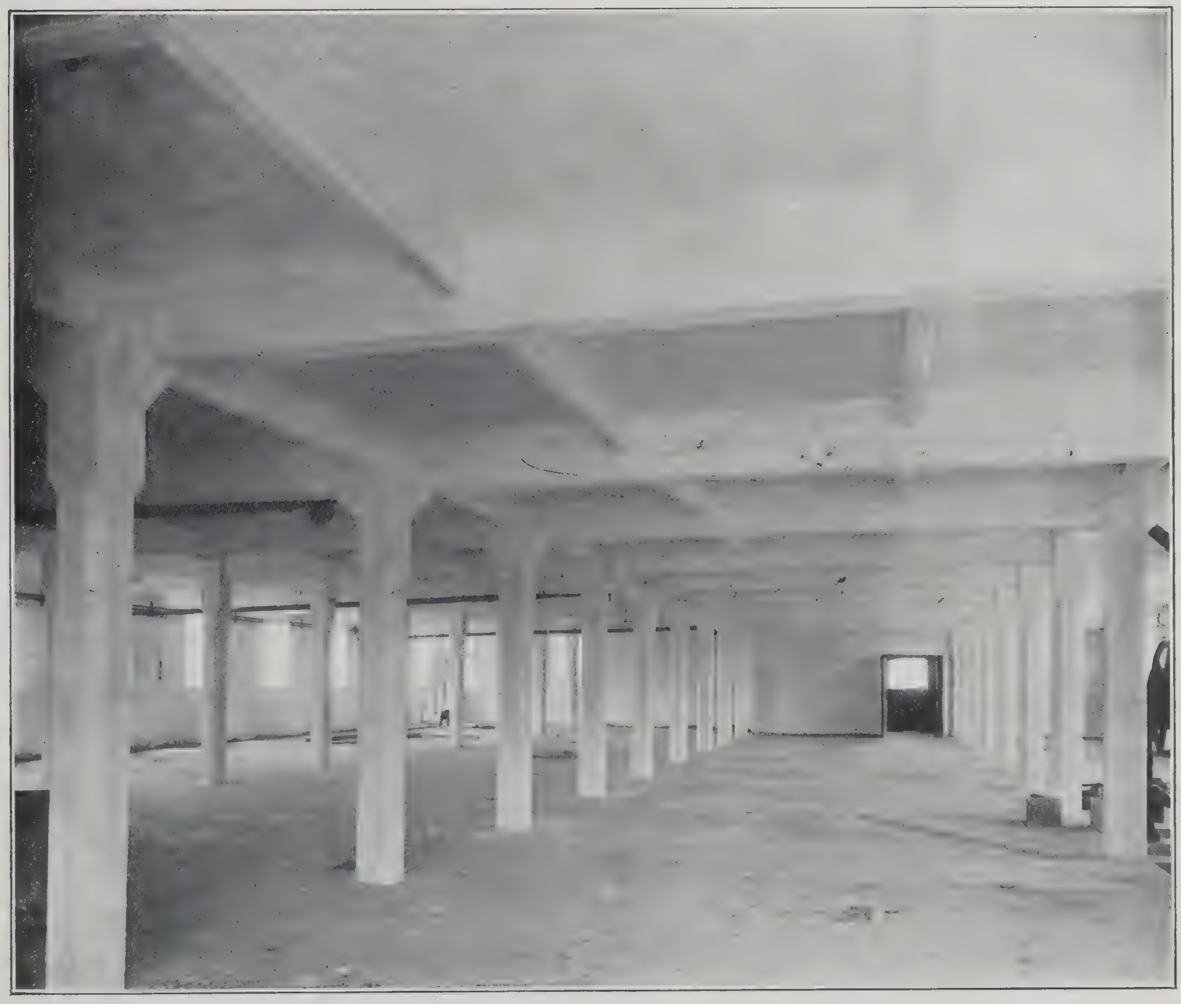
NEW BARNET CHURCH.

The whole of the foundations, stanchions, beams, etc., of this building have been constructed in reinforced concrete.

(United Kingdom Fireproofing Company's Reinforcement.)

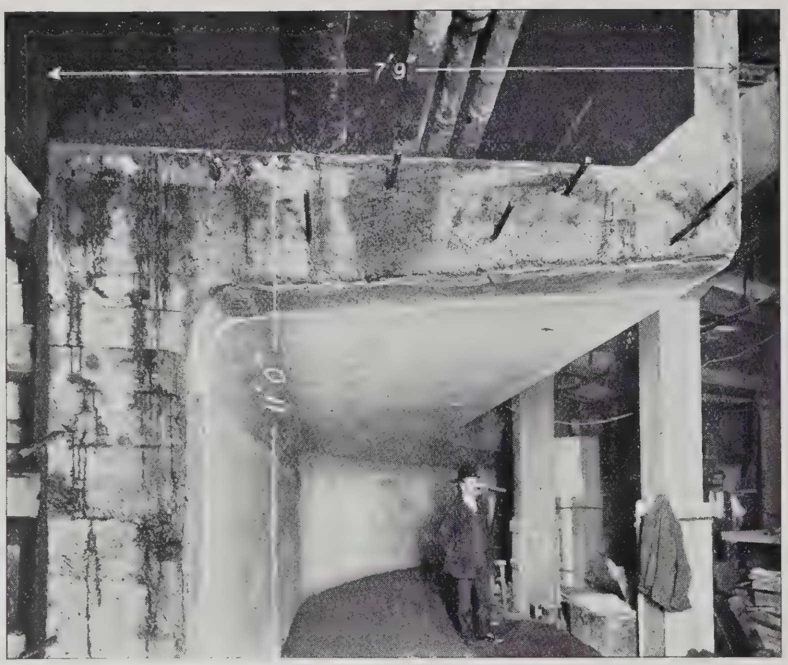


BRIDGE AND VIADUCT AT BROADHEATH.



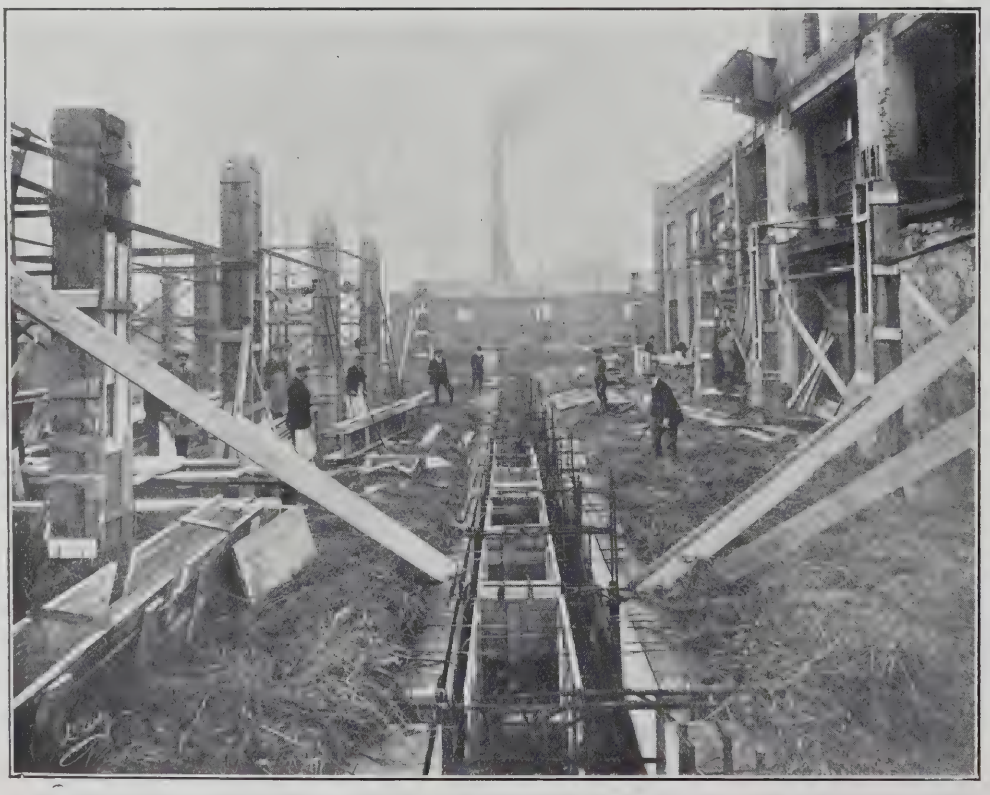
STORES FOR MESSRS. WHITBREAD AND CO., CHELSEA.

(Cubitt Concrete Construction Co., Contractors. Built with Saxon Portland Cement.)



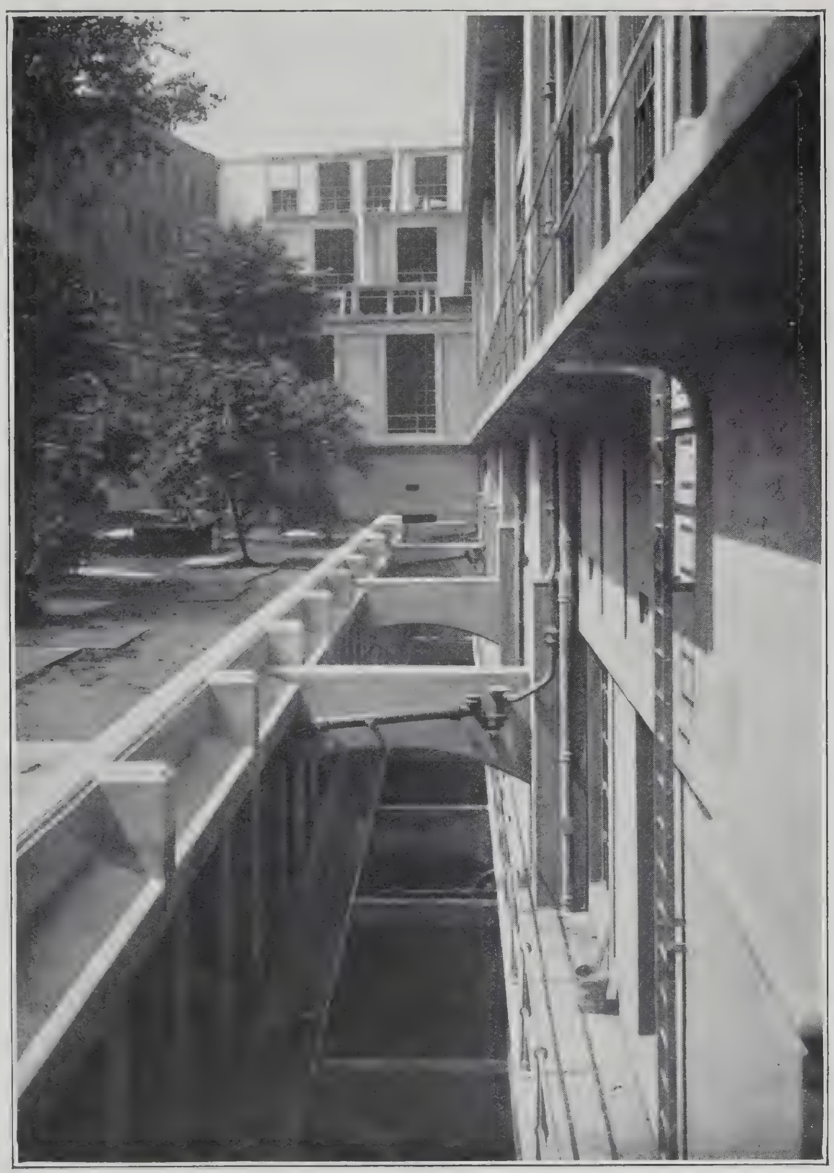
RETAINING WALL, MESSRS. MAPPIN AND WEBB'S PREMISES, CHEAPSIDE AND QUEEN VICTORIA STREET, LONDON, E.C. A. DREW, CONSULTING ENGINEER.

This retaining wall, only 14 in. thick, supports the exceptionally heavy motor traffic, etc., along Cheapside and Queen Victoria Street. The cantilever forms the sole support of pavement and all pipes, mains, etc.

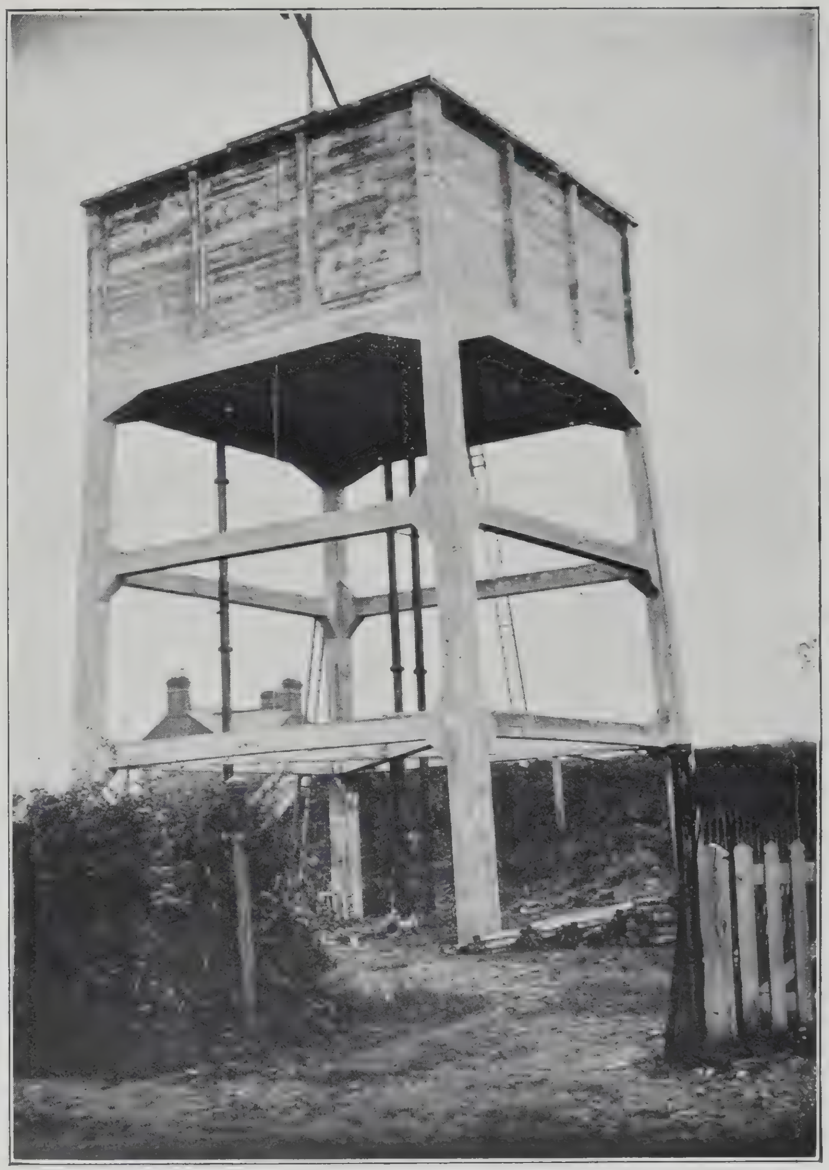


JAM FACTORY, DUBLIN, IN COURSE OF CONSTRUCTION FOR WILLIAMS AND WOODS, LTD. DONNELLY AND MOORE, ARCHITECTS.

The whole framework of the building, including four floors, flat roof, columns, balconies, and basement retaining walls, is constructed in reinforced concrete. The floors have been designed to carry very heavy loads, as much as 8 cwts., per foot super in one case. There is also a suspended gallery, and a tunnel is included in the scheme of reinforced concrete.
(Indented Bar Reinforcement.)

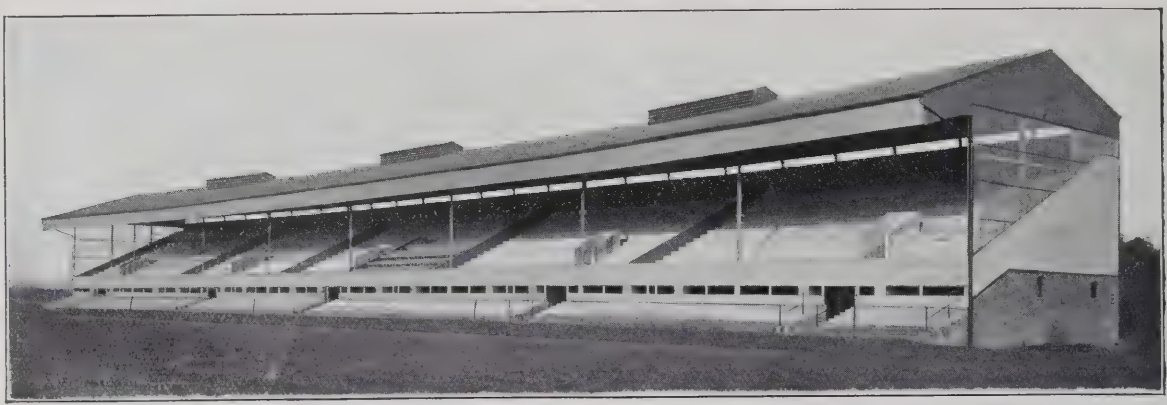


NEW GENERAL POST OFFICE BUILDING: SOUTH ELEVATION, SHOWING CANTILEVER BALCONIES AND SOUTH RETAINING WALL AND STRAPS.

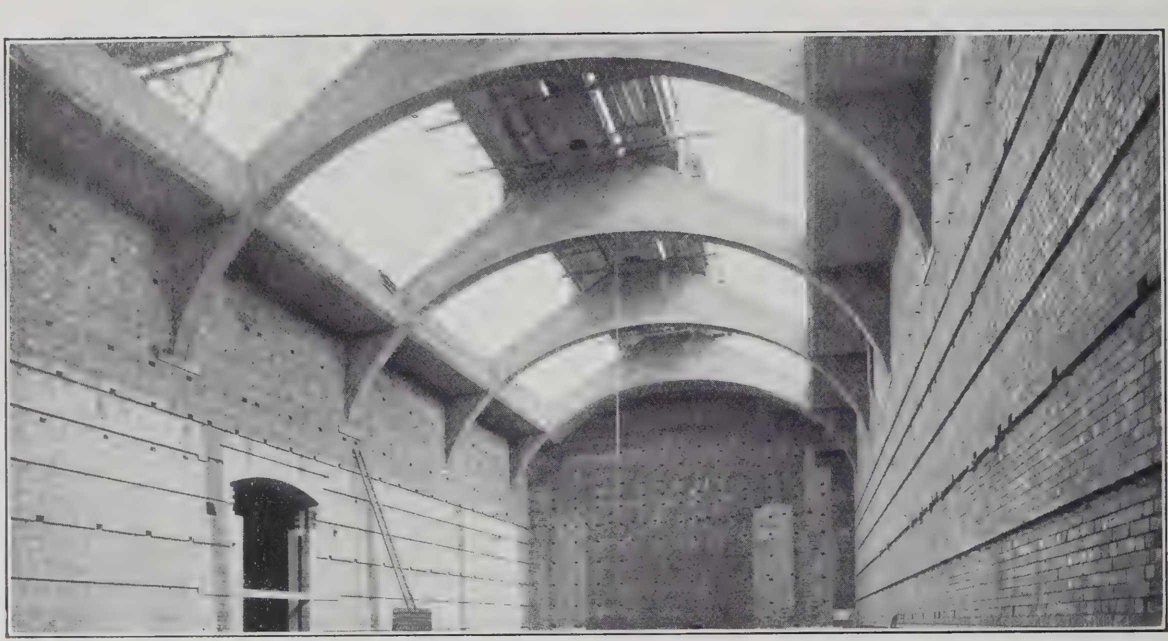


WATER TOWER, TO HOLD 30,000 GALLONS, FOR THE GREAT MARLOW WATER CO.

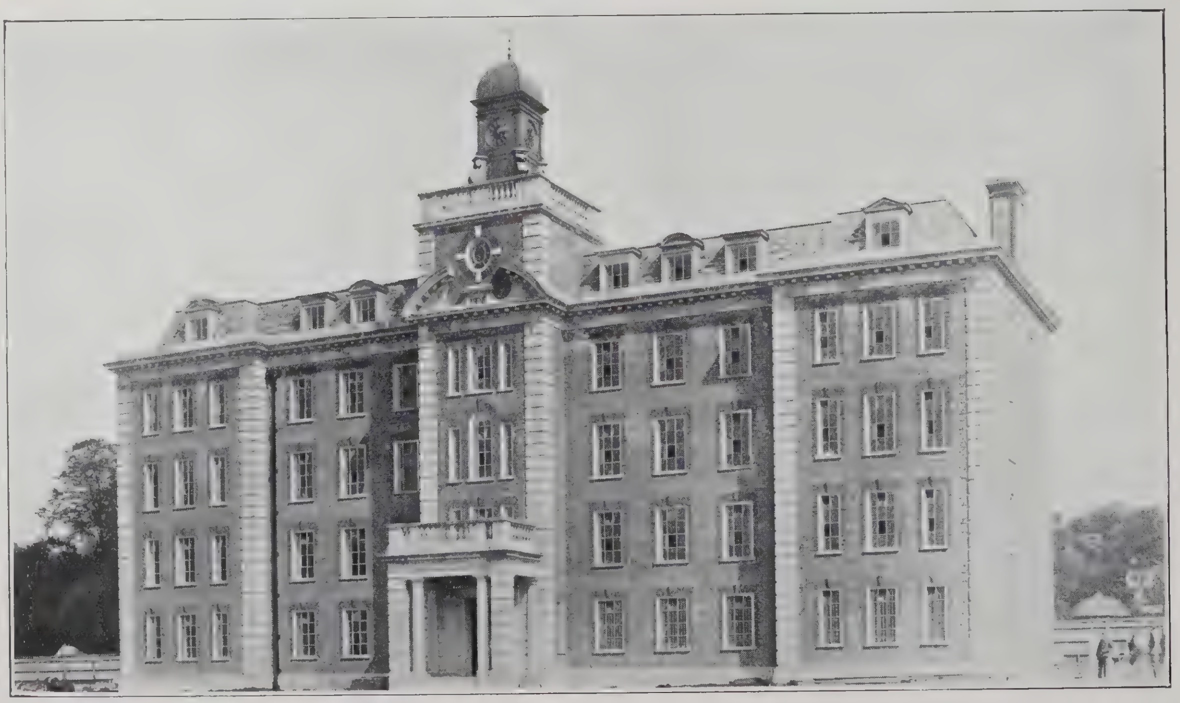
(Holloway Bros., **Ltd.**, **Contractors.**)



GRAND STAND FOR THE RUGBY FOOTBALL UNION, TWICKENHAM.



ROOF TRUSSES, NATIONAL GALLERY, LONDON.



BANK OF ENGLAND RECORDS OFFICE, ROEHAMPTON. A. C. BLOMFIELD, F.R.I.B.A., ARCHITECT.
